### THE 'LINEAR STANDARD' 20-WATT PRE-FAB AMPLIFIER

*Second to None in Quality  
and Performance*

Yes, just tighten 17 screws, in 17 minutes, connect your completed UTC Pre-Fab Amplifier into your Hi-Fi system, then sit back and enjoy the most spine-tingling tones you ever heard through your music system. And all you have used is a screwdriver.

The UTC 'Linear Standard' is the first pre-engineered, pre-fabricated, pre-assembled amplifier kit ever offered to the home building audio fan, that employs the latest and most advanced techniques including the printed circuit. You needn't know a tube from a condenser, just how to use a screwdriver.

More than a year of top level UTC engineering has gone into this amplifier to produce the cleanest, purest, response you have ever heard. It's absolutely linear: no positive feedback, hence no response peaks at either end of the spectrum. Excellent damping and transient response . . . no hangover on low frequencies to cause boominess . . . no high frequency ringing. In short, just pure, clean, true-to-life response that sounds as good as it tests on the meter.

And it's the **only** amplifier with a feedback circuit so stable that any one of the tubes can be replaced and still be perfectly matched to its twin, with no critical circuit readjustments necessary.

It is the finest amplifier you can own, and you can proudly say, "I built it myself."

Net  
\$108.00

**UNITED TRANSFORMER CO.**

NEW YORK 13, N. Y.

## THIS MAN IS DESTROYING TUBES THAT WON'T MEET STIFF G-E TESTS

THEY'RE being ground to powder, in a G-E factory machine that awaits tube rejects. All General Electric tubes must demonstrate satisfactory performance before they're cartoned and shipped . . . any tubes that fail in final tests are destroyed as completely unusable.

No "seconds", so-called, can leave a General Electric tube plant! The new G-E tube you buy is a first-grade product in every case.

Observing this single standard of quality are seven G-E plants with the largest tube manufacturing area in the industry . . . staffed with many thousand trained employees using the most modern precision tube-building equipment, much of it designed throughout by G.E.

See your General Electric tube distributor today for tubes that are manufactured to one standard of quality only . . . the highest!

*Progress Is Our Most Important Product*

The 353D-series Adapter in the National HRO-50 or HRO-50T1.

Popularity of Collins Mechanical Filters and Mechanical Filter Adapters in the 75A Amateur Receivers has resulted in many requests for Mechanical Filter Adapters designed for use in other popular receivers.

The advantages of the mechanical filter approach to receiver selectivity may be immediately recognized. For instance, Filter Adapters eliminate problems normally associated with improving receiver selectivity. Installation requires only that an IF tube be removed and the Filter Adapter plugged into its socket. No modification or disfiguration is necessary. The Collins Mechanical Filter Adapter is self-contained, permanently tuned, and power and signal circuits are obtained from the tube socket. Gain of the Filter Adapter matches that of the IF tube replaced.

The convenient plug-in feature of the Filter Adapter provides a means for selecting a choice of bandwidth for reception of CW, AM, SSB or FSK. For example, the 800 cycle bandpass Adapter may be plugged in for CW reception; the 1.2 kc Adapter for either CW or FSK; the 3.1 kc Adapter for AM or SSB; and the 6.0 kc Adapter for AM.

## MECHANICAL FILTERS ALSO AVAILABLE

Amateurs desiring Filters for application to other equipments now have a choice of center frequencies at 500 kc, 455 kc, and 250 kc — and bandwidth characteristics to fulfill most operating needs. In the F455-series (455 kc), bandwidths are established at 0.8 kc, 1.2 kc, 3.1 kc, and 6.0 kc. The F500-series (500 kc) provides a bandwidth choice of 1.4 kc, 3.1 kc, and 6.0 kc. For SSB reception with a 250 kc IF, the 250Z-series provides 3.2 kc bandwidths. A 6.7 kc bandwidth is available in the F250A-67 for receivers with a 250 kc IF.

F455-series \_\_\$35.00 F250Z-series (3.2 kc)\_\_\_\$60.00  
F500-series \_\_\$35.00 F250A-67 (6.7 kc)\_\_\_\$45.00

## FREE LITERATURE AT YOUR REQUEST

Booklets describing Mechanical Filters and Mechanical Filter Plug-In Adapters are available. Included are response curves, detailed theory of operation, circuit applications, and other informative data. See your local distributor or contact a Collins Sales Office.

Model SX-96 SELECTABLE  
SIDEBAND RECEIVER

# hallicrafters

Chicago 24, Illinois

In Canada:

THE HALLICRAFTERS COMPANY • Don Mills Road • Box 27, Station R • Toronto 17, Ontario, Canada

## HALLICRAFTERS

- Covers Broadcast 538-1580 kc plus three S/W 1720 kc—34 Mc.
- Precision gear drive dial system.
- Double conversion with selectable crystal controlled second oscillators
- Selectable side band reception of both suppressed carrier and full carrier transmissions.
- Highly selective 50 kc I. F. system.
- CW operation with AVC on.
- Delayed AVC.
- Calibrated bandspread—"S" meter—double superhet.
- 10 tubes, 1 rectifier and voltage regulator.

NOW AVAILABLE AT NO EXTRA COST

SSB

PR CRYSTALS FOR 75 METER  
AND 20 METER PHONE...IN  
THE 5 TO 5.5 MC. RANGE

Now you can enjoy commercial crystal stability on SSB at amateur prices. Because of increased

demand, PR is now making available Type Z-2 Crystals in the 5 to 5.5 MC. range at \$2.95 . . . for use with SSB exciters, such as the 10B and 20A for operation in the 75 meter and 20 meter phone bands. Pick your frequencies (integral kilocycle) and order from your dealer at this new, low price. Formerly PR crystals in this range were available only in commercial types selling for several times this amount.

5.0 MC. to 5.5 MC. Range

On SSB, where stability becomes of utmost importance, there's nothing like crystal control with PRs . . . negligible drift (limited to less than 2 cycles per MC. per degree C). You can avoid the continuous annoyance of drift by depending on PRs . . . then you **KNOW** where you are, and you know you will stay there!

PR Crystals

USE **PR** AND KNOW WHERE YOU ARE

## Section Communications Managers of the ARRL Communications Department

**Reports Invited.** All amateurs, especially League members, are invited to report station activities on the first of each month (for preceding month) direct to the SCM, the administrative ARRL official elected by members in each Section. Radio club reports are also desired by SCMs for inclusion in *QST*. **ARRL Field Organization station appointments** are available in the areas shown to qualified League members. These include ORS, OES, OPS, OO and OBS. SCMs also desire applications for SEC, EC, RM and PAM where vacancies exist. *All amateurs* in the United States and Canada are invited to join the Amateur Radio Emergency Corps (ask for Form 7).

# THE AMERICAN RADIO RELAY LEAGUE, INC.,

is a noncommercial association of radio amateurs, bonded for the promotion of interest in amateur radio communication and experimentation, for the relaying of messages by radio, for the advancement of the radio art and of the public welfare, for the representation of the radio amateur in legislative matters, and for the maintenance of fraternalism and a high standard of conduct.

It is an incorporated association without capital stock, chartered under the laws of Connecticut. Its affairs are governed by a Board of Directors, elected every two years by the general membership. The officers are elected or appointed by the Directors. The League is noncommercial and no one commercially engaged in the manufacture, sale or rental of radio apparatus is eligible to membership on its board.

"Of, by and for the amateur," it numbers within its ranks practically every worth-while amateur in the nation and has a history of glorious achievement as the standard-bearer in amateur affairs.

Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification; ownership of a transmitting station and knowledge of the code are not prerequisite, although full voting membership is granted only to licensed amateurs.

All general correspondence should be addressed to the administrative headquarters at West Hartford, Connecticut.

# "It Seems to Us..."

## THE YEAR IN REVIEW

In 1954 the American Radio Relay League marked the 40th year of its founding as a non-profit membership association "of, by and for the radio amateur." It was a banner year in most respects. Full membership reached the highest figure in our history, and the proportion voting in the autumn director elections showed this to be an active, participating interest on the part of members in their national association. *QST* continued to grow in size and scope, perhaps soon to present another problem of enlarging the yearly binders so that twelve issues can be fitted into them!

At yearend a new publication, *Single Sideband for the Radio Amateur*, appeared in order to cater to and encourage amateur use of this growing field. Considerable publicity on the attractiveness of amateur radio as a hobby appeared in various magazines, resulting in thousands of inquiries to Headquarters on how to get into the hobby, and also resulting in a heavy demand this year for "beginner" publications. The 1954 financial statement will again show new highs in gross income and outgo.

While it is only late November as we write, it appears unquestioned that amateur radio itself is reaching a peak of growth, totaling perhaps 125,000 licensees. During the early part of the year a license fee seemed imminent, but it has since been pigeonholed. A major change occurred in June with the placing of Novice and Technician Class examinations on a mail-only basis, so that with the reduced distance for Conditional Class eligibility, amateurs themselves are conducting more than half of FCC exams for newcomers. New questions were added to the General Class exam to expand its scope and bring it up to date. The requests to increase the size of the voice allocation at 14 and 28 Mc. were turned down by FCC. Duplex operation on 50 Mc. was authorized, as was maritime mobile use of 21 Mc. General approval was given to the security control program, "Conelrad," for amateurs, with specific proposed regulations to follow. The League was signally honored with the visit, in January, of five members of the Federal Communications Commission and two staff Bureau heads.

Despite generally poor conditions for DX, more than 2600 amateurs have now qualified for the DX Century Club roster. They, with DXCC aspirants, are encouraged by the knowledge that as the sunspot cycle swings to a more favorable point, propagation conditions are rapidly improving and the now-occasional openings of 21 Mc., for example, will soon become everyday occurrences. With more than 8000 individual participants reported, manning more than 2000 transmitter-receiver installations, the ARRL Field Day was again the biggest ever. From the roars of "CQ SS" that covered the bands those November week ends, we'll predict the same for that popular activity. "Above 50 Mc." activity has a banner year also: more than 600 amateurs took part in the January V.H.F. Sweepstakes; a coast-to-coast relay on 144-Mc. was completed in June; and the 10,000-Mc. DX record was set and broken three times during the year — it now stands at 109 miles! "Burst" reception from meteor reflections was the means of several long-distance QSOs, and experimentation with this form of communication attracted considerable attention, not only among amateurs but also in professional fields.

At midyear a nationwide test of civil defense organization and facilities showed amateurs fully ready to perform their auxiliary communications functions. The Simulated Emergency Test in October continued to be another means of keeping amateur emergency skills at peak efficiency. RACES licensing continued to grow, with one-half of the States already having approved plans. Both civil defense and normal amateur emergency-preparedness organizations performed admirably in the East Coast hurricanes. The TVI specter was reduced to a skeleton, as more and more amateurs find the best way to lick the problem is to tackle it. The League's demonstration was given at a number of western cities, completing coverage of the country where low-band channels are in use.

Once again as we come to the close of a year we find that amateur radio can take pride in an outstanding performance, through the organized activities of its national association, and a meritorious record of performance "in the public interest, convenience and necessity."

## OUR COVER

This month's cover shows the interior of W3SMQ, Lansdowne, Pa. Equipment is completely homebuilt, following designs presented in *The Radio Amateur's Handbook*. In the rack at the left are the modulator and power supplies. On the desk is a push-pull 807 rig running 150 watts. To the right are the VFO and an 8-tube superhet. A Monitone is to the right of the receiver, and a *Handbook*-design antenna tuner on the window sill, upper left. Operator and constructor of W3SMQ is W. P. Hampton.

## A.R.R.L. QSL BUREAU

The function of the ARRL QSL Bureau system is to facilitate delivery to amateurs in the United States, its possessions, and Canada of those QSL cards which arrive from amateur stations in other parts of the world. Its operation is made possible by volunteer managers in each W, K and VE call area. All *you* have to do is send your QSL manager (see list below) a stamped self-addressed envelope about 4¼ by 9½ inches in size, with your name and address in the usual place on the front of the envelope and your call printed in capital letters in the upper left-hand corner. (Bold-face type indicates change since last QST listing.)

January, 1930

The editorial discusses the new 14,000-ke. 'phone band, pointing out its advantages as well as potential difficulties which can result from bad judgment and poor equipment.

A poor man's power transformer using hand-wound primary and filament coils and junk-box honeycomb coils for secondaries is described by E. H. Harrington, jr., W9CRR. Almost 900 volts each side of center tap can be furnished by the unit, which costs about four dollars.

Station of the month is W9BAG, owned by Frank Smolek of Chicago. The transmitter is a 50-watt crystal rig using Heising modulation on 'phone and buffer-filament keying on c.w. The receiver is a superhet, with a regenerative first detector, two i.f. stages, regenerative second detector, and audio. A two-inch cage suspended 45 feet in the air between two steel towers, with 70-foot aerial and counterpoise, serves as the radiator.

Results of the Board of Directors elections are made known. Alex Reid is the new Canadian General Manager; Prof. E. C. Woodruff returns as Atlantic Division Director; Dakota Division elects Cy. L. Barker; M. M. Hill represents the Delta Division; Louis R. Huber is Midwest Division Director; the Pacific Division chooses Allen H. Babcock; and Harry F. Dobbs becomes the Southeastern representative.

Trophies for the first Sweepstakes contest, a two-week period, are announced. Sweep brooms, three feet long, decorated in the League's black-and-gold, with radio tube handle-grips will be given to the top three men in the new contest.

This month's humorous story by "Felix," W5LS, entitled "Hams Are Born — Not Made," involves W. M. "Soupy" Groves, W5NW, and his "Brother-in-law."

A.c. receivers are discussed by Beverly Dudley, assistant technical editor. The author describes several circuits which were tried, and gives details of the final result, a completely-shielded receiver using a UV-224 r.f. stage, UV-224 regenerative detector, and a UV-227 audio amplifier.

# More About V.H.F. Auroral Propagation

## Recent Findings and Suggestions for Improved Results

BY ROLF DYCE,\* W2TTU

THE characteristics of propagation associated with the northern lights have been described in the pages of *QST* by Moore.<sup>1</sup> As v.h.f. communication equipment has improved, amateur use of auroral propagation has multiplied over the past few years, especially above 144 Mc. A program of amateur auroral reporting was initiated in 1951, some of the information gathered thereby appearing in "The World Above 50 Mc." These reports were then sent on to Cornell, where a statistical study has been attempted. Some results are presented here. Research in England,<sup>2</sup> Scandinavia,<sup>3,4</sup> Canada,<sup>5</sup> and Alaska<sup>6,7</sup> has progressed rapidly since 1950, yielding new ideas about auroral v.h.f. reflections which may be useful to the amateur for understanding the behavior of such propagation.

### Description of Auroral Signals

An aurorally-propagated signal has a characteristic growl or hiss due to a fast QSB that is at an audio rate up to several hundred cycles per

The b.f.o. will usually not give a clean note, so this is a sensitive test for signals propagated by aurora.

Unlike *E*- or *F*-layer propagation, strongest signals are usually obtained when both stations point their antennas northward, regardless of the actual great-circle bearing between stations. Often all stations will appear to come from the same direction in the north, as if a small portion of the aurora is responsible for all the propagation. During especially strong aurora, often accompanied by active overhead displays, the signals may appear to come from a variety of directions spread about north. However, in general, stations located to the east of the receiving station will have preferable directions eastward of magnetic north and likewise for westerly stations.

### Amateur Reports

Amateur reports of auroral propagation, collected with the help of ARRL and dating back to 1951, have been assembled at the Cornell

Fig. 1 — Useful working distances obtainable by auroral communication. Data taken from amateur reports.

second.<sup>8</sup> As the carrier frequency is increased from 50 to 144 Mc., the growl increases in pitch. 'Phone is badly garbled although relatively slow c.w. telegraphy can get through without difficulty.

Ionosphere Project. The individual stations were located on a map, and the direct airline distance was measured between pairs of stations reporting communication. This does not imply that the radio path was along this measuring line, but merely tells one at what distance communication was possible. Histograms showing the likelihood of occurrence of certain distances are given in Fig. 1. A similar graph for sporadic-*E* signals on 50 Mc. shows a prominent maximum at about 800 miles, with a "skip" region for shorter distances. However, notice in Fig. 1 how the probability of communication by auroral propagation falls off with distance. The graph below 100 miles is too low due to (1) blanketing strength of direct or tropospheric signal, (2) failure of amateurs to log familiar and nearby stations, (3) fewer amateurs because the inner ring contains less land area and hence fewer amateurs.

Fig. 2 — Communication is better along east-west directions. The airline distance between 144-Mc. stations working via aurora, expressed in two components, shows east-west distances far greater.

The 50-Mc. data suffer from the same errors, in addition to the fact that only one-tenth as many reports were sent in.

The information contained in Fig. 1 gives a measure of the distance over which auroral communication is to be expected. Such information would be difficult to obtain without the use of amateur reports. This graph also supports the view that auroral propagation is not a skip phenomenon, as was recently suggested in Norway.<sup>3</sup>

The 144-Mc. data were reexamined and the distance between each pair of stations expressed in two components—a north-south and an east-west distance. The results appear in Fig. 2. A difference in the two components is clearly seen, showing that east-west paths are generally longer than north-south paths. This effect may be due to the oblong shape of the population distribution, since most reports came from a narrow region extending from Ohio to Massachusetts. However, the preference for east-west station-to-station direction is also explained by a theory later to be discussed.

### An Auroral Signal Recorder

A scheme for automatically recording auroral signals has been assembled at the Cornell Ionosphere Project and has been operating almost continuously now for two years. Many amateurs are already familiar with the high-power transmissions continuously, day and night, from Cedar Rapids, Iowa, on 49.6 and 49.8 Mc.

Cornell University at Ithaca, New York, is located so that these transmissions come in strongly by auroral propagation, when it is present. It is possible to obtain a continuous record of auroral openings merely by attaching a recording milliammeter to the d.c. output from the detector. The QSB on an auroral signal is too fast for the recording pen to follow, so an average value is painted on the recording chart when auroral signals are present—see Fig. 3. Strong and frequent bursts of signal due to meteors can be obtained over the Cedar Rapids-to-Ithaca path. They provide an easy means of verifying that the transmitter is operating and for setting the receiver tuning. The occurrence of auroral signals as recorded in this manner correlates very well with such openings as reported by amateurs. Amateurs in general, and Michigan amateurs in particular, seem to have sharp ears because even brief occurrences of auroral propagation are caught at least by some. Of course, there are short periods when amateurs report auroral signals when Cedar Rapids has faded out. The reverse is also true. The recorder scheme provides a continuous check on the auroral signals throughout the entire night and is therefore useful for studying daily and seasonal variation in the frequency of occurrence of the auroral propagation. Records of auroral signals are a help in early warning of openings and in predicting subsequent openings.

A graph showing expectation of auroral propa-

Fig. 3 — Example of a short auroral opening beginning about 5:50 P.M. Esterline-Augus record of the 49.8-Mc. signal from Cedar Rapids shows need for checking v.h.f. bands in early evening hours. Blank spots on hour and half hour are 2-minute periods when transmitter is turned off automatically.

Fig. 4 — Good times for auroral propagation are 6:00 P.M. and 2:00 A.M.

#### Position in Space of the Ionization Involved

gation at any time of day appears in Fig. 4. Isolated cases of auroral signals have been observed at almost every hour, but the phenomenon is chiefly a nighttime one. This curve emphasizes the importance of observation just before supper-time. An interesting dip near midnight shows up, for which no explanation is here offered. It shows that openings frequently continue into the early morning hours, although they may die out temporarily around midnight. There are also cases of auroral openings after midnight not accompanied by auroral signals earlier.

Most of the organized research concerning auroral propagation has been done using radar. That is, by transmitting only for a brief instant (about 1/10,000 of a second) and measuring the time for this pulse to return to the receiver, one can determine the distance to the auroral ionization. Accompanied by a sharply directional antenna, the range and azimuth of auroral echoes can therefore be determined by a single station.

The seasonal variation was plotted in Fig. 5 by determining for each month the percentage of time that auroral propagation was present. Maxima of auroral propagation can be seen to occur in March and October, with important minima in December and June. A decrease can be seen from 1952 to 1954 that is believed to be authentic. This is attributed to the decrease in the sunspot activity over the past few years, expected to reach a minimum some time in 1954. With this information, one can better predict when auroral signals can be expected, or putting it another way — when no auroral propagation should be observed.

Some radar experiments were done at Cornell on 103 Mc., using a high-powered war-surplus search radar.<sup>9</sup> This used a large antenna 8 dipoles vertically and 4 dipoles in width, the whole affair being rotatable. Echoes were obtained about 400 to 600 miles to the north. There was fairly good correspondence between the echoes obtained and ray activity (vertical streaks) seen by eye. There never had been enough auroral activity to determine whether one could obtain echoes when aurora was overhead.

<sup>9</sup> Thayer, Master's thesis, Cornell University, 1952.

Fig. 5 — September and March are good months for auroral propagation. The decrease from year to year shown here should reverse after the 1954 sunspot minimum.

Fig. 6—Typical 50-Mc. auroral echo. The trailing edge of the 51.7-Mc. transmitter pulse is seen at the far left. Two auroral echoes can be seen delayed in time corresponding to 600-km. and 720-km. range.

During the summer of 1953, Ken Bowles (W2MTU, ex-ZGP) and the author had an opportunity to work at the Geophysical Institute at the University of Alaska. The Institute is located at College, Alaska, a few miles from Fairbanks. It is, therefore, only 100 miles to the south of the maximum auroral-activity zone which forms a ring around the earth's magnetic pole. Some observations will now be described that were performed by the author during 1953, and which are illustrative of recent research now under way at several locations. Aurora is seen frequently, is strong and occurs frequently over the entire sky including south of overhead. Hence, this northern latitude affords an excellent place to observe the effects of visible aurora on v.h.f. propagation.

Arrangements were made to operate a c.w. beacon transmitter on 51.9 Mc. about 100 miles to the east. The signal could usually be heard

weakly by troposphere propagation, but was heard when aurora was present coming from the north with the characteristic growing auroral QSB. On a different frequency assignment of 51.7 Mc., permission was obtained to install a transmitter five miles away sending pulses 150 times per second, each being about 100 microseconds in duration. The transmitting antenna was originally a horizontal dipole to send radiation in all directions in the meridian plane. A rotary 4-element Yagi was then used for receiving, using a low-noise crystal-controlled converter and a Super-Pro receiver. The d.c. detector output was fed into an oscilloscope, the strong direct signal coming from the transmitter being used to initiate each sweep. With the antenna pointing north during aurora and with the 51.9-Mc. station coming in by auroral propagation, weak echo pulses could be obtained, and the range easily estimated. (See Fig. 6.)

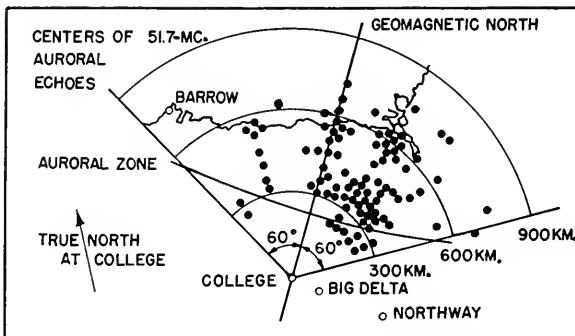

Fig. 7—Each point represents maximum auroral activity at a different time. Azimuth determinations were usually made using a c.w. transmitter equipped with a turnstile omnidirectional antenna, with a directive array on the receiver. A hill impeded observations to the northwest.

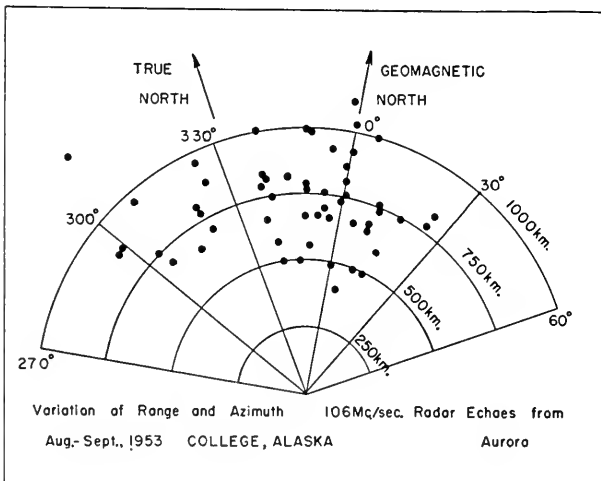

Fig. 8—Results using high-powered search radar on 106 Mc. (Courtesy of K. Bowles)

Fig. 9 — Auroral radar echoes do not occur at short distances.

It has been shown by parallax photography that most visible auroral light comes from about the *E* region at a height of about 60 miles, or 100 kilometers.<sup>10</sup> One would, therefore, expect to encounter echoes as close—but no closer—than about 100 km., and also to find echoes from the south when visible auroral forms could be seen there. This was quickly seen to be not the true state of affairs. Echoes were obtained mainly from distances greater than about 400 kilometers and were never obtained from the south. Contrary to expectations, most echoes came from places far to the north of the auroral zone as shown in Figs. 7 and 8. The echoes clearly came mainly from the northern quadrant. Some continuous film records of echo range were made at 51.7 Mc. They gave the statistical result shown in Fig. 9, showing a pronounced tendency for the echoes to have ranges of 500 km. or greater.

To rule out the possibility that these echoes might be coming from overhead ionization at a height of 500 km., an antenna with a vertical main lobe was constructed for comparison purposes. Six half-wave elements in a broadside array were suspended above the flat metallic roof of the Geophysical building. A separate

converter, receiver, and oscilloscope were connected, so that the observer could watch both antenna presentations simultaneously. Echoes from meteors were seen with both antennas, indicating that both sets of receivers were working properly. Next, observations of auroral echo range were made when overhead arcs, bands, rays, and corona were present. These occur frequently at College. All auroral echoes were definitely much stronger on the rotary Yagi antenna which was looking at low angles. Similar results were found with the 106-Mc. radar equipment by tilting the regular antenna to point overhead during overhead aurora. These experiments show that auroral echoes are (1) from targets at great distances, probably at a height of about 100 kilometers, and (2) from low angles of elevation, no matter where in the sky the visible auroral forms occur.

At College, one frequently sees streaks of auroral light rising from the western horizon, extending overhead and down to the eastern horizon. It has already been shown that the v.h.f. echoes were not coming from the overhead

(Continued on page 116)

<sup>10</sup> Stormer, *Terrestrial Magnetism and Atmospheric Electricity*, 51, December, pp. 501-504 (1946).

Fig. 10 — For v.h.f. propagation, the bounce-point needs to be roughly perpendicular to the field of the earth's magnetic force, even if auroral ionization existed over the entire sky. In this exaggerated picture, beams A and B give echoes, but C, D, and E do not.

# Bandswitching a Crystal-Controlled Mobile Converter

*Using the B.C. Receiver as a Tunable I.F. for 3.5-30-Mc. Reception*

BY C. VERNON CHAMBERS, W1JEQ

ALTHOUGH the converter shown in the photographs was designed primarily for mobile use, this relatively simple unit will add gain and stability to almost any of the less-expensive communications receivers that include the broadcast range. While one might conclude from its compactness that it is rather difficult to construct, carefully planned subassemblies make the job comparatively easy. In a mobile installation, the unit can be suspended directly under the car broadcast receiver, where it is hardly noticeable and detracts nothing from the appearance of the instrument panel, nor from the comfort of front-seat passengers.

The high-frequency oscillator in a crystal-controlled converter is fixed in frequency, of course. Therefore, this system departs from the more conventional in that the b.c. receiver, rather than the converter, is used to tune over the ham bands. The frequency stability gained by the use of crystal control is hard to appreciate until you have tried it. Over rough roads, at any speed, even 10-meter signals stay put. Only a jolt hard enough to detune the broadcast receiver will change the frequency.

Another advantage that is sometimes overlooked is the fact that most car receivers (and all communications receivers) have good dials that are easy to handle and conveniently located. This is in contrast to the miniature controls

found on most tunable mobile converters as a result of the effort to keep within minimum dimensions. Even the smallest tunable unit requires space that is difficult to find in a convenient spot without interfering with panel instruments or leg room.

While the converter draws 20 ma. at 150 volts, tests have shown that the performance is essentially unchanged with the plate input reduced to 5 ma. at 45 volts. This means, of course, that the unit can be supplied from the car-receiver power pack with no danger whatever of overloading it. Or, if you are reluctant to dig into the receiver to bring a B+ lead out, you can operate the converter from a small B battery.

## The Circuit

The circuit diagram is shown in Fig. 1. A 6AK5 is used as an r.f. amplifier, and a 6J6 dual triode as the frequency converter. Since the tuning of the converter is fixed, the circuits of the r.f. amplifier must be broadbanded to pass all frequencies in any ham band. These circuits consist of slug-cored coils tuned by the tube capacitances. However, a trimmer capacitor,  $C_3$  in Fig. 1, is included so that the amplifier grid circuit can be peaked up for the particular antenna in use, or in going from one end of the band to the other.

A common trouble experienced when a broad-

The input tuning capacitor ( $C_3$ ), the bandswitch, and  $S_1$  are in line from left to right on the front wall of the chassis. The tuning slugs for the coils may be adjusted through holes drilled in the sides of the chassis. Inside the unit, switch sections  $S_{2A}$  through  $S_{2F}$  are in line in that order from front to rear. Crystals for the oscillator are grouped between switch sections  $S_{2D}$  and  $S_{2E}$ .

**QST** for

cast receiver is used as a tunable i.f. is that strong local broadcast signals may feed in through the converter to reach the b.c. receiver input and cause interference. This effect has been minimized in this design by providing a pair of wave-traps,  $C_1L_1$  and  $C_2L_2$ , at the input. With  $C_1L_1$  tuned to the strongest signal at the low-frequency end of the b.c. band, and  $C_2L_2$  tuned to the strongest local signal at the high end of the band, the feed-through of b.c. signals will seldom be bothersome.

For frequencies above 7 Mc., the oscillator section of the converter works at harmonics of the crystal frequency. At these frequencies a circuit is used which limits the oscillator output essentially to the desired harmonic frequency. On 3.5 and 7 Mc., the crystals work at the fundamental, and the circuit is a simple Pierce,  $L_6$  being eliminated on these bands.

For the sake of simplicity in the diagram, only a single set of coils (the 14-Mc. set) is shown. Other coils and crystals are wired similarly to their respective switch points. Switch section  $S_{2E}$  is not used as an active switch, its point terminals merely serving as a most convenient tie-point strip for supporting the junction of the crystals and  $L_6$  coils. In the case of the 7- and 3.5-Mc. positions, where no  $L_6$  coils are used, the corresponding switch points are simply wired together, as indicated.

$S_1$  performs the switching necessary in shifting from ham-band to broadcast input.  $S_{1A}$  and  $S_{1B}$  shift the antenna from the converter to the b.c. receiver, while  $S_{1C}$  turns off the converter filaments.

As with a conventional superhet, the frequency of the crystal-controlled oscillator must differ from the frequency of the incoming signal by the frequency of the i.f. amplifier. In this case, the i.f. will vary from about 550 to 1550 kc. — the usual tuning range of the b.c. receiver. An ac-

• Here is a mobile converter that includes bandswitching and crystal control — features that add much to the operating convenience and received-signal stability. The standard car b.c. receiver is used as a tunable i.f., eliminating the problem of providing suitable controls and space often involved with tunable converters. Form factor has also received careful consideration. Plate power requirements are easily handled by the car-receiver supply, or even a small B battery, if the operator wants to avoid tampering with the b.c. receiver.

companying table shows the crystal frequency, the h.f. oscillator frequency, and the range over which the b.c. receiver must be tuned to cover each of the ham bands. The oscillator works on the low-frequency side of the signal frequency in this instance.

Since the range of the b.c. receiver is approximately 1000 kc. (1550–550 kc.), the tuning range with any single crystal is limited to 1 Mc. However, this is more than adequate for all except the 10-meter band. For full coverage of this band, two crystals are used, as indicated in the table. The two frequency ranges are from 28 to 28.9 Mc., and from 28.75 to 29.7 Mc. The 11-meter band is not normally included, but values are given so that this band may be substituted for one of the 10-meter ranges if desired.

### Construction

The converter is built into a  $2 \times 7 \times 7$ -inch aluminum chassis. The top cover (actually a bottom plate for the chassis, and not shown in the photographs) is a flat piece of aluminum measuring 7 by 9 inches. The extra inch of overlap on each side provides lips for fastening the

Connectors  $J_1$ ,  $J_3$  and  $J_2$  are mounted in that order, from right to left, on the rear wall of the converter. One-inch holes in the side wall permit the removal of tubes. The  $\frac{5}{16}$ -inch holes are for adjustment of the 28-Mc. coils.

converter to the bottom cover of the b.c. receiver by means of machine screws and metal spacers.

The aluminum bracket for the large subassembly should be made first. This subassembly is shown to the left of the bandswitch in the front view of the converter, and in the two detail photographs. The bracket is  $5\frac{1}{2}$  inches long and  $1\frac{7}{8}$  inches high, with  $\frac{3}{8}$ -inch lips bent along the bottom and the rear end. The detail photographs identify the components in this subassembly, indicating the holes that must be drilled for the tubes, coils and r.f. chokes.

When the bracket has been drilled, place it against the rear wall of the chassis, and  $\frac{3}{4}$  inch in from the left side, and mark the mounting holes in the chassis. Then slide the bracket against the left-hand side of the chassis and spot the slug-adjusting holes, and the 1-inch holes that permit removal of the tubes. The latter are the ones covered with snap-in buttons in the rear view.

The tube sockets are mounted on a piece of aluminum  $3\frac{3}{4}$  inches long overall, and  $1\frac{7}{8}$

not project and make contact with the band-switch terminals later. At the conclusion of the wiring of the subassembly, connect power leads that will run to  $S_{1C}$  and  $J_3$ , and attach a 2-inch length of wire to Pin 5 of the 6J6. The free end of the latter will later be connected to  $S_{2D}$ .

The remaining slug-tuned coils are mounted as a second subassembly on a bracket the same in size as the first, although the mounting lips must be bent in the opposite direction. The coils are arranged in three groups of four coils. The coils are centered at the corners of a  $\frac{3}{4}$ -inch square. The first square is centered on the strip and at  $\frac{5}{8}$  inch from the front edge of the strip. The second square is centered  $2\frac{1}{2}$  inches from the front edge, and the last square is centered  $3\frac{5}{8}$  inches back. At the center of each of the two squares toward the front a hole is drilled for a 1-inch 6-32 screw. A soldering lug and a  $\frac{3}{4}$ -inch metal spacer are slid over the screw before it is fastened to the bracket. The lugs are convenient grounding terminals.

Before the coils are mounted, this bracket

RFC<sub>2</sub> — 10-mh. r.f. choke (National R-100S).

inches wide. This piece is spaced  $1\frac{3}{8}$  inches from the bracket and is supported from it at the four corners by long 6-32 screws with metal spacers. It has  $\frac{3}{4}$ -inch holes opposite the two inside coil forms, and  $\frac{5}{8}$ -inch holes to clear the two r.f. chokes.

Before assembling the unit, the antenna coils ( $L_3$ ) should be wound on each of the two  $L_4$  forms. Each of the North Hills coil forms has an extra set of terminals that may be used as tie points for the switch ends of the  $L_3$  windings. (By judicious use of these extra terminals, it is possible to complete the wiring of the converter without employing any additional tie points.)

Small components should be kept close to the tube-socket supporting strip so that they will

meter oscillator coil to the right. The antenna coils,  $L_3$ , should be wound on their corresponding grid-coil forms ( $L_4$ ) before assembling.

Only a single by-pass condenser is shown in the diagram at  $C_6$ . Actually, there are three of them. One is at the junction of the cold ends of the two 10-meter coils, one for the 3.5- and 7-Mc. coils, and one for the 14- and 21-Mc. coils.

### The Bandswitch

The bandswitch is made up from Centralab Switchkit parts as indicated under Fig. 1. The wafers are spaced as follows: index head to wafer  $S_{2A}$ — $\frac{5}{16}$  inch,  $S_{2A}$  to  $S_{2B}$ — $1\frac{1}{16}$  inch,  $S_{2B}$  to  $S_{2C}$ — $1\frac{7}{16}$  inches,  $S_{2C}$  to  $S_{2D}$ — $1\frac{1}{16}$  inch,  $S_{2D}$  to  $S_{2E}$ —1 inch,  $S_{2E}$  to  $S_{2F}$ — $1\frac{3}{16}$  inch. The tail of the bandswitch shaft should be cut off close to the last wafer, to leave space for  $J_3$ , but the two assembly screws should be allowed to extend through the rear wall of the chassis to strengthen the support. In assembling the switch, be sure to use the small fiber washers between each ceramic spacer and between the wafers and the spacers to prevent cracking of the ceramic. All wafers should be placed on the assembly rods so that the rotor or "arm" terminal is the second terminal to the left of the upper assembly rod, as viewed from the front.

The crystals can be soldered to the switch contacts after the switch is mounted in the chassis. They are placed between  $S_{2D}$  and  $S_{2E}$ . In the rear-view photograph, the crystals, left to right, are for 3.5 Mc., 7 Mc., 21 Mc., and the high end of the 28-Mc. band. The crystals for the 14-Mc. band and the low end of the 10-meter band are placed horizontally, one above the other, against the bottom of the chassis. They are hidden by the group of three lower-frequency crystals. Prongs taken from an octal socket and slid over the crystal-holder pins are a good means of connecting the crystals to the switch wafers.

The three controls are lined up along the center line of the front edge of the chassis, with the antenna trimmer,  $C_3$ , to the left, the bandswitch at the center, and  $S_1$  at the right. The two outer controls are centered 2 inches from the band-

switch shaft. In the final assembly these should be mounted first.

Shielded phono jacks (RCA type) are used for  $J_1$  and  $J_2$ , and are placed near the two rear corners of the chassis. In the rear view, the antenna jack is at the right and the output jack at the left. The fiber mountings of these jacks will need to be clipped off so that they will fit between the chassis and the subassembly brackets. These should be mounted next, and the coax leads run to  $S_{1A}$  and  $S_{1B}$ , keeping the leads along the bottom corners of the chassis.

Next the two subassemblies can be mounted and connections made to the bandswitch. Most of these connections can be made most easily with bare No. 16 wire. In addition to the connections shown in the diagram, the bandswitch terminals immediately to the left of the upper tie rod (as viewed from the front) on  $S_{2A}$  and  $S_{2B}$  should be connected together, and then to the ground terminal at the socket of the 6AK5. This grounds the inactive  $L_3$  and  $L_4$  coils.

As a last operation, the power leads are brought to the power supply connector,  $J_3$ , and soldered to the terminals.

### Power Supply

The converter requires 0.625 ampere at 6 volts for the heaters, and anything between 5 ma. at 45 volts to 20 ma. at 150 volts for the plate supply. This can be taken most conveniently from the car b.e. receiver by connecting two leads to an audio-output-stage socket. It is preferable to take the filament voltage from this point, rather than from the car wiring, so that advantage may be taken of any battery-line filtering that may be built into the b.e. receiver. Plate voltage should be taken from the screen terminal. This voltage will usually be about 200, and can be dropped down to the desired value with a series resistor. A 12,000-ohm 2-watt resistor will usually be about right. This resistor should drop the voltage from 200 to approximately 75 at about 10 ma. The hot filament and plate-supply leads, plus a

ground lead, can be brought to a connector mounted on the b.c. receiver, or run in the form of a cable terminated with a female plug that fits the connector at the rear of the converter. Shielded wire should be used for the cable.

### Antenna Coupling

With a small antenna, such as a mobile whip, tight coupling to the antenna is essential for best signal response. It is also important in avoiding regeneration in the r.f.-amplifier stage. Therefore, especially when the antenna is a small one, it should be resonant. This is usually the case in a mobile installation where the antenna must be made resonant for transmitting. If a signal generator is used for preliminary adjustment, it should be one having low-impedance (about 50-ohm) output. Here at the ARRL lab, initial tests were made with a signal generator. Final tests were made with a standard 10-meter whip loaded with a Johnson "Whipload-6," preadjusted to each

band. The bandswitching feature of this loading unit was most convenient in changing back and forth between bands along with the converter.

### Adjustment

The high-frequency oscillator should be checked first, listening on a communications receiver at the oscillator frequencies listed in the table. No adjustment of the oscillator is necessary at 3.5 and 7 Mc., but at the higher frequencies the slugs of the  $L_6$  coils must be adjusted for most stable output at the proper harmonic frequencies. Set the receiver to the desired frequency and adjust the slug until the oscillator signal is heard. To make sure that the oscillator is crystal-controlled, jar the converter. If the signal is crystal-controlled, no amount of jarring should change the frequency. If it is not crystal-controlled, the slug should be adjusted carefully until the oscillator locks in with the crystal.

(Continued on page 120)

This assembly supports the tubes, the 28-Mc. coils, and most of the small components of the crystal-controlled converter. The support plate for the tube sockets has rounded ends to clear coils  $L_4$  and  $L_6$ , and a pair of  $\frac{3}{4}$ -inch holes to provide access to the terminals of the amplifier plate coils. The wire leads leaving the unit at the left connect to  $S_{1B}$ ,  $S_{1C}$ , and Pin 3 of  $J_3$ , as shown by Fig. 1.

# A Cubical Quad for 20 Meters

## Reviving a Neglected Type of Beam

BY S. B. LESLIE, JR.,\* W5DQV

• The cubical quad enjoyed brief popularity when "10" was in its glory, but has practically disappeared along with sunspots and ten-meter activity. The author finds it highly satisfactory on 14 Mc. and offers reasons why it is worth serious consideration if you're thinking of putting up a beam.

**I**N pursuit of our hobby we occasionally run across a piece of equipment that performs in a satisfactory manner, is easy to build, simple to adjust and low in cost, yet for some unknown reason is neglected and forgotten by the majority of amateurs. Such is the case of the cubical quad antenna. A few years ago, when 10 meters was open, the quad enjoyed considerable popularity. Many amateurs reported that it gave them results equal to, and in many cases superior to, the conventional 3-element Yagi, some claiming gains as high as 10 to 11 db.<sup>1, 2</sup> Measurements at ARRL headquarters gave the quad a gain of 7 to 8 db. over a reference dipole antenna, a gain equal to that of a good three-element beam.<sup>3</sup>

As 10 meters faded out so did the quad; the fellows who had been so enthusiastic about it failed to carry through and use it on the lower frequencies. Comments received over the air now indicate that many hams do not know what the quad is or what it is capable of doing. Those who are familiar with it seem surprised that a practical one for 20 meters could be built and all assume it would be a monstrous affair. Actually, the quad occupies less space and appears smaller than a three-element beam.

The cubical quad consists of a radiating element and a parasitic reflector, usually spaced 0.15 or 0.20 wavelength, both radiator and reflector consisting of square loops one quarter wavelength on a side, making a total of one wavelength around the loop. This configuration can be arranged either as shown in Fig. 1A or Fig. 1B, that shown at 1B giving slightly higher gain.<sup>3</sup> In some installations the reflector is made

a little longer than the radiator as in Yagi beam construction, in others it is made the same length as the radiator. In either case, provision is made for tuning the reflector by means of a shorted stub or variable condenser in order to obtain optimum phasing. These square loops may be thought of as two half-wave elements stacked one quarter wavelength apart with their ends bent to connect them together, hence a lower angle of radiation is obtained than would be expected from a simple two-element beam. Many of the early versions used two-turn loops for radiator and reflector but this served no purpose except to raise the feed-point impedance.<sup>3</sup>

### Performance Data

The amateur literature has very little to say regarding the mode of action of the quad and anyone interested is urged to read the articles mentioned above. Since this antenna seemed to have several advantages over the Yagi and as very little experimental work had been reported on it, a scale model for the 50-Mc. band was built to try to determine some of its characteristics. All measurements were made with the center of the array one wavelength above ground and the instruments used were a Heathkit AM-1 antenna impedance meter, a Millen grid-dip oscillator and a homemade field-strength meter. The test signal was furnished by a transmitter feeding into a dipole elevated one wavelength above the ground and located three wavelengths from the antenna being tested. All measurements were

W5DQV adjusting the phasing stub on his 20-meter quad. The main supports are bamboo fishing poles.

double-checked on two different occasions to make them as accurate as the instruments would permit.<sup>4</sup> The results are tabulated below:

Radiator alone	Imp.	110 ohms
	Gain over dipole	2 db.
Reflector spaced 0.20	Imp. of radiator	75 ohms
	Gain over dipole	10 db.
Reflector spaced 0.15	Imp. of radiator	65 ohms
	Gain over dipole	8 db.
Reflector spaced 0.10	Imp. of radiator	45 ohms
	Gain over dipole	8 db.
Director spaced 0.20	Imp. of radiator	50 ohms
	Gain over dipole	5 db.

The gain figures seem high but they are the actual readings obtained. The radiating element alone, without reflector or director, gave a consistent gain of 2 db. over a well-matched and

and reflector. Such a beam might prove considerably better than a three- or four-element Yagi. Time limitations prevented investigating these possibilities, but it is hoped that the above experimental work will stimulate more work on the quad by other amateurs. This beam is worth much more attention than it has received in the past.

The 20-meter quad here at W5DQV has created considerable interest, nearly half the stations contacted asking for more information about its operation and construction. After fourteen months' operation on 20 c.w., this antenna has proven its worth as it has given results equal to and often superior to the three-element wide-spaced beam it replaced. It is definitely smaller than the usual three-element beam, having a

Fig. 1 — Two different arrangements of cubical quad antennas.

trimmed dipole. This does not agree with the published figures for a square loop; nevertheless, this 2-db. gain was obtained on two different occasions, using different loops and different dipoles, all grid-dipped to the correct length. Disregarding this 2-db. gain of the square loop, the 0.20 spaced quad still gives a gain of 8 db., a very respectable gain indeed.

A field pattern taken with the reflector at 0.15 is shown in Fig. 2. A pattern taken at 0.20 showed a similar outline but with somewhat greater attenuation of the back lobe.

The radiation from the sides of these test beams and the one used on 20 meters was remarkably low, the field-strength meter indicating almost zero off the sides. On-the-air tests with the 20-meter quad showed a 45-db. front-to-side ratio and 25-db. front-to-back ratio. A square element tuned as a director and spaced 0.20 wavelength gave a gain of 5 db. over the dipole, which brings up the interesting possibility of a three-element quad using 0.15 or 0.20 spacing for both director

"wing span" of only 16 feet 9 inches as compared to 33 feet, a boom length of only 12 feet as compared to 20 or 24 feet, and as described here, a weight of about 20 pounds. Yet this is a full-sized beam capable of giving full-sized performance; there are no shortened elements and there are no loading coils to absorb power. It is easily turned by a TV rotator, is constructed of readily obtained materials, and can be built, put in place and tuned in one or two week ends.

### Construction

Most of the details of construction can be seen in the photo and drawings. It was built to be as light as possible and while it does whip some in the wind, this does not seem to cause any notice-

Fig. 2 — Field-strength pattern of 50-Mc. cubical quad with 0.15 spacing. The broad nose and sharp dips off the sides are also very noticeable in on-the-air tests with the 20-meter quad.

<sup>4</sup> Antenna measurements of any type tend to be tricky, even with elaborate and accurately-calibrated equipment, because of the difficulty of detecting and eliminating stray effects which sometimes are of the same order of magnitude as the quantities under investigation. Results such as those tabulated here (and other similar tabulations of antenna performance figures) are of considerable value, practically, if it is kept in mind that they are necessarily approximations, useful as a guide but not to be taken as literally as, say, the reading of a good quality d.c. voltmeter. — Ed.

Fig. 3 — End and side views of 20-meter quad. Upper insert shows method of fastening antenna wire to support arms. Center insert shows construction of support-arm mounting bracket. Lower insert shows method of attaching feed line and stub to the center insulators. Two small egg insulators are used, fastened to end of lower boom as shown with a small nail.

able change in loading or on received signals. There is nothing critical in the construction except the length of the wire elements, and no doubt many will devise better ways to build and support this antenna. One of the quads built by a local ham used 1 × 2-inch pine for the support arms but this beam was much too heavy and blew down in the first light wind. The support arms shown in the drawing are ordinary bamboo fishing poles about 16 feet long, with the butt ends wrapped with friction tape to prevent the metal mounting bracket and wire from biting into the bamboo. These arms are fastened to the mounting brackets as shown in Fig. 3 with several turns of No. 14 galvanized wire, and the far ends are not trimmed until the antenna wire has been fastened in place. Two mounting brackets and eight bamboo support arms are required. The mounting brackets serve to hold the arms in place and to fasten them to the end of the boom. These brackets are made by welding two 24-inch lengths of 1-inch angle iron together back to back to form a large "X" 90 degrees between legs, and welding a 5-inch length of 1½-inch strap iron between two of the legs to fasten the "X" to the boom end. The arms are assembled and the antenna wire is fastened in place before attaching the brackets to the boom.

Many amateurs will raise their eyebrows at the idea of using fishing poles in construction of an antenna, but if the poles are well treated with a weatherproofing compound they will last several years. Weatherproofing compounds are available at all lumber dealers. This antenna has been up for over a year in all sorts of weather and as yet shows no signs of wear. Be sure to get straight poles with no splits in them. No insulators are

necessary, the poles themselves acting as long insulators. The antenna shown in the photo uses plastic insulators but subsequent beams have shown these to be unnecessary. The easiest way to mount the antenna wire on the arms is to lay a long length of wire on the ground and mark it at quarter-wave intervals, in this case 16 feet 9 inches, and use these marks to indicate where the wire fastens to the pole. Fasten loosely at first as it will be necessary to slide these joints up and down the poles a little until all four sides of the

# A Discussion of Receiver Performance

## *Some Fine Points and Unsolved Problems of Receiver Design*

BY E. W. PAPPENFUS,\* W0SYF

• Here is an article on receivers that anyone with the slightest interest in "why" should not pass up. It won't tell you how to build anything, unless you read carefully between the lines, but it will certainly help you to understand some effects that may have been a mystery up to now.

SINCE good communication superheterodyne receivers have been available for about twenty years, it is surprising that there is anything left to discuss about this line of equipment. However, the large number of letters that are written to the manufacturers questioning receiver performance points to the need for a discussion of the action of a receiver under certain conditions. These include weak-signal reception as well as performance in the presence of a very good signal. Many hams feel that there is no need to miss a QSO because a signal is weak. They feel that if a signal can't be read, it is strictly the fault of the set design. At the same time, it is hard for many radio operators to understand why a receiver cross-modulates and blocks when the kilowatt station next door comes on the air. As you may guess, this is a discussion of the reasons why a receiver is not all the amateur expects and perhaps also a defense of receiver design.

The subjects to be discussed include receiver sensitivity, signal-to-noise ratio, noise figure, cross-modulation and blocking. It is self-evident that a receiver for amateur use, and particularly for DX, must have a great deal of inherent amplification. The ability of a receiver to make a lot of sound in the loudspeaker with a very weak signal is called "sensitivity." High sensitivity in a receiver is a necessary, but not sufficient, definition of weak-signal receiver performance. "Signal-to-noise ratio" is also very important.

It is not quite as apparent that a good communications receiver must be free from overloading or cross-modulation when strong signals are present. These undesirable effects are generally overlooked in the general confusion and congestion of the present-day amateur bands. It must be admitted that the modulation splatter blamed on the local amateur at the other end of the band is sometimes generated in the receiver. It is unfortunate that a receiver designed for very good weak-signal performance should have difficulty with extremely strong signals. This, however, is the case, and it is an area in which

an engineering compromise must be reached. Like most compromises, it is open to argument, and there is no completely clinching evidence to prove that the receiver design was right. The compromise involves r.f. stage gain, a.v.c. characteristics, r.f. selectivity, type of r.f. tubes, type of mixer tube, and mixer noise. With all of these balancing factors it may be seen that it is not an easy decision for the set designer.

The signal-level chart for a 75A-3, shown in Fig. 1, will help to explain some of the items discussed previously. In developing this chart, a signal generator was set for a convenient level at the antenna and then moved back, stage by stage, toward the diode detector. The signal generator output was adjusted to hold constant diode-load voltage at each point in the circuit and, of course, the frequency was changed appropriately at the i.f. amplifier. The signal generator was then returned to the antenna terminals and increased to simulate a stronger signal. Again the signal generator was moved toward the second detector holding diode-load voltage constant. Moving the signal generator along, stage by stage, is equivalent to a voltage measurement at that point. A family of curves was generated, as shown, that gives a complete picture of receiver performance with various r.f. input levels. A change in gain is represented by a change in slope of the curve. Note the constant gain of antenna link to first r.f. grid, and the reduction in gain due to a.v.c. in the first r.f. stage and the i.f. amplifiers. It is clear how the gain of the five controlled stages changes to hold the diode-load voltage almost constant.

### **A. V. C.**

The basic function of automatic volume control in a receiver is to keep the diode-load voltage constant and thus hold constant audio output for changing signal levels. This is apparent from Fig. 1, because the diode-load voltage does not rise appreciably above 8 volts as the signal level is changed from 1.5 to 100,000 microvolts. This constancy of receiver output voltage does not tell the whole story, however. It is important to "delay" the application of a.v.c. voltage until a suitable signal-to-noise ratio is reached. This allows the receiver output to increase in a linear manner with input signal level so that receiver noise is rapidly overcome. In the 75A-3 the a.v.c. does not become effective until the input signal is about 1.5 microvolts. In addition, some sets delay the application of a.v.c. voltage to the r.f. stage until even higher signal levels are reached. This also contributes to a linear improvement in signal-to-noise ratio as the input signal is

\*% Collins Radio Company, Cedar Rapids, Iowa.

increased above the a.v.c. threshold. As an example of delayed a.v.c. action, if a 2-microvolt signal gives a 10-db. signal-to-noise ratio, then a 20-db. increase to 20 microvolts will give a 30-db. signal-to-noise ratio. A 10-db. signal-to-noise ratio provides a good readable signal, but a signal with less noise is more enjoyable and less tiring to the operator.

By dividing the a.v.c. voltage applied to the r.f. stage in the 75A-3, suitable action is obtained without separately delaying the r.f. stage a.v.c. voltage. Since a sharp-cut-off tube is used in the 75A-3 r.f. stage, there is a secondary reason to limit a.v.c. voltage to this tube. A 6BA6 is a better tube for a.v.c. action, but unfortunately it is a very noisy tube compared with the 6CB6 that is used.

Manual gain control in the 75A-3 operates on the a.v.c. line, just as the automatic volume control does. This means that the gain distribution is proper for any reasonable setting of the manual gain control. It is possible to degrade the signal-to-noise ratio with manual gain control if too much gain-adjusting action is applied to the r.f. stage, so that mixer noise is proportionally larger. Noise tests on a receiver should be made at various signal levels to insure that manual gain control is applied to the proper stages.

### Weak Signals

It is possible to put a large amount of over-all amplification in a receiver because the amplification at a given frequency can be held to a manageable level through the use of the superheterodyne principle in single- or multiple-conversion (75A) schemes. The gain from antenna to loudspeaker in a typical communications receiver may be as great as 10 million, but all this gain does not permit the amateur to copy a weak DX station unless the noise contributed by the antenna-coupling circuit, the first r.f. tube shot noise, mixer noise, etc., is held to a low value. That is the reason receiver performance is specified by *signal-plus-noise-to-noise ratio*. A signal generator modulated 30 per cent at 400 c.p.s. (to simulate a speech signal) is fed into the receiver antenna terminal. The proper resistor is placed in series to match the receiver input impedance. The signal generator output is increased until there is a 10-db. increase in the reading of an output meter connected to the receiver audio over

the level present when the modulation is switched off. This means that the signal (modulated portion) plus noise is 10 db. stronger than the noise. A signal 10 db. stronger than the noise level is acceptable for voice communications, hence the justification for this value. A good c.w. operator can copy signals with a lower signal-to-noise ratio, but the lower the signal-to-noise ratio, the more expert the operator must be.

It is dangerous to generalize, but it is possibly safe to say that any amateur receiver with a 10-db. signal-to-noise ratio at from 1 to 3  $\mu\text{v.}$  is in the high quality class. Noise-figure tests<sup>1</sup> of receiver performance make use of a noise diode and are the only real means of comparison between receivers of different bandwidth, because receiver noise voltage varies proportionally to the square root of the bandwidth. A narrow-band receiver should not be compared directly with a wide-band set. Noise figure expresses the ratio in db. between the noise level of the receiver under test to a so-called perfect receiver in which all noise is assumed to be generated in the dummy antenna due to its thermal noise. (See Appendix.)

It can be shown that a perfect receiver with 6-kc. bandwidth and 100-ohm input would require 1.4  $\mu\text{v.}$  to have a 10-db. signal-plus-noise-to-noise ratio. This receiver when operated with a dummy antenna matching the receiver input impedance has a 3-db. noise figure. It is theoretically possible to improve the noise figure by mismatching the antenna, but this is not important from a practical standpoint in the ham bands from 10 to 160 meters, because the antenna impedance cannot be predicted accurately. Again a compromise in design results, and a 100-ohm input impedance was selected for

<sup>1</sup> Goodman, "How Sensitive Is Your Receiver?" *QST*, Sept., 1947.

Fig. 1—A signal-level chart of the 75A-3 receiver, showing the signal levels that exist through the receiver for various input signals and bias voltages.

the 75A-3. Since signal generators are generally available and noise diodes are not, it is customary to use the signal generator method with 10-db. signal-plus-noise-to-noise as the standard of comparison between receivers. Incidental frequency modulation in the signal generator can cause errors particularly at high frequencies and should be guarded against.

Noise in a receiver results from so-called thermal-agitation noise in the input circuit, shot noise, mixer noise and amplifier noise. Pentagrid mixers are particularly noisy tubes, but they are advantageous because of the ease with which the oscillator can be fed into the mixer and the freedom from coupling of oscillator voltage to the signal grid.

If enough gain-producing elements precede the mixers, then the mixer noise can be neglected. Since the greatest gain exists from the grid circuit of the first r.f. amplifier to the receiver output, it is logical to expect this noise to be louder than any other receiver noise. This is not always true, but in a properly designed receiver the input noise makes the greatest contribution to over-all receiver noise. This can be demonstrated by peaking the grid circuit, with

Fig. 2 — The cross-modulation effects in a receiver can be measured by using two signal generators connected as shown here.

a resistor of proper value across the antenna terminals. A rise in receiver noise output when the first r.f. tank circuit is tuned compared with the completely detuned condition indicates the proper gain distribution. A drop in noise level as the first r.f. tube is removed also shows that the mixer noise is not an important factor in over-all receiver signal-to-noise ratio. Two r.f. stages are generally not required to approach the ideal weak-signal receiver performance, because a single stage using a high-transconductance tube will amplify the signal sufficiently to override the mixer noise. The chart of Fig. 1 shows the equivalent noise present at the mixers. The gain here appears sufficient to override completely the mixer noise with 1.5- $\mu$ v. input.

If this peaking effect of noise with antenna terminals properly loaded with a resistor is not found, then the antenna coil gain, antenna circuit  $Q$  or r.f. amplifier gain should be adjusted until the receiver noise is dominated by the receiver input noise. Only then can the operator say that his receiver is able to hear the weakest stations. This actually is a rather theoretical consideration because of the large amount of static and interference prevalent, except perhaps

on the 10-meter band. When the weakest reading on the S-meter across the entire 20-meter 'phone band is S6 to S9, because of a solid array of strong signals, obviously receiver noise is not then the limiting factor. Receiver bandwidth is much more important. Atmospheric and manmade static on the antenna also limit the signals that can be copied. Only rarely can the full signal-to-noise capabilities of a receiver be used. This can be checked by tuning to an unused portion of the band (that's a joke, son) and then removing the antenna from the receiver and replacing it with the equivalent resistance. If the receiver noise output drops, then the antenna noise is the limiting factor and not the noise developed within the receiver.

### Strong Signals

For the reception of strong signals, an additional receiver requirement is added. Radio-frequency voltages applied to any stage of the receiver must not exceed the bias for that stage with any signal ordinarily encountered. Fortunately, the receiver a.v.c. voltage increases the bias applied to each stage and at the same time reduces the gains through the receiver when strong signals are tuned in.

Five controlled stages are used in the 75A-3 a.v.c. circuit. By removing one controlled stage or by reducing the proportion of a.v.c. voltage fed to a stage, it is possible to change the receiver gain distribution. The set designer has this "handle" by which he can set the gain curve to the desired shape. The curves of Fig. 1 show sufficient r.f. gain adjustment so that the mixers are protected from large signal voltages for any signal within the range of the S-meter. Because mixers are somewhat critical in the application of bias, the first and second mixers are omitted from the controlled circuit and set at a suitable bias by voltage drop across a cathode resistor. The exact gain distribution within a receiver is not critical within the limitation that all stages must be held below the overload region with the highest signal level ordinarily encountered.

Strong signals outside the passband can reduce the set gain if rectified grid current flows in any stage which can charge up the a.v.c. line. A decoupling resistor and a low-resistance a.v.c. line minimize this effect.

Representative voltages for 0.5-volt input are 1.5 volts on the r.f. grid and 1.1 volts on the second mixer grid. At these voltage levels the mixer draws grid current and its conversion gain is reduced. The overload point for a receiver is defined as that input level at which a 6-db. drop in audio output occurs compared with the maximum audio output as the input signal is increased. Overload point for the 75A-3 is at 1.4 volts. A small amount of grid current in the mixer is not serious, as indicated by the fact that the overload point is well above the input at which the peak r.f. grid voltage applied to the second mixer exceeds its bias.

All s.s.b. operators will cry out loudly at the above statement. It is possible to tolerate grid current in a receiver mixer because the performance standards are so much lower than in linear amplifiers. In a s.s.b. transmitter it is desirable to keep intermodulation products down 30 db. Harmonic distortion of the signal in a receiver can be tolerated if it is 10 to 20 db. below the signal level. This explains the ability of the receiver mixers to operate satisfactorily with small positive grid voltages.

For the reception of weak signals described earlier, it is desirable to have as much gain as possible ahead of the mixers. This would insure that the signal level would be strong enough to override completely the noise from the pentagrid mixers. However, from the standpoint of strong signals, it is desirable to have low amplification until the selectivity of the receiver is effective. This would insure that only signals in the i.f. passband would tend to overload the set and these could be more readily accommodated by the high a.v.c. bias and gain control that is effective in the i.f. amplifier. These requirements for no amplification ahead of selectivity for strong signal reception and high gain in the antenna circuit and r.f. stage for weak signal reception are in direct conflict. It is fortunately possible to make an engineering compromise that will accommodate the majority of operating situations which confront the amateurs. Weak signals can be handled by using just enough r.f. stage gain to override the mixer noise by about 6 db. or slightly more.

### Cross-Modulation

When the receiver is tuned to a weak signal, and a strong signal is present outside the i.f. passband, then a different condition prevails than in the strong-signal case outlined above. There is very low a.v.c. bias generated to protect the grids of r.f. and i.f. amplifiers from grid current and only moderate gain reduction to prevent strong signals from stage to stage in the receiver.

The only gain-reducing elements present are a small amount of a.v.c. bias generated by the desired signal, and the selectivity of the r.f. and variable-i.f. coils in double-conversion receivers. The selectivity of these coils determines the r.f. voltage applied to mixers and i.f. amplifiers. With very large signals applied to any stage of the receiver, nonlinear operation causes modulation components of the strong signal to appear on the weak signal. This, in effect, means that strong 'phone signals *outside* the selectivity curve of the i.f. amplifier can still be heard. The term "cross-modulation" has been applied to this effect. Cross-modulation in a receiver is measured by a laboratory set-up as shown in Fig. 2. Two signal generators are used to simulate the two signals. One signal generator feeds the receiver through a resistor equal to the input impedance while the other signal generator feeds through a resistor of ten times the input impedance. The resulting impedance is then very close to the matching value. The signal generator feeding

through the large resistor is set for a value of r.f. that will produce an antenna terminal signal of, say, 10  $\mu$ v. (approximately S6) at receiver center frequency. The audio output is measured and signal generator modulation is removed. The second signal generator is then turned on and adjusted for 30 per cent modulation. At various frequencies near the receiver center frequency the r.f. level from the second signal generator is increased until the receiver audio output is 10 db. less than that measured with the first signal generator. A plot of these values for the 75A-3 operating at 4.0 Mc. is shown in Fig. 3. Adjacent signals at S9 + 40 db. can interfere if they are closer than 15 to 20 kc. from the desired signal. Approximately 50-kc. separation is required for signals that are 60 db. above S9. The cross-modulation curve of Fig. 3 is an inverse composite of the receiver input selectivity. The lower part of the curve is determined by the selectivity of the receiver circuits to the second mixer grid and the upper part of the curve is shaped by the selectivity

Fig. 3 — The cross-modulation characteristic of the 75A-3 receiver, with the receiver tuned to 4.0 Mc.

to the first mixer grid. The r.f. stage is never responsible for cross-modulation below 1 volt r.f. on the antenna for a 10- $\mu$ v. desired signal level. The portions of the curve at which the first and second mixer respectively contribute to the cross-modulation are indicated. A portion of the curve entitled "both" is a transitional area in which both mixers contribute to cross-modulation.

The application of a.v.c. voltage to the r.f. stage reduces its gain and helps protect the subsequent stages from excessive voltages. The matter of cross-modulation characteristics of an r.f. tube is extremely complicated, so just taking a given tube and applying a.v.c. bias is not the whole answer. There is no substitute for a large number of cross-modulation tests to determine proper r.f. stage conditions. There does not seem to be a receiving tube available that possesses the

# A Simple Rig for Six-Meter Mobile

*A Compact Transmitter That Is Easy on Both Pocketbook and Battery*

BY R. J. CARPENTER, \* W3OTC

• In at least two respects the 50-Mc. band is ideal for mobile operation. The average car radio whip is the right length, and low power will do the job well enough so that nothing in the way of special batteries or generators is required. Here's a 6-meter rig compact enough for steering-post mounting. It uses only two tubes, and will work nicely on a small receiver-type vibrator supply. You can build it for as little as \$21.00, complete; even less if you shop for bargains.

PERHAPS more people would go mobile if they didn't have to drill holes in their cars, bedeck them with special antennas, and install space-consuming boxes of gear that require something approaching Hoover Dam's power capacity. The 50-Mc. band is a big help in these problems. No special antenna mounts are needed, for the standard 54-inch broadcast whip is a respectable antenna system at 50 Mc. And the nature of 6-meter operation is such that a moderate amount of power works out surprisingly well.

A simple converter can be built that will give entirely satisfactory performance on 6. This article will describe a transmitter that should fill the bill on the counts of simplicity, small size, low total cost and low power drain. It is a complete 6-meter 'phone rig, running 7 watts input, built in a 3 × 4 × 5-inch box. Its total cost is

\* 1812 Arcola Ave., Silver Spring, Md.

<sup>1</sup> *The Radio Amateur's Handbook*, 1953 edition, p. 386.

about twenty-one dollars, including crystal and tubes.

As may be seen from the diagram, Fig. 1, the circuit is extremely simple. The basis for this lies in the use of 50-Mc. third-overtone crystals. These high-frequency rocks are no harder to use than their lower-frequency brothers, and their relatively high price is offset by the simplification

Interior of the W3OTC 50-Mc. mobile rig. Modulator tube and microphone transformer are at the right, modulation transformer and r.f. tube at the left.

resulting from their use. (I bought mine at \$1.50 each, but figured the crystal at \$7.00 in the cost estimate above.) Suitable 50-Mc. crystals can now be obtained from most of the better manufacturers.

## Circuit Details

The first section of a 12BH7 is operated as an overtone oscillator at 50 Mc.<sup>1</sup> The plate voltage to this stage is held down by a large resistor, to help reduce the crystal current. Developing sufficient drive for the final does not seem to be a problem. Switching for two crystals is provided, though some retuning may be desirable if the frequency shift is more than about 100 kc. The

♦

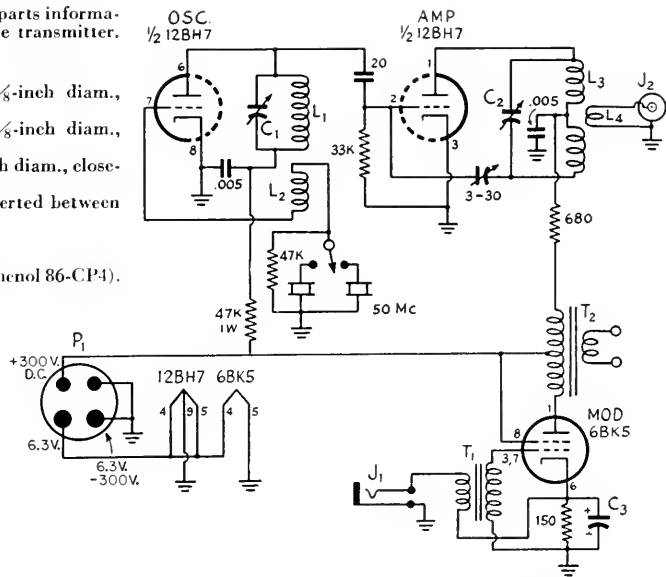

No, this isn't a converter—it's a complete 50-Mc. transmitter, audio and all. It runs 7 watts input, yet it is small enough for steering-post mounting.

♦

T<sub>2</sub>—Plate to voice coil transformer (Merit A2900).

The author wishes to thank John J. Nagle, W3JES, and George R. Sugar, ex-W3KQS, for their work on the photographic portion of this article.

## Tune-up

With the final disabled by removing its plate voltage, the oscillator is checked for operation

Under the chassis of the 50-Mc. transmitter may be seen, right to left along the bottom of the picture, the crystal switch, the oscillator coils and tuning condenser, and the final tank circuit at the far left.

# A One-Element Rotary for 21 Mc.

*Utilizing Readily Available Materials in a Simple Antenna*

BY LEWIS G. McCOY, W1ICP

LATELY, more and more amateurs are "discovering" the 15-meter band. Here is a band where it is possible to make long-distance contacts with low-power transmitters. Another feature of 15 meters is that antennas can be much smaller than those necessary for the lower frequency bands. The smaller antenna can be rotated to take advantage of the directional characteristics of an ordinary half-wave dipole.

Before discussing the actual construction of such an antenna, let's first clear up an erroneous impression about antennas that many newcomers seem to have. For some reason, many amateurs starting in the hobby get the idea that a horizontal half-wave antenna has no directional properties. In other words, they believe that when power is fed into such an antenna, the power will be radiated equally well in all directions. This is a completely mistaken concept. A horizontal half-wave antenna produces maximum radiation broadside to the radiating element. The least amount of radiation is from the ends of the antenna. Hence, a horizontal half-wave antenna is "bidirectional." If the ends of the antenna point north and south, maximum radiation will be east and west. To obtain the benefits of the directional properties of the antenna, it is only necessary to rotate it 180 degrees. Here are the constructional details for such an antenna that can be built for less than \$15, complete with mast, wall mounting and 50 feet of feed line.

<sup>1</sup> A half-wavelength antenna would normally be fed with 72-ohm cable, since the antenna offers a good match for this impedance value. In this antenna system, the shorter elements, plus the small coil, offer a good match for 52-ohm cable.

• Here is an antenna that practically builds itself. Made from electrician's thin-wall tubing, a material sold in any electrical supply store, its main feature is that no cut-and-try methods are involved in its construction. Build it according to the directions in the article, and sit back and watch "solid" QSOs pile up.

## Construction

The antenna is made from two pieces of ½-inch diameter electrical thin-wall steel tubing or conduit. This tubing is readily available at any electric supply shop and sells for approximately seven cents a foot. It comes in 10-foot lengths and, while 20 feet is short for a half-wave antenna on 21 Mc., with loading the length is just about right for 52-ohm feed line.<sup>1</sup> If aluminum tubing is available, it can be used in place of the conduit, and the antenna will be lighter in weight. However, it is sometimes difficult to obtain aluminum, while steel thin-wall conduit is available in any electrical supply house.

As can be seen in Fig. 1 and the photographs, the two pieces of tubing are supported by four stand-off insulators on a four foot long 2 by 2. The coax fitting for the feed line was mounted on the end of one of the lengths of tubing. A mounting point was made by flattening the end of the tubing for a length of about 1½ inches. The tubing can be flattened by squeezing it in a vise or

◆

This view shows a close-up of the coil and coax fitting mountings. Be sure that the coil doesn't short out to the outer conductor when soldering the coil end to the inner conductor pin on the coax fitting.

◆

Fig. 1 — (A) Diagram of the antenna and mounting. The U bolts that hold the 2 by 2 to the floor flange are standard 2-inch TV mast type bolts. (B) A more detailed drawing of the coil and coax-fitting mountings. The  $\frac{1}{4}$ -inch spacing between turns is not critical, and they can vary as much as  $\frac{1}{16}$  inch without any apparent harm to the match.

by laying the end of the tubing on a hard surface and then hammering it flat. This will provide enough space to accommodate the coax fitting (Amphenol type 83-1R). A  $\frac{5}{8}$ -inch hole will be needed in the flat section to clear the shell of the coax fitting.

The coil,  $L_1$ , is made from  $\frac{1}{8}$ -inch diameter copper tubing. It consists of 5 turns spaced  $\frac{1}{4}$  inch apart and is 1 inch inside diameter. The coil is connected in series with the inner conductor pin on the coax fitting and the other half of the antenna. In order to secure a good connection at the coax fitting, the coil lead should be wound around the inner-conductor pin and soldered. The other end of the coil can be connected with a screw and nut.

### Mounting

The antenna was mounted on a 1-inch floor flange and held in place by two 2-inch bolts, as shown in the photograph. The floor flange was connected to a 12-foot length of 1-inch pipe which served as a mast. Television antenna wall mounts were used to support the mast. In the installation shown, 19-inch wall mounts were used in order to clear the eaves of the house. A 2-inch long piece of  $1\frac{1}{4}$ -inch pipe was used as a sleeve, and it was clamped in the U bolt on the bottom wall mount. A  $\frac{1}{4}$ -inch hole was drilled through the mast pipe approximately 6 inches from the bottom. Then a  $1\frac{1}{2}$ -inch bolt was slipped through the hole and the mast was then mounted in the sleeve on the bottom wall mount. The bolt acted as a bearing point against the top of the sleeve.

Another  $\frac{1}{4}$ -inch hole was drilled through the mast about three feet above the bottom wall mount. A piece of  $\frac{1}{4}$ -inch metal rod, six inches long, was forced through the hole so that the rod projected on each side of the mast. To turn the mast, a piece of rope was attached to each end of the rod and the rope was brought into the shack, so that the antenna could be rotated by the

"arm-strong" method. Obviously, one could spend more money for a "de luxe" version and use a TV antenna rotator and mast.

RG-8/U 52-ohm coax cable was used to feed the antenna shown. For power inputs up to 100 watts, the smaller and less expensive RG-58/U can be used. However, when you buy RG-58/U, be sure that the line is made by a reputable manufacturer (such as Amphenol or Belden).

The antenna mounted against the side of the house, using TV wall mounts for holding the mast. The feed line comes out of the bottom of the mast and through the wall into the shack.

Some of the line made for TV installations is of inferior quality and is likely to have higher losses. The feed line was fed up through the mast pipe and through a  $\frac{3}{4}$ -inch hole in the 2 by 2. An Amphenol 83-1SP fitting on the end of the coax line connects to the female fitting on the antenna.

### Coupling to the Transmitter

It may be found that, when the feed line is coupled to the transmitter, the antenna won't take power. Since the line is terminated at the antenna in its characteristic impedance of 52 ohms, the output of the final r.f. amplifier must be adjusted to couple into a 52-ohm load. Where the output coupling device is a variable link, all that may be needed is the correct setting of the link. If the link is fixed, one end of the link can be grounded to the transmitter chassis and the other end of the link connected in series with a small variable capacitor to the inner conductor of the feed line. The outer conductor of the coax is grounded to the transmitter chassis. The condenser is tuned to the point where the final amplifier is properly loaded. Such a system is shown in Fig. 2. Incidentally, this is the type of system that could be used with the Heathkit transmitter.

Fig. 2—The variable coupling condenser,  $C_1$ , described in the text, can be connected as at (A) or (B), depending on which is more convenient for a particular transmitter. The condenser can be a receiving type of 50 to 100  $\mu\text{f.}$  capacity.

For transmitters having a pi-network output circuit, it is merely a matter of adjusting the network to the point where the amplifier is properly loaded.

In the event operation on 15 meters is in an area where one may have to contend with TVI, it may be necessary to use a low-pass filter to attenuate any harmonics likely to cause trouble. A simple filter was described in a recent issue of *QST*.<sup>2</sup> The filter is merely inserted in series with the coax feedline. This should take care of harmonic TVI problems.

### Performance

Several different tests were made with the antenna including on-the-air checks with U. S. and

<sup>2</sup> McCoy, "The Tin Can Low-Pass," *QST*, Sept., 1954.

Over-all view of the antenna and mounting.

foreign stations. The standing-wave ratio was carefully checked and at no point in the entire 21-Mc. band did the ratio exceed 1.3 to 1.

On the first CQ using the antenna, KP4WI answered and kindly consented to check the signal while the dipole was rotated. With the antenna broadside to him, his S-meter reading was 10 db. over S9. When the end of the antenna was pointed in his direction, the reading dropped to S1 to S3. Practically identical performance reports were received from W7SFK in Montana, from W5KC in Louisiana, and from DL2WW in Germany.

On reception, the variation from broadside to end was not as great as with transmitting reports. However, in many cases it was enough to make the difference between hearing a signal and not hearing one.

The simplicity of the antenna and the low cost, together with the improved performance over a fixed antenna, make it a worth-while project for an amateur interested in 15-meter operation. At the time of this writing, an OQ5 station in the Belgian Congo was heard on 15 meters working Novice stations. Who will be the first Novice DXCC?

Four weeks' notice is required to effect change of address. When notifying, please give old as well as new address. Advise promptly so that you will receive every issue of *QST* without interruption.

Using a 304-TH as a grounded-grid amplifier, this unit can utilize to good advantage the full output of any of a number of popular commercially-built transmitters for driving power. The push-rod operated band-changing switch can be seen projecting through the panel at the left-hand end.

## Grounded-Grid and the 304-TH

*Utilizing "100-Watt" Rigs for Driving*

BY THOMAS P. LEARY,\* WØVTP

ONE thing that bothers most of us about designing and building a final amplifier is neutralization. This old dragon is with us in all conventional triode circuits, and a great many tetrodes also require it. But, with the right tube, the grounded-grid circuit will put the neutralizing condenser and split-stator tank back in the junk box.

Still, we can't get something for nothing and grounded-grid operation requires four to six times the driving power. If we haven't already lost you, let's see what can be done with this arrangement.

Only the normal drive requirement of the tube is dissipated in the grid circuit; the remaining power passes through it and is added to the total power output. The filament, or input, circuit has a very low impedance, permitting the amplifier to operate as a Class B linear without swamping resistors.

Many amateurs own a Collins 32-V, a Johnson Viking or a homebrew rig with an output in the vicinity of 135 watts or more. When switching to higher power it seems a shame to dispose of this equipment, and somewhat ridiculous to use it to drive a final requiring only a few watts for the purpose. But such an exciter can be used without modification to drive a tube like the 304-TH to a kilowatt on c.w. or 750 watts on 'phone. With the same plate efficiency, the grounded-grid stage

can put out more power than a conventional amplifier since additional r.f. is obtained from the driver. And, because we have no need for neutralizing, a pi-section output is a simple addition to the circuit. In Class B linear service only about 25 watts of drive is required which results in 200 watts of a.m. carrier. With high level, 100 per cent plate modulation cannot be obtained by modulating the final alone, since a fraction of the output originates in the driver, but the extra carrier is useful in getting through the QRM.

The main requirement for a tube to be operated in this manner is a low plate-to-filament capacity. The 304-TH has a capacity of about  $0.7 \mu\text{f}$ , plus the added advantage of an internal shield connected to the grid. The grid, which is grounded for r.f. through a by-pass condenser, shields the input and output circuits from each other in much the same manner as the screen grid in a tetrode. The driving power required depends to a great extent on bias and increases as the bias goes up. At cut-off ( $-135$  volts with 2500 volts on the plate) the 304-TH can be loaded to draw 400 plate milliamperes with 135 watts of drive and 40 ma. of grid current. Under these

The top-of-chassis layout, showing the blower (left) and copper-tubing tank coil (right). The fixed output condensers of the pi network are at the edge of the chassis in the right foreground.

\*8506 Broadmoor Dr., Omaha, Nebr.

conditions, using a bank of light bulbs and a light meter, 800 watts output was measured. Since at least twice cut-off bias is desirable for good linearity with plate modulation, about -250 volts should be used for 'phone operation. One hundred watts will then drive the tube to 750 watts input, still with 40 ma. of grid current. However, it was found possible with this circuit to modulate the final at a kilowatt input with cut-off bias without any splatter or serious deterioration of quality.

A 304-TL may also be used but drive requirements will be increased about 30 per cent. As an example, if a 200-watt exciter is available, the 304-TL, with -380 volts bias and 3000 volts on the plate, can produce more than a kilowatt output with input at the legal limit.<sup>1</sup> Both types can still be found in surplus stocks for less than \$10.00.

<sup>1</sup> The power rating of a grounded-grid amplifier is not covered explicitly in the current amateur regulations, but FCC's interpretation is that the plate input to the "final stage" shall be considered to be the sum of the plate inputs to all stages contributing output power to the antenna. — Ed.

## Circuit

As can be seen from Fig. 1, drive is injected into the filament-grid circuit and the power output is taken between grid and plate. Power sensitivity is very low and if plate-filament feedback can be kept to a minimum no neutralization is required. This means that the input circuit must carry the regular filament current in addition to r.f., and ordinary bandswitching of the input is not desirable. To conserve space, the amplifier to be described was designed for 40, 20, 15 and 10 meters only. The main filament coil (a dual winding) is used alone for 40 meters and the other coils are switched in parallel to cover the higher frequencies. The 52-ohm input link is coupled to the filament coil only, and need not be varied over the different bands; however, some system of changing the coupling between the driver tank and coax line should be provided. The internal antenna coupler in transmitters like the Collins, or a pi-section in the driver output, is entirely satisfactory.

The amplifier output circuit will match a 52-ohm line. A 9000-volt tank condenser was found

S<sub>1</sub> — Single-pole 4-pos. steatite rotary (Centralab 2542).

S<sub>2</sub> — Single-pole 9-pos. progressive shorting steatite rotary (Centralab PA 2012). Two in parallel will be more satisfactory.

T<sub>1</sub> — 10-11-volt 12-amp. filament transformer (Thordarson 21F19).

An electronically-regulated bias supply was found to be desirable for c.w. operation when keying an earlier stage. If the amplifier grid leak is used as the bleeder on a bias supply delivering cut-off voltage, as is common practice, the bias supply must be unusually husky because of the low value of grid-leak resistance required. The bias supply circuit used is shown in Fig. 2. The control provides a means for varying the key-up bias between about 90 and 250 volts. Additional

the chassis. The tank condenser is placed just to the left of the tube and mounted upside down to obtain a short lead from the plate cap to the center of the stator. The R175A choke is placed horizontally with its top near the tube cap. The tank coil is mounted to the left of the condenser with the "cold" end toward the front. The coax socket, loading condensers and switch are located to the rear between the coil and condenser.

A small shield was found necessary above chassis between the 304-TH and the tank condenser, to eliminate capacitive coupling with the filament.

The main filament coil is mounted horizontally, lengthwise with the chassis, with the "hot" end just behind the base of the tube. To the right of the tube, under chassis, is the filament variable condenser. The 20-, 15-, and 10-meter coils are grouped compactly around the coil switch and

operating bias is obtained from the voltage drop in the 2500-ohm adjustable resistor when grid current flows.

This amplifier is the result of considerable sweat and experimentation and the builder may depart from the illustrated component layout at his own risk. Contrary to some published information, grounded-grid does not eliminate parasitics with these tubes and great care must be taken to keep plate-to-tank-condenser and filament-to-input-condenser leads short. The parasitic chokes and resistors should make up most of these leads. Complete shielding, without any inductive coupling, must be maintained between input and output circuits to prevent oscillation on the operating frequency.

The amplifier is mounted on a  $10 \times 17 \times 4$ -inch aluminum chassis. The filament components are located on the under side at the right. A dividing shield and ventilated bottom cover are placed over this half, while the left under side is used to mount the filament transformer and meters. A  $2\frac{1}{2}$ -inch hole is cut near the front of the chassis, with its center 7 inches from the right-hand edge, and the 304-TII is submounted so that the internal shield is level with the top of

The cathode tuned circuit occupies the left-hand end of the chassis in this view. The bifilar coil at the top is used on all bands, additional inductances being connected in parallel to shift the tuning to the band in use.

the ends soldered directly to the tabs on the switch. The opposite ends of all three are soldered together and connected by a short lead to ground.

The filament by-pass condensers are connected directly across the socket terminals. The parasitic choke and resistor are fastened between the right-hand forward socket terminal and the front stator connection of the filament variable condenser.

The filament transformer is located under the chassis in the left rear corner. The transformer specified is somewhat overloaded for this use and runs hot but it will deliver the voltage if the 11-volt primary tap is used.

We have the old-fashioned notion that nothing can beat air-wound copper tubing for a low-loss coil. There was no room in this set-up for a conventional high-power switch, so we hit on the idea of using fuse clips fastened directly to the tank coil. The coil itself is  $19\frac{1}{2}$  turns of  $\frac{3}{16}$ -inch copper tubing, 2 inches in diameter and  $7\frac{1}{2}$  inches long. First, close-wind the coil and spread it to 6 inches. Then spread the rear  $5\frac{1}{2}$  turns until the whole thing is  $7\frac{1}{2}$  inches long. The coil is supported on  $\frac{3}{4}$  by  $2\frac{1}{2}$ -inch stand-offs and soldered to screws in the tops of the three insulators at the 3rd, 8th and 18th turns (approximately) counting from the rear of the chassis. The fuse clips are soldered or fastened to holes in the tubing with small screws, in line at  $3\frac{1}{2}$ ,  $5\frac{1}{2}$  and  $8\frac{1}{2}$  turns, also counting from the rear. A piece of  $\frac{1}{4}$ -inch brass rod, with the point rounded, acts as a shorting bar between the clips and is connected to a piece of  $\frac{1}{4}$ -inch fiber rod with a shaft coupling so that it can be slid in and out from the front panel. A  $\frac{3}{16}$ -inch copper tubing lead runs from the front of the coil to the rear coax connector, and another fuse clip is fastened to this lead with a short piece of tubing so that it always grips the shorting bar to complete the connection. The whole assembly can be made quite rigid and the fuse clips make a positive, self-cleaning connection. Different points can be scribed on the fiber rod to indicate the correct setting for each band.

Heat-radiating connectors should be used on the grid and plate leads of the 304-TH. The grid by-pass condenser to ground should have practically no leads.

The parasitic resistors are of the Global type, available from General Electric TV parts dealers. They are about  $1\frac{1}{16}$  inch long,  $\frac{9}{16}$  inch in dia-

meter and come two to a package. The plate circuit parasitic choke is  $2\frac{1}{2}$  turns,  $\frac{1}{2}$ -inch diameter with the resistor paralleled across it with very short leads. The filament circuit parasitic choke consists of two turns wound directly on the resistor. Both are wound with No. 12 wire.

### Tuning and Operation

Since the filament and plate circuits are essentially in series, some differences may be expected in tuning as compared with an ordinary amplifier. Full excitation should not be applied without plate voltage on, since the rated grid dissipation will be exceeded and tube damage can result. Some way of reducing driving power, such as switching resistance in series with the plate supply primary of the exciter, should be provided.

First apply *reduced* excitation with plate voltage off. Do not exceed about 60 ma. of grid current; it will peak at the resonance point of the input condenser. Then resonate the plate condenser, which will be indicated by an increase in grid current. It will be noticed that some plate current will flow even without plate voltage, and a dip will be found at resonance. Now apply reduced plate voltage through a series resistance, like a 500-watt photo-flood bulb, in the primary of the plate transformer. With bias reduced below cut-off, make the usual checks for parasitics with different settings of the tuning condensers. Then apply full voltage. Grid current will probably disappear, so increase excitation and make additional adjustments for maximum grid and minimum plate current. Loading can be controlled with the variable loading condensers. Keep an eye on the plate current drawn by the driver stage while making adjustments in the final, as coupling may have to be reduced to keep the driver tube from exceeding its ratings. Bias may be reduced to near cut-off for c.w. in order to obtain at least 40 grid milliamperes at a kilowatt input; however, the more bias the better the plate efficiency. With practice, the stage may be moved around the band very quickly; the filament circuit tuning is fairly broad and requires only occasional adjustment.

For Class B linear amplification of an a.m. signal, maximum input is 500 watts. Reduce the drive to about 25 watts or until no grid current flows without modulation. With modulation it should rise to about 20 ma. in peaks with bias

*(Continued on page 126)*

The shorting rod for band changing runs along the side of the tank coil, making contact with fuse clips fastened to the proper turns on the coil.

# General Techniques of 10-Meter Mobile Noise Reduction

## Wavetraps as Ignition Suppressors

BY TALMADGE R. ENGLAND,\* W4MJJ

• In this article, W4MJJ discusses the use of tuned wavetraps in suppressing electrical noise in 10-meter mobile installations.

**M**OBILE OPERATION of amateur stations is ever becoming more popular, and especially will this be true if ten meters finally does open wide next year (it's always next year!). What follows is intended to give the would-be mobileer a fundamental insight into the cause of the biggest headache of mobile operation — noise. Compared to the elimination of noise, especially in the ten-meter band, the actual installation of the equipment is comparatively easy.

Now every ham knows that whenever a spark occurs some r.f. noise is generated. In fact, it is not at all necessary that there be a spark — merely a surge of current. The current surge induces transients in the associated wiring or, what amounts to the same thing, it “shock”-excites the inductance and capacitance of the wiring into a damped oscillation. Due to the random distribution of these two parameters, the oscillations occur at many frequencies. It is probably unnecessary to point out that the car's ignition system is the biggest noise producer, with the generator and regulator trailing. Indeed, if ten-meter operation is contemplated, you had best decide that complete elimination is impossible, and purchase or build a good noise limiter at the outset. However, the limiter, used in conjunction with standard methods of suppressing noise in its various and sundry spots, and traps in the ignition system (to be described), will reduce the interference to a most tolerable level.

While standard methods of noise suppression are aptly detailed in late editions of *The Radio Amateur's Handbook* and will not be repeated here, it will be interesting to enumerate the basic methods in a general manner. By keeping in mind the simple idea of what transients are and how they arise, the following seven methods of reducing or eliminating them are evidently fundamental: (1) elimination of  $L$  and/or  $C$ ; evidently, no oscillatory transients would then be possible — but neither is the method. (2) Elimination of the spark. This is not so impossible as it sounds, for that is precisely what we do when graphite grease is used in the wheel

bearings to eliminate wheel static. (3) Damping the oscillation. This is the usual method of reducing ignition interference; i.e., by installing resistors in the wiring. Unfortunately, this method is not applicable to other parts of the electrical system. (It is interesting that from a theoretical viewpoint there is a critical value of damping resistance beyond which no oscillatory transients are produced, but the value is too large to be of practical use.) (4) Shielding of wiring. (5) Grounding of such possible radiating elements as the tail pipe. (6) By-passing of the various electrical

A trap installed at a spark plug in W4MJJ's car.

components of the car, such as dome light, gas gauge, etc. It should be kept in mind that a car's electrical system, being of low voltage, is a low-impedance system. By-passing is, therefore, not so effective as might be expected. (7) Rejection by the use of tuned traps or chokes.

The last method has been too much neglected. Although some amateurs do use tuned traps in the generator lead, no one seems to have tried them in the ignition wiring. The author installed traps on each plug, and inserted similar traps in the main tower of the distributor, and at the generator and the regulator. The generator and regulator traps practically eliminate noise from these two sources, whereas by-passing will not. Noise rejection in the ignition system is at least as good as that obtained with resistor suppressors. But where ignition interference is concerned, the

# Using the 6524 Dual Tetrode on 432 Mc.

## *A Tripler-Amplifier To Follow Your Present 2-Meter Rig*

BY EDWARD P. TILTON, W1HDQ

THE fellow who wanted to put more than a couple of watts on 420 Mc. had little in the way of tube choice until recently. There were only a few transmitting tubes on the market that would do the job, and prices for these began at around \$25.00 each. Introduction of the Type 6524 dual tetrode recently<sup>1</sup> by RCA should help to promote more use of the 420-Mc. band, as this new tube can be bought for considerably less than anything we've had available previously.

Designed especially for u.h.f. mobile service, the 6524 is a natural for use in 420-Mc. amateur work. Operating from a plate supply of 300

power into the transmission line, and of course the shielding is an aid to TVI prevention.

The main chassis is fitted with a bottom cover. Air from the fan mounted on the rear wall is circulated up around the tripler tube, at the left, and through  $\frac{1}{4}$ -inch holes below the amplifier tube. Holes in the top cover are the only means for this air to escape, and thus the cooling flow is concentrated where it will do the most good. The number of holes in the top cover, and in the chassis under the amplifier tube, can be varied until an equal flow of air appears to be coming through the two top sets of holes. This can be checked readily by noting how

◆  
Tripler-amplifier for 432 Mc. Note that complete shielding and forced-air cooling are employed.

to 375 volts, one 6524 as a tripler will drive another as a straight-through amplifier. Output from the tripler stage can be as much as 8.5 watts, and the amplifier will deliver up to 20 watts. These ratings are for 470 Mc., so some leeway is left for the amateur in getting efficient operation at the third multiple of his 2-meter frequency.

The transmitter shown here is a modernized version of the dual tetrode rig that has appeared in the *Handbook* for some years. It can be driven with a 2E26 amplifier on 144 Mc. readily, as the driver power output need be no more than 4 to 6 watts at 144 Mc. Output on 432 Mc., under plate-modulation conditions, is a good 12 watts; enough to make quite a respectable signal. On f.m. or c.w., it can be boosted to the 20-watt ICAS operating conditions.

### Construction

It will be noted that provision is made for enclosing the tubes and tank circuits completely. The enclosure serves two purposes: it provides a path for circulation of cooling air, and holds down radiation from the tank circuits. The latter consideration is important in getting

briskly a sheet of paper rises from either set of holes when the fan is started. This check should, of course, be made with the bottom plate in place.

The fan shown provides a flow of 17 cubic feet per minute, more than adequate for the job, so no great care was taken to stop small air leaks. Where a smaller fan is used, all air holes should be plugged. Small holes and cracks can be sealed with household cement, and the meter jacks should be plugged in this case.

The tripler tube is mounted vertically, at the left, with its socket  $1\frac{1}{2}$  inches below the chassis. There is just room under the socket for the self-resonant input circuit,  $L_2$ . The amplifier tube is horizontal, with its socket mounted in back of a plate that is 8 inches from the left edge of the  $3 \times 4 \times 17$ -inch aluminum chassis. The shielding enclosure is  $3\frac{1}{4}$  inches wide by  $3\frac{1}{2}$  inches high.

Half-wave lines are used in all 432-Mc. circuits. The grid circuit of the amplifier is capacitively coupled to the tripler plate line, the two overlapping about  $1\frac{1}{4}$  inches. The spacing between them must be adjusted carefully for maximum grid drive. Plate voltage is fed to the lines through small resistors. These should

be connected at the point of lowest r.f. voltage on the lines. The amplifier grid r.f. chokes are connected at the tube socket.

Some interesting "bugs" were encountered in the development of this layout. A haywire test set-up was made to check the operation of the new tubes. They worked fine, so a "final" form was evolved as shown, except for the variable capacitors used for tuning the plate lines. At first we used a split-stator unit equipped with metal end-plates that grounded the rotors. With these the tripler gave more output on the second harmonic than on the third. When the rotor was ungrounded there was a considerable improvement. As this particular capacitor could not be mounted conveniently without grounding the rotor, we next tried the capacitors

specified. These have metal mounting brackets, but they are not connected electrically to the rotor shaft. Even with these units, using the metal brackets grounded to the chassis threw the tank circuits out of balance, so it was necessary to mount the capacitors up on edge, on polystyrene plates. With this arrangement there was practically no second harmonic in evidence in the tripler tank circuit, and both it and the amplifier circuit tuned normally and showed good efficiency.

## Testing

The tripler-amplifier is designed to operate in conjunction with a 144-Mc. transmitter such as the 2E26 rig shown in October *QST*.<sup>2</sup> A plate supply of 300 volts at 200 ma. is needed. Apply power to the 144-Mc. driver stage and adjust the spacing of the turns in  $L_2$  and the degree of

<sup>2</sup> Tilton and Southworth, "A Step-by-Step Station for the V.H.F. Man," *QST*, October, 1954, p. 16.

Bottom view of the tripler-amplifier, with plate removed. The tripler tube socket is at the right.

coupling between  $L_1$  and  $L_2$  for maximum tripler grid current. This should be about 3 ma.

Next apply plate and screen voltage to the tripler and tune  $C_1$  for maximum grid current in the amplifier, with no plate or screen voltage to the latter. Adjust the position of the grid lines with respect to the plate circuit, readjusting  $C_1$  whenever a change is made, until at least 4 ma. grid current is obtained.

Now connect a lamp load across the output terminal,  $J_2$ . Ordinary house lamps are not suitable. A fair load can be made by connecting 6 or more blue-bead pilot lamps in parallel. This can be done by wrapping a  $\frac{1}{4}$ -inch copper strap around the brass bases and soldering them all together. Then another strap should be soldered to the lead terminals. Apply plate and screen voltage and tune  $C_2$  for maximum lamp brilliance. It should be possible to develop a very bright glow in the 6-lamp load with a plate current of about 100 ma. at 300 volts.

Cut drive very briefly to check for oscillation in the final stage. Grid current should drop to zero. The rig is then ready for use. The screen and grid resistors shown are for operation with plate modulation. Somewhat more output and input can be run if the screen or grid resistance is decreased slightly, but this should be done only when the rig is to be used for f.m. or c.w. service.

Operating conditions are about as follows: tripler grid current—2 to 3 ma.; amplifier grid current—3 to 4 ma.; tripler plate and screen current—90 ma.; amplifier plate and screen current—110 ma.; output—12 watts.

In choosing the operating frequency it is well to bear in mind that nearly all work being done in the 420-Mc. band involves tripling from commonly-used frequencies in the 2-meter band. By mutual agreement, to make it a relatively simple matter for stations using narrow-band techniques to find one another, stabilized transmitters are kept between 432 and 436 Mc.

This tripler-amplifier was built around the 6524 tetrodes, but the same general construction can be used with other dual tetrodes such as the 6252 and 5894A by Amperex and the 832A. With the 6252, operating conditions will be quite similar to those given above. With the 5894A (9903), up to 40 watts output can be

obtained on c.w. or f.m., and 25 to 30 watts with plate modulation. The 832A will deliver only about 5 watts. The pin connections given in the schematic diagram are for the 6524.

## WWV-WVVH SCHEDULES

For the benefit of amateurs and other interested groups, the National Bureau of Standards maintains a service of technical radio broadcasts over WWV, Beltsville, Md., and WVVH, Maui, Territory of Hawaii.

The services from WWV include (1) standard radio frequencies of 2.5, 5, 10, 15, 20 and 25 Mc., (2) time announcements at 5-minute intervals by voice and International Morse code, (3) standard time intervals of 1 second, and 1, 4 and 5 minutes, (4) standard audio frequencies of 440 cycles (the standard musical pitch A above middle C) and 600 cycles, (5) radio propagation disturbance warnings by International Morse code consisting of the letters W, U or N, together with digits from 1 through 9, indicating present North Atlantic path conditions and conditions to be anticipated. (See Measurements chapter of recent *Handbooks* for details on forecast symbols.)

The audio frequencies are interrupted at precisely one minute before the hour and are resumed precisely on the hour and each five minutes thereafter. Code announcements are in GMT using the 24-hour system beginning with 0000 at midnight; voice announcements are in EST. The audio frequencies are transmitted alternately: The 600-cycle tone starts precisely on the hour and every 10 minutes thereafter, continuing for 4 minutes; the 440-cycle tone starts precisely five minutes after the hour and every 10 minutes thereafter, continuing for 4 minutes. Each carrier is modulated by a seconds pulse, heard as a faint clock-like tick; the pulse at the beginning of the last second of each minute is omitted.

## Strays

VE2QQ should be ready for the Commandos after his recent experience in "hitting the beaches." Within an hour, he raised K2EP, Long Beach, N. Y., W4BTO, Palm Beach, Fla., and W6MPY, Long Beach, Cal., all on 40-meter c.w.

# Results - 1954 W/VE Contest

Gordy Webster, VE2BB, contest chairman of the Montreal Amateur Radio Club, sponsors of the W/VE Contest of last September 25th and 26th, announces final results of the activity. Leading Canadian score was that of Russ Wilson, VE6VK, who posted 37,725 points by working 252 stations in 50 sections. Across the border, W9PZT led all U.S.A. entrants with 17,853 points. In the tabulation below, the first-listed station in each ARRL section is a certificate winner. The figure following each call indicates the final score.

## NEW BOOKS

**Obtaining and Interpreting Test Scope Traces**, by John F. Rider. Published by John F. Rider Publisher, Inc., New York. 186 pages, 5½ by 8½, paper cover. Price, \$2.40.

Covers composition of waveforms of various types frequently encountered in practical work, how to adjust the oscilloscope for proper operation, and how to interpret what the scope shows. Particular attention is paid to pattern faults such as are caused by hum, distortion, and similar spurious effects. Chapters on Lissajous figures and various kinds of test set-ups are included.

**How To Use Test Probes**, by Alfred A. Ghirardi and Robert G. Middleton. Published by John F. Rider Publisher, Inc., New York. 172 pages, 5½ by 8½, paper cover. Price, \$2.90.

Operating characteristics, design considerations, and use of probes designed to work in conjunction with vacuum-tube voltmeters and oscilloscopes. The probes covered range from high-voltage d.c. and a.c. types through rectifying and demodulator types for low and high frequencies.

**How To Service Tape Recorders**, by C. A. Tuthill. Published by John F. Rider Publisher, Inc., 480 Canal St., New York 13, N. Y. Pub. No. 167. 154 pages, including index, 5½ by 8½, paper cover. Price, \$2.90.

Principles of recording on magnetic tape, with both general and specific operating and servicing data on current commercial equipment.

**Technician's Guide to TV Picture Tubes**, by Ira Remer. Published by John F. Rider Publisher, Inc., 480 Canal St., New York 13, N. Y. 160 pages, including index, 5½ by 8½ inches, paper cover. Price, \$2.40.

Describes the construction, operating principles and electrical characteristics of picture tubes, including projection and color. Accessories such as yokes, focus coils and ion traps are covered, with adjustment and repair data for the service technician.

# Three Stormy Sisters

## Part I—Carol and Edna

BY GEORGE HART, WINJM

• So many reports were received on amateur emergency activities during the three hurricanes that it became impossible to tell a complete story in allowable QST space for a single issue. We'll tell you about Hazel in a future QST.

TROPICAL HURRICANES are fickle and unpredictable things. Perhaps that's why they are given women's names. Not since 1944 has the Northeast received a visitation from a tropical storm, but this year, one decade later, as if to make up for past omissions, three screaming hurricanes, spawned in the Caribbean, made their destructive way up the Atlantic Coast. First Carol curved in out of the Atlantic, brushed Hatteras, howled up the Western Atlantic to hit the end of Long Island and deliver a smashing blow to Connecticut, Rhode Island and Eastern Massachusetts as she failed to curve out to sea as expected. Two weeks later Edna started north, maintaining a more easterly course and wreaking most of her havoc on Nantucket, Cape Cod, the Maine coast and the Canadian Maritime Provinces.

But Old Dame Nature was not yet through with her shenanigans. Early in October she whopped up a hurricane to end all hurricanes, and this one she named Hazel. Again coming up out of the Caribbean, Hazel struck inland as far south as Myrtle Beach, S.C. Through North Carolina, Virginia and Maryland she screamed in full fury. In the mountains of Central Pennsylvania she lost some of her force, only to gather herself for one last blow at the Toronto area before she dispersed.

Each of these stormy sisters wept millions of gallons of rain, tore down telephone and electric lines in witch-like fury, washed out roads, tore off roofs and smashed houses as though they were made of paper, and sent high tides with enormous waves smashing against beach resorts. In all areas, radio amateurs were called upon to provide emergency communication. Many of them have written Headquarters to tell us about it, and we intend to chronicle them here. Many more have never let us know what they did. This account is written on the basis of reports received.

### Carol

The Nassau County, L. I., AREC was alerted by the Red Cross at 1210 on August 31st, and W2KFV was put into operation on 10 and 2 meters. Mobiles were dispatched to East Rockaway, Long Beach, Atlantic Beach, Point Look-

out, Island Park, Oceanside, Freeport, Baldwin, Jones Beach, Gilgo Beach, Bellmore, Wantagh and Seaford on the south shore, and Manor Haven, Port Washington, Sea Cliff and Bayville on the north shore. A portable 2-meter station was set up at Red Cross headquarters in Mineola. The County c.d. station was activated on 10 and 2 meters with a link to Red Cross headquarters, from which contact with mobiles was maintained. W2KFV operated from Red Cross headquarters, with W2QBR relieving, and at c.d. headquarters W2JKX operated on 10 and W2KEB on 2, assisted by K2EQH.

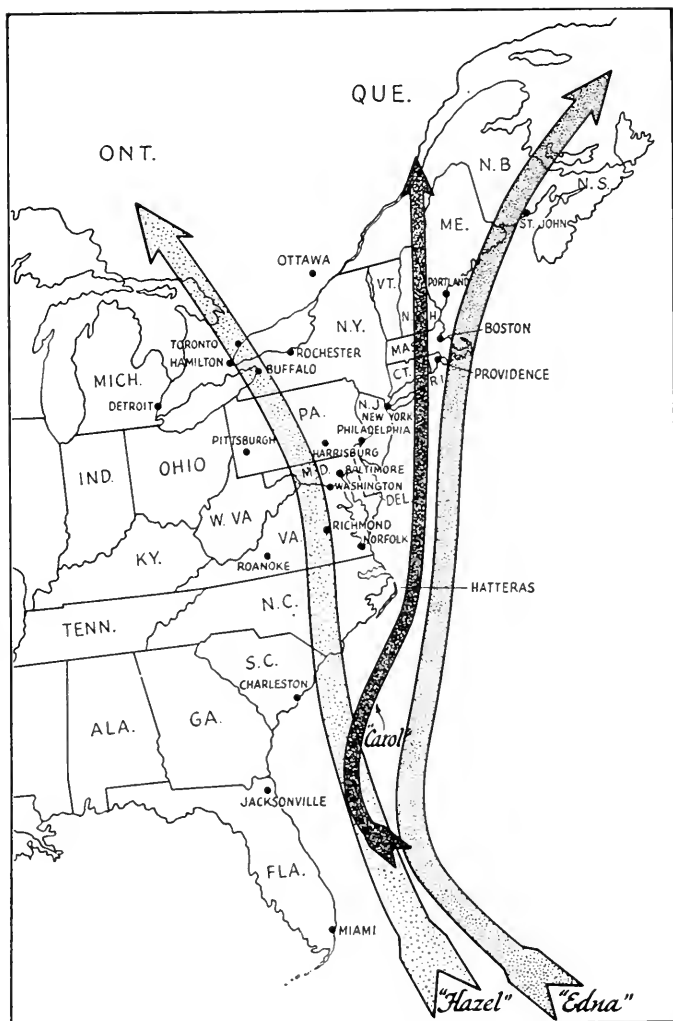

Contents of messages were such as reports of bridges out, trees down across highways, electric wires down, roads washed out and fire reports. The two-meter station at Red Cross was secured at 2135 after a message of commendation had been read from the disaster chairman. Mobiles in operation were W2s GCK GPQ KCW LLR VQI Y1L and K2EWB. Mobiles standing by were W2s DBI DUS KRP OME, K2s AXF and CCM. W2LBJ was in use as a fixed station. Other stations checked in and standing by were W2s ANN AZA KNA NRL QFH TUK UGF ZAI, K2s BGO BJG CNN and EAF. K2DHC was the call used at Nassau County c.d. headquarters.

At 1000 EDST on the morning of August 31st, W1VXL, the station of the Cranston Radio Association located at the Red Cross building, was put on the air by W1OGY as winds reached hurricane velocity in that area. Mobiles W1BTY, W1LZY and W1YKQ called in shortly afterward, en route to the club. When power failed, W1OGY assumed NCS duties from his mobile until W1VXL switched over to emergency power. By 1230 the Cranston Civil Emergency Net was in full operation with W1POP operating W1VXL and six mobile units out patrolling or standing by. A link on both 10 and 2 meters was established with W1AFO/1 at Cranston Police Headquarters. Other mobiles were W1s ZBZ and YRY. Others standing by were W1s JYF OOX RUS WUH ZPG and W1V1s BQB and YVW.

In the late afternoon, W1WSY, at state civil defense headquarters in Scituate and other RACES stations were activated on 2 meters with W1WKO coordinating information for this net from the governor's office. W1VXL and W1AFO/1 also established links with W1WSY and W1WKO. Operation was terminated about midnight. Accomplishments: many messages handled for the mayor and Cranston police; several trips to accompany Red Cross vehicles; handled Red Cross and other emergency traffic; picked up blood plasma, delivered it as

◆ This chart shows the approximate paths taken by the three hurricanes. In terms of damage, Carol exceeded Edna, but Edna was the largest in size, Hazel was the largest of all in both categories, and we'll tell you more about her in the next installment.

◆

directed. After the NCS had secured, W1s YKQ, LZV and YRY traveled in convoy headed by the state c.d. director to the southern part of the state to attempt a survey of damage and leave a portable generator at the Narragansett fire station to aid in setting up radio communication.

Amateurs in Hingham, Mass., under direction of EC W1MD, conducted fire patrol, since most of the city's telephones and fire-alarm circuits were out. The following amateurs participated in this activity: W1s AYG BIY DMS MD NMK SXN and W5HNW.

In the New Bedford area, W1AVY/1 was activated on 75 meters and W1WKM on ten. The following operators were on watch at these stations: W1s AEN\* AGG\* AVY\* AWH\* BMQ\* CTZ\* HPH\* LAZ\* MHN OH\* TZU\* UID WU\* WGN\* and ZPE\*. Those marked with an asterisk also operated mobile rigs when not on duty from one of the control stations. A total of 538 messages was handled to and from the area. New Bedford nets also tied into Fairhaven on ten meters, where about 15 mobiles were coöperating with local police and military.

The Cape Cod-Islands Emergency Net on 3912 did a very fine job restricting traffic for Cape and Islands. Other nets active were the Deep Sea Dragnet on 3970, Transcontinental Phone Net on 3970 and the Early Bird Net on 3845.

In Worcester, the RACES net was activated within a matter of minutes by Radio Officer and

EC W1SPF. Most of the damage suffered was from rain, although power was off over most of the city. Emergency power was supplied for c.d. headquarters by the ROTC at Worcester Tech. W1SPF reports 28 amateur radio operators on duty, plus four girls with restricted operator permits and 14 more waiting in reserve. The following are particularly to be commended for their work: W1NZD/m, who was the first to report; W1AET, who took net control; W1SPG for his fine work in relaying; and W1QCQ, who took over at W1YEW net control. Other amateurs participating in the order in which they made their appearance: W1s VDT LIB/m TJQ ONA/m SDU NZD/m UQL/m VLN/m AJV NNI/m UQW/m ZJW/m CS YPG RIL ZTL VPE/m SPG/m VGH CLU/m AAP/m JWM/m and VYK.

In Norfolk (Mass., that is), emergency operation was complicated by a prison break from the Norfolk Prison Colony. The hurricane hit its peak here at about 1500, August 31st, and took out all

means of communication other than radio. A gasoline-driven generating plant was set up at the fire station and the amateurs alerted. *W1s* WMN VQN BFV MJO and MGL responded, and MJO was dispatched to the state prison colony. *W1s* MNW, VQN and BFV were assigned to street patrol. At 2245 a report from the prison colony indicated two prisoners had escaped and were on the loose. This necessitated the setting up of road blocks and an even greater need for communications. The Norfolk gang were on duty for 48 hours without any sleep. EC W1CLF reports that the prison colony superintendent and the Norfolk police chief were high in their praise of the work done by the amateurs.

Carol's full force hit Haverhill about noon on August 31st, by which time telephone service was already partially disrupted. At 1245 W1SIX was set up at police headquarters and made contact with W1CCF/1 at c.d. headquarters, W1FW operating, and also with W1CCF/mobile in downtown Haverhill. By 1330 mobiles included *W1s* SNZ QYR QZS QGD NAG UHH and WN1ZUB, all cruising the city to report fallen trees and wires down. *W1s* WXE RYV WTK and WN1AFM came on later, all on a spot frequency of 147 Mc. With almost every road out of the city blocked by fallen trees and live wires, all mobiles had plenty to do. Fire-alarm and police signal systems were also out. The stations went off the air 0800 September 1st. Later, a fire patrol was set up tying various fire stations together and tying West Newbury, Mass., in with the Haverhill system. This set-up was in operation until September 15th.

The hams in Braintree became active starting at 1100 on August 31st, when W1VTH decided to activate W1TYN, the civil defense station. Thirty-three stations reported in, of which 22 were mobiles. At W1TYN, W1VTH was joined by W1VMU. As damage reports poured in, mobiles were dispatched to various locations, often accompanied by a policeman, to try to keep everything under control. Emergency power was necessary at 1206, and W1TYN was off the air until 1225. W1JOB relieved W1VTH and W1VMU at 1845, but VTH was back on the air from his mobile after a short rest and some chow. Also operating at W1TYN were W1QPH and W1OSX (Braintree c.d. Comms. Officer), and the station was on the air until 2250. Other amateurs participating in this area: *W1s* IA AUU EKG FQK JQA KJD KPX MPT OFO OKE RES RGS ROB SMC TQQ UYK VBB VPR WFQ WNT WSN YMV YYZ YZG YZP ZPI ZWQ.

In Framingham, W1MEG reports six mobile units in action: *W1s* WMT LPM RVA MEG WPW and QQW. In Lynn, EC W1JLN reports some of their mobiles went to Saugus and were received heartily. They helped patrol the town.

The situation was such in Arlington by 1030 that the town manager ordered the c.d. hams, the auxiliary police and the auxiliary firemen alerted. W1LXR and W1THO were the first alerted, and moved to activate the control station at the civil-defense director's office. W1WBX acted as net

control operator while W1LXR and W1THO began a mobile patrol of the town. W1LLY and W1CTW entered the mobile net during the afternoon. Meanwhile, the six-meter net went into operation jointly with the auxiliary police, looking for live wires on the ground. Mobiles were *W1s* BAQ CTW FWQ LLY LXR NBI THO VCZ and WYC. W1WBX and W1WYC alternated as control-station operators, and W1WBZ helped maintain equipment.

At the peak of the storm in Dedham, EC W1SH requested W1LYL to report to the police station to assist in getting the town's police transmitter back on the air, since power was off. W1LYL ran 200 feet of power cable from the basement to the transmitter on the top floor. The c.d. units were then able to operate on 10 and 2 meters. Returning to his home, LYL had to restore his own equipment to operating condition, to go into operation on 75 meters for ten consecutive hours. A big day's work for LYL.

In Winthrop, W1TTH and WN1BOX were first to recognize the seriousness of the situation and report to the control center. By 1030 the emergency generator was functioning. W1CMW also activated himself, and very shortly there were 10 stations on the air. Other self-activated stations were *W1s* VIS, UOC, and HFJ. Shortly after 1030 the power went off, and the emergency generator was put on the line to supply the entire building, including police radio control equipment, the state warning and emergency civil-defense equipment, lights, etc. W1TTH did most of the operating from the control center. The six-meter net was also activated and contact was maintained with Sector 4 headquarters in Newton throughout the emergency. The XYLYs helped out as operators during the hurricane and deserve a lot of credit. Both in daylight and at night, mobile units were used extensively, moving from place to place with reports of conditions, cooperating with police and fire units. Operators in this work were *W1s* UOC TTH HFJ BB and WN1BOX, with W1BDU at the control station. W1DJ manned the Cottage Hill unit and W1GGP made himself available at the hospital unit.

In Bedford, W1RSY was on the air within minutes after Carol was reported, and was joined by W1BFV, who was assigned to the Veterans Hospital, and by W1ACE/m who went to Hascomb Air Force Base. W1VCX was on stand-by from Maynard until his own area was alerted. When W1RSY lost both his tower and power, he got on from his mobile rig. C.d. headquarters was activated by W1YFP, and later joined by mobiles *W1s* VGC EIQ WAE and WME. *W1s* NAD and NDI drove to Acton to assist W1TRD who was operating alone there. Activity continued from 0900 August 31st to 0600 September 1st. *W1s* TCG UHV YEP and ZSG were also active.

### Edna

After the unorthodox behavior of Carol, Edna was tracked very carefully, both by the Weather Bureau and several amateur general-coverage

nets. But Edna, although larger and more ferocious than her predecessor, followed a more easterly course. Amateur networks were alerted and put to work all along the coast as Edna made her ponderous way northward, and indeed considerable damage was done in many coastal areas. This rampant female finally spent the last of her fury in the Canadian Maritime Provinces.

The Transcontinental Relay Net, operating on 7042 kc., and a special Hurricane Net set up on 3910 principally through the efforts of W1SS, followed the course of Edna very closely, relying principally on reports from amateurs in her way. TCRN was on the alert as soon as Edna was born, watching her closely as she moved north-eastward at first slowly, then with gradually increasing speed, staying a hundred miles or so off the East Coast. W4ATA was the principal source of information at first, and he gave the net several advisories until September 9th, when Edna started moving toward the Carolina coast; then W4LM of Charleston reported in to help, and later W4PHJ helped supply weather information. As Edna moved northward, TCRN not only kept track of her closely, but got stations all over the nation into the network to handle possible hurricane traffic. At 1215 EST W2BO reported that the hurricane was expected to miss most of New England, brush the tip of Cape Cod and pass out to sea from that point. As the storm went past the New England coast, W1LHA and W1DTB gave frequent reports, the latter indicating that the worst was over at 1900 EST. The following were logged by W3CVE as having participated: W1s ARR FEQ DTB ONX PJF YEJ LHA, W2s BO IH JOA, K2s AEQ BJS, W3WV, W4s PL ATA TKR LM VIIH UWE TYU PHJ WXL/4, W5s NRC GWT/4 RN ALZ CDP W6SWP W7CCL, W8s IZQ FUM DNC JWG, W9s SG GGG JUJ DUA UNJ SWM, W0s KA NAW, KP4s UH ZW, KL7ATO/W9 — and W3CVE, of course.

W1SS organized a Hurricane Net on 3910 kc. during Edna. Constant reports of movement of the storm, wind velocity and barometric pressure readings all along the coast from New Jersey to Nova Scotia were made available to the Associated Press, the United Press and the International News Service, as well as to the general public

Here's the operating position from which W1SS controlled the Hurricane Net on 3910 kc. That's W1SS himself in the middle, while W1UPZ gets the Weather Bureau on the telephone and an INS reporter takes notes on the operation.

and stations listening to the frequency. Due to experience in participating in emergency nets, the coordination and cooperation of all the 47 stations that comprised the net made for smooth and consistent operation. Actually, W1SS counted 131 stations reporting in at one time or another, including the following: W1s AFK AHX AWI AC AVY BNW BUD BLM CNX DKS ERG EKN EAB EHT FZT GGV GMH GIX HSC IAS JWV JOJ JN1 LYJ LBH LHZ LYD LBP LYV LOS MFI MBQ MAE MJD MLT NBP NCT NRZ OQT OKH PNR PCY PZY PAZ PRK QLL QU QHC QPU RYJ RNA RYX RMZ RGR SBP SAN SGL SAI SLW TOP TID TAY TFE TZL URR UDF UV UMC ULY USS URA VDB VXR VRM VTX VYI VRM VRT WGP WKI WNM WNK WLM YQV YLG ZNE ZNF ZCH ZJM ZEL ZET K1WAB K1FCR, W2s ACO BKC BTB CRX DMK EEO GKQ GTE GMW HJR ILI IVI MQB NKD NXZ QIH TXI ZOL ZZG, K2s AX AAO ADV BFD BDW CBU EF EOF EON GMV W3BHK W4NI K4AF, VE1s AAO DW VE2DW. Special thanks are extended to the stations that monitored the frequency above and below the net frequency and assisted in keeping the band clear.

The First Regional Net of NTS was in operation during most of the hurricane. W1TVJ started monitoring at 0650 EST Sept. 11th and officially opened the net for business at 0750. Eighteen stations reported in: W1s CRW/m USM CPV HUM RRX BY VGX LV ARR, W2s IVU AEE VNJ LJM JVG LPJ JOA, K2s DKM and BJS. W1BY took NCS during part of the day, while TVJ worked for his local c.d. At 1800 he reassumed NCS and the following additional stations were in the net: W1s KYQ OAK OHT RRX VVA W3WV VE1XB and VE3BJV. The Net was greatly hampered by bad conditions in the evening and W3WV assisted in relaying. At 2300 the net was closed, but TVJ continued monitoring until 0100. At 0740 on Sunday he was on the job again, and the following additional stations were QNI: W1s WCC POK IMY COC YAO VRQ QJM, W2s KHQ IFP, K2s HTX CQP DSL GAS, W3s BFF ONB W4IF, VE1s AEE WL. The net

was continuous until 2142 that night. W1VVA, W1WCC and W1CRW spelled TVJ as NCS at times. Close liaison was maintained with TCPN and the Maritime Net, and much traffic was expedited as a result. Special mention should be made of the fine work done by W1BY, W2JOA, W3WV, W1CRW (who operated from his mobile rig much of the time), W1WCC and VE1XB.

Emergency power units were mighty valuable during the hurricanes, and many AREC units remained on the air simply because they had their own, like the Winthrop organization. That's EC W1BB on the right, and W1AGB standing in the rear.

The New York State 'Phone and Emergency Net was activated at 1800 Sept. 10th and continued through to 1800 Sept. 11th with W2ILI as net control. Approximately 175 net members checked in on the net frequency of 3925 kc. In addition, the New York State Civil Defense Amateur Radio Service was activated and standing by on 3993 kc. with 30 stations ready, and v.h.f. nets on 6 and 2 meters were activated with about 25 members. Links were maintained with Albany and National Red Cross in Washington, also with the Hurricane Net and the New England C.D. Nets.

Damage in Rhode Island was less from Edna than from Carol, but the Cranston Emergency Net was active from 1910 Friday evening until 2155 Saturday at the request of the Red Cross. Net control station W1VXL was activated on 29.52 Mc. and in the 144-Mc. band. Mobiles alerted included W1s BTV LZY YKQ OGY ZBZ OOX and YRY. W1s SGA QLD and VAY called in and stood by during the evening. Mobiles were dismissed but on Saturday morning were called back into action. A fixed station was set up at the Red Cross evacuation center at Edgewood. W1VXL was operated by W1s POP BTV ZPG and OOX, and on two meters by WN1BQB and W1ZGH. W1AFO was operated at police headquarters. W1EWT and W1QOF provided a link with Providence. W1TQW also furnished a fixed link in downtown Providence and monitored the band for other stations and traffic outside the Cranston net frequency. At

the height of the storm all fixed stations operated on emergency power, and mobiles were on patrol duty. Official traffic was handled for the Cranston Police and the Red Cross. Other R. I. amateurs participating in the operation were W1s RUS RVO SGA BBN QLD MIJ JYF and OAV.

The amateurs in Lynn this time were able to do some collective good in their own city by setting up stations in the various firehouses. The frequency of 28,610 kc. was used. Mobile W1s WCB HRA QQL MHK OGG JZV were stationed at firehouses, SHV at Red Cross headquarters, VRK at the Medical Center and VHF at Lynn Hospital. At home rigs were W1s RLO LMJ VUH ZQL UKE YQF TBL DDI JKF VHE CTD and KLC. W1PBQ/m was in contact with Lynnfield civil defense, MCC/m with Salem civil defense and W1JLN/1 net control, operated by JLN and MTG.

In Dedham, W1LYL was again active. At 0820 on September 18th he was instrumental in dispatching mobile equipment from Brookline to New Bedford. Later, he followed the eye of Edna and relayed these reports to the Dedham c.d. office on 2 meters. Losing power at 1515, he operated mobile on 2 meters to report damage throughout Dedham as to road blocks, washouts and other damage.

The first station on the air in Winthrop was W1MQB, who kept an all night vigil on Edna's progress and estimated time of arrival. The net was alerted at 0700 Saturday morning and remained in operation until the danger from Edna was over. The following were also active: W1s DJ CMW OIR OUC HFJ/m BB BDU AGB/m TTH PBX and WN1BOX. Civil defense was prepared for evacuation, and a portable unit manned by W1TTH was ready for this purpose. Officials mobiling about town checking on conditions were kept in touch with the report center by means of WN1BOX/m on two meters. The Winthrop AREC was also able to provide an emergency generator for power for essential parts of the community hospital.

Hurricane Edna hit Haverhill on September 18th, and this time the gang was ready. W1CCF and W1FW were on stand-by at c.d. headquarters starting at 2200 on the 17th, other units coming on the air about 0800 on the 18th and staying in operation until midnight of that date. A unit was again set up at West Newbury, tying into Haverhill c.d. on 147 Mc. Merrimac was tied in on 28 Mc. with W1s HP REI and PIY on the air in that town. W1WTK restored an emergency generator which failed at the hospital. Haverhill operation during Edna was a continuation of its operation from Carol, and EC W1SIX sums up participants as follows: W1s SNZ RLT KBQ CCF SIX FW QYR WTK STA IWR MTS QQD QZS RYV QQG REI HP WNE NAG PIY, W1s ZKB AFM and ZUB.

The Framingham Radio Club Net was alerted Friday morning by W1MHC. The club's generator was set up at W1RXH, who took over as NCS on 28,700 kc. Framingham being headquarters for Mass. Civil Defense Region 3,

liaison was made between Framingham and W1UQW in Worcester on 29,560 kc., contacts being made by W1RXH and W1MEG/m. The following club member stations were activated: W1s RXH WMT/m MHC/m QQW/m MEG/m SQY/m WLJ WPW/m SRG MQU/m and JUL. Operation was terminated Sunday afternoon.

In Hamilton there were three stations active — one mobile, one emergency-powered and one control station: W1s YLQ TIN and LQQ respectively. W1YLQ and W1TIN were active on the Hurricane Net on 3859.

The Braintree gang was again active during Edna. A total of 20 mobiles turned out to patrol the streets, reporting conditions almost as they occurred to the police, street, electric and fire departments. The mobiles assigned to assist the electric company's crews were especially active. W1VTH and W1ZSZ set up a fixed radio station inside the electric plant to act as net control for the repair crews. Many of these operators served around the clock. During the week end seven amateurs with a combined operating time of 41 hours served as net control operators: W1s SSA OSX CTR JOB EKG VTH and ZSZ. The following operated as mobiles: W1s JQA KJD KPX MPT OSX OFO QPH RRP ROB SSA TQQ UXN VMU VBB VTH YMV YYZ ZPI and ZSZ. Others serving in various capacities were W1s AUU IA ISU KWD LZB LJT MMH QVN QPT SAI VYI WNT YKS ZSU ZYG.

The Bedford gang turned out for Edna as they did for Carol, and again assisted the Bedford civil defense in maintaining communication. EC W1RSY showed up at c.d. headquarters at 0600 on Saturday and activated the control station, setting up communication with Brookline, Concord, Hingham and Lynnfield. Later, additional help showed up in the persons of W1s TCG ZSG NAD SAP YFP. Operating home stations were W1s ACE BFV VGC and RSY.

Up in Manchester, N. H., the Hillsborough County Emergency Net went into operation at 1200 on September 11th under net control W1YIH on 29 Mc. The net covered all locations throughout the city to provide communications with c.d. headquarters. The net remained in operation until 1820. Mobiles in action were W1s WUG RGC RYC URL YVN TXN and KYG. Others active were W1s EIQ KYX MSJ QJB QZV RSV TRD VCX WIZ WNB ZHN ALX KEK LEH MFY NCO PDQ PFN PIU QNC RAL RES RIL SLM SSA TYN UYK VBC VEL VIA WAE WNE YKD YXN ZL ZPL. Fixed stations were W1s YHI ZIZ BRY RET QJY YJD WUR and WUU. ZIZ set up his station at c.d. headquarters in the northern sector of the city, and W1WUU set up at Moore General Hospital in Grasmere.

Edna only sideswiped these areas, but the Canadian Maritime Provinces felt her full force. Saturday afternoon, Sept. 11th, found New Brunswick net control VE1PF sending out storm warnings and weather reports. By 1900 the 3750 kc. channel was so congested that the New Brunswick and Nova Scotia groups divided, the

former going to 3740 and the latter to 3770 kc. Yarmouth was the first to feel the brunt of the storm, and shortly after 2100 VE1DW and VE1ACE were the only amateurs being heard from that area, the latter mobile and the former on emergency power. Most of the power was off at Yarmouth, and VE1ACE patrolled the town in his mobile reporting wires down, fallen trees, etc. VE1DW was in contact with VE1FQ at Halifax, which station was also on emergency power. VE1PT was patrolling the Halifax suburbs and passing damage information to VE1FQ. Assisting at VE1FQ were VE1OM and VE1LZ. Skip washed out contact toward morning, despite efforts of W2SAI to help in relaying, but operation was resumed at 0700, by which time the storm had moved to the Gulf of St. Lawrence and other stations in that area were beginning to call in. Main bulk of traffic handled on Sunday consisted of telephone and power line

During Edna, EC W1JLN set up at Fire Alarm headquarters in Lynn, Mass., and acted as NCS for the net on 28,610 kc. Operating was done by W1JLN (seated, rear) and W1MTG. (Photo by Lynn Daily Evening Item)

damage, press releases, weather reports, movements of goods and military. Assisting at VE1FQ on Sunday were VE1s WL HC and LZ. VE3NG assisted in maintaining contact with Toronto. Other stations participating were VE1s NZ/m KK MY FG BW WB ABT ACW MX FM MT SI OC FN RF ED PB BB RL ABP WK PD NA TF VN DF PF ADU and UT.

EDITOR'S NOTE: The second part of this article, the story of amateur radio's participation in Hurricane Hazel, will appear in a future issue of QST.

# Happenings of the Month

## ELECTION RESULTS

Recent balloting in ARRL elections has resulted in the selection of four new directors and three new vice-directors to take office January 1st.

**Harry M. Matthews, W9UQT**, becomes the new director of the Central Division, with 999 votes, defeating Myron Hexter, W9FKC, with 552 votes, Edmond A. Metzger, W9PRN, with 505 votes, and Charles F. Reberg, W9MVZ, with 435 votes. A radio operator and technician with the Illinois State Police at Springfield, "Doc" Matthews has a long history of club work behind him. He has served in all the offices of the Central Illinois Radio Club, and also as president of the Sangamon Valley Radio Club. He organized the Illinois Emergency Net, and has been a director assistant and vice-director. He is an AREC member and PAM.

The new director of the New England Division, **Philip S. Rand, W1DBM**, won handily with a tally of 1636 votes to 490 for Frank L. Baker, W1ALP, and 259 for John L. Thompson, W1BIH. As ARRL Technical Consultant, "Phil" conducted the League's early TVI demonstrations and his work in the field gives him the second name of "Mr. TVI." He received a special citation under the first Edison Award, and was chosen for ARRL's first Merit Award plaque in 1953. He is radio officer for Connecticut Area One C.D., and EC for Fairfield County, and a member of IRE, AREC, and an OPS. Club work includes the founding and first presidency of the Amateur Radio Emergency Corps of Norwalk, Conn., and presidency of the Falmouth (Mass.) Radio Club. He is an electronic engineer at Remington Rand.

A former vice-director and SCM, **Clayton C. Gordon, W1HRC**, becomes the new vice-director of the New England Division with 1617 votes to 745 votes for Ira J. Hemingway, jr., W1HUM. "Clay" has served as vice-president and treasurer of the Providence Radio Association and president and vice-president of the Pittsfield Radio Club. He is employed as a transmission tester in the long lines department of A. T. & T. in Pittsfield, Mass. He holds ORS, OPS and A-1 Operator Club certificates.

With 900 votes, **Walter R. Joos, W6EKM**, nosed out Raymond E. Meyers, W6MLZ, with 860 votes, to become director of the Southwestern Division. Director Joos, a salesman for Johnson, Carvel and Murphy, food products representatives, Los Angeles, just concluded four years as vice-director of his division. His club work includes the past offices of president, vice-president, and secretary of the Inglewood Amateur Radio Club.

For vice-director of the Southwestern Division, **Robert E. Hopper, W6YXU**, polled 1060

votes to the 694 votes of Roger D. Mace, W6RW. Vice-director Hopper is employed at the U. S. Navy Electronics Laboratory, San Diego, as a technician. For the past four years he has been a director assistant. He has served as president of the San Diego Amateur Radio Club, and as Chairman of the Southwestern Division Convention in 1949 and 1952.

**Robert E. Cowan, W5CF**, becomes the new director of the West Gulf Division with 732 votes, defeating incumbent A. David Middleton, W5CA, with 684 votes, and Charles Fermaglich, W5FJF, with 401 votes. W5CF is employed as manager of the Ralston Purina Company's Fort Worth plant, and is active in civic and city governmental work. He is a charter member of the Kilocycle Club of Fort Worth, a member of Air Force MARS, and AREC.

**John F. Skelton, W5MA**, becomes vice-director of the West Gulf Division with 1322 votes to 473 votes for Richard L. Hawkins, W5FEC. W5MA is division manager of the central division of Texas Power and Light Co., and has been a director of the Dallas Amateur Radio Club and chairman of the TVI Committee. He is well known as coauthor of "The Dallas Plan for TVI."

## TECHNICIAN CLASS FILING

As explained in detail in last month's editorial, the Board of Directors of the League has heartily endorsed the FCC proposal to open the 50-Mc. band for the use of Technician Class amateur operators, but has been obliged to oppose the similar opening of 144 Mc. on the grounds it would defeat the original purpose in increasing 6-meter occupancy. The text of the League's filing with the Commission follows:

### FEDERAL COMMUNICATIONS COMMISSION Washington 25, D. C.

In the Matter of Petitions for amendment of Part 12, Rules Governing Amateur Radio Service, concerning Technician Class operator privileges.	}	DOCKET NO. 11157
---	---	------------------

### COMMENTS OF THE AMERICAN RADIO RELAY LEAGUE, INC.

Pursuant to Paragraph 6 of the Notice of Proposed Rule Making in Docket 11157, the American Radio Relay League files these comments on behalf of the more than 45,000 U. S.-licensed amateur radio operators who are members of the League.

These comments were formulated after extensive deliberation by the ARRL Executive Committee and subsequent vote by the elected Board of Directors of the League.

\* \* \*

The League concurs in the proposal to open the 50-Mc. band to amateur licensees of the Technician Class, but opposes the proposal to open the 144-Mc. band for those licensees.

#### *As to 50-Mc. Technician Use*

Some time prior to the release of the present Notice by the Commission, the Executive Committee was in the process of examining an independent proposal received through League channels that the 50-Mc. band be opened to Technician Class licensees. The Committee rendered a report unanimously in favor of such a proposal, which was thereupon confirmed by the Board of Directors. Meanwhile, the Commission released its own proposal. Thus the League heartily endorses that portion of the present Docket which proposes to open the 50-Mc. band to Technician Class licensees.

In this respect the League concurs with the Commission's belief that "greater occupancy of, and experimentation in," the 50-Mc. band is desirable. We believe that the pattern of occupancy of an amateur band, particularly one above 30 Mc., depends to a considerable extent upon beginner interest in such band. Beginner interest above 30 Mc. has in recent years been concentrated in the 144-Mc. band, with little or none shown in 50 Mc. The League believes that it is necessary to take special steps to promote beginner interest in the 50-Mc. band, and urges the adoption by the Commission of this aspect of the proposal.

#### *As to 144-Mc. Technician Use*

With the issuance by the Commission of the present Notice, proposing that Technicians be permitted also on 144 Mc., the League again carefully examined the matter, particularly as to the overall effect of the combined proposals, and both the Executive Committee and the Board of Directors voted in opposition to the proposal. Thus the League is obliged to oppose the proposal to open the 144-Mc. band to Technician Class licensees.

The League's examination of the proposal fails to disclose any compelling reason for its adoption. Occupancy of the 144-Mc. band is not a problem. Since the war this band has had its proportionate share of amateur use. With the opening of a substantial segment of it for use by Novice Class licensees, in 1951, occupancy has increased to more than an adequate level. This band now has suitable beginner interest, which we have stated we believe is so necessary to continued occupancy. Thus we see no immediate need for regulatory action to promote usage of the band.

Nor does the League's examination of the proposal enable it to agree to the argument that its adoption would increase participation in the Radio Amateur Civil Emergency Service. Under RACES rules, station authorizations may not be issued to the holders of Technician Class licensees. Thus adoption of the proposal would not increase the number of stations available for civil defense communication under RACES. The value of the Technician Class licensee to civil defense communications lies, of course, in operator availability. In this respect the League notes it is already provided in RACES rules that Technician Class licensees may obtain authorizations to operate in that service, using designated segments not only to the 50-Mc. band but *any* RACES band segment. Thus the League does not see any specific advantage to civil defense communications by adopting the proposal under discussion.

The League believes that adoption of the proposal would certainly hinder, if not actually negate, the stated aim of obtaining more occupancy also in the 50-Mc. band. Should both bands be opened to Technician Class licensees, in the League's opinion such licensees would congregate on 144 Mc. almost to the exclusion of 50 Mc. This is for the reason that occupancy tends to promote occupancy, and such newcomers would be drawn to the band of greater occupancy. Further, obtaining equipment for the 144-Mc. band is a much simpler problem than for 50-Mc., both in respect to commercially-available units and surplus equipment. The only result would be greatly-increased occupancy of the already-populated 144-Mc. band and little — or, more likely, no — increase in 50-Mc. activity. This would obviously prevent the fulfillment of the objective, common to the Commission and the League, of encouraging greater occupancy of 50 Mc. It is primarily for this reason the League is obliged to oppose the 144-Mc. aspect of the proposal.

Though of lesser importance, the League also comments that adoption of the proposal would appear to make the Technician license rather too attractive. It is the League's view, and one which we believe is also shared by the Commission, that incentives should be provided for amateurs to progress to higher grades of license. In the case of the

Novice, this is adequately handled by the one-year license term. In the case of the Technician, the primary incentive is frequency privileges. In areas where there is extensive v.h.f. activity there are hundreds of newcomers who will be perfectly satisfied with Technician status if they can work on all frequencies from 50 Mc. up. There is a considerable number of amateurs today of Conditional Class, or higher, already devoting their entire time to v.h.f., and perfectly content to do so. They very likely would never have bothered to obtain their present class of license had all the privileges above 50 Mc. been available to them with a Technician authorization.

Summing up, the League believes it to be not in the best interests of the amateur service to open the 144-Mc. band to Technician Class licensees, because there is no valid objective to be accomplished, because such action would negate the desirable objective of populating the 50-Mc. band, and because such action would also have the undesirable effect of removing, to a considerable extent, incentive to progress to a higher grade of license.

## EXAMINATION SCHEDULE

The Federal Communications Commission will give Extra and General Class amateur examinations during the first half of 1955 on the following schedule. Remember this list when you need to know when and where examinations will occur. Where exact dates or places are not shown below, information may be obtained, as the date approaches, from the Engineer-in-Charge of the district. *Even stated dates are tentative and should be verified from the Engineer as the date approaches.* No examinations are given on legal holidays. All examinations begin promptly at 9 A.M. except as noted. (Novice, Technician and Conditional exams are given only by mail. See page 50, May 1954 *QST*, or the *License Manual* for details.)

Albuquerque, N. M.: April 2.  
Amarillo, Texas: March 25.  
Anchorage, Alaska, 53 U. S. Post Office Bldg.: By appointment.  
Atlanta, Georgia, 411 Federal Annex: Tuesday and Friday at 8:30 A.M.  
Baltimore 2, Md., 500 McCawley Bldg.: Monday through Friday. When code test required, between 8:30 A.M. and 9:30 A.M.  
Bakersfield, Calif.: Sometime in May.  
Bangor, Maine: May 18.  
Beaumont, Texas, 329 P. O. Bldg.: Monday through Friday except Thursday only when code test required.  
Billings, Mont.: Sometime in May.  
Birmingham, Ala.: March 8, June 8.  
Boise, Idaho: Sometime in April.  
Boston, Mass., 1600 Customhouse: Wednesday through Friday 9:00 A.M. to 2 P.M.  
Buffalo, N. Y., 328 P. O. Bldg.: Thursday.  
Butte, Mont.: Sometime in May.  
Charleston, W. Va.: Sometime in March and June.  
Chicago, Ill., 826 U. S. Courthouse: Friday.  
Cincinnati, Ohio: Sometime in February and May.  
Cleveland, Ohio: Sometime in March and June.  
Columbus, Ohio: Sometime in January and April.  
Corpus Christi, Texas: March 10, June 9.  
Dallas, Texas, 500 U. S. Terminal Annex Bldg.: Monday through Friday, except Tuesday only when code test required.  
Davenport, Iowa: Sometime in January and April.  
Denver, Colo., 521 New Customhouse: 1st and 2nd Thursdays, 8 A.M.

## V.H.F. BURSTS

Thayer School of Eng.  
Dartmouth College  
Hanover, N. H.

Editor, *QST*:

I don't know whether or not you have heard from Dr. deBettencourt, but Edward P. Tilton's paper, "1000-Mile Burst Reception on 144 Mc. by Radio Amateurs," was duly presented at the XIth General Assembly of URSI at the Hague. Sir Edward Appleton, president of International Commission III, was chairman of the session in which the presentation was made, and he said that all of the bursts looked like meteors to him. Dr. G. Millington of Marconi's Wireless Company presented Mr. G. A. Isted's work on the correlation of v.h.f. bursts with lightning strokes, and suggested that some of the longer bursts on the tape might be this phenomenon. I mentioned that you were already on the trail of this matter and Appleton was most impressed with the fact that amateurs in the United States would be aware of such recent work. He asked that the Commission's highest commitments be conveyed to W4JHK, to W2UK, and to W1HDQ for such high caliber work being carried out by amateurs.

— *Millet G. Morgan, W1HDA*

## RTTY ELECTION RETURNS

WNYC/WNYC-FM  
New York, N. Y.

Editor, *QST*:

I wish to express my thanks for the fine work done by all concerned in transmitting by amateur radio the election returns for broadcast by the Municipal Broadcasting System.

The information collected and forwarded (by John Williams, W2BFD, and his fellow operators) was received at a central point in Manhattan and relayed from there by amateur radioteletype directly into the studio from which the broadcast originated.

Due to their good work, we were able to disseminate these returns about two hours ahead of commercial services.

It is jobs like this, well done, which bring to public attention the accomplishment of amateur radio.

— *Seymour N. Siegel, Director*

## FAMILY CIRCLE

8157 Harper Ave.  
Chicago 19, Ill.

Editor, *QST*:

Bet you are getting quite a chuckle out of the feud between the various groups whose interests seem to be at variance with each other. I've wondered, reading the letters, if it has ever occurred to each group how interdependent we are on each other, really.

To those who love to build gear is due the credit for much of our technical advancement, but if it weren't for those who love to operate, what good would advancement be? If no one wanted to operate, except to test, what use could be found for new circuits and equipment?

The ones who prefer net operation to free-lancing make possible the traffic handling which has been a major item in the justification of our amateur service. However, if it weren't for the free-lancers, no one would have developed the VFO.

If the bands hadn't been crowded, no one would have bothered to figure out the crystal filter, and if no one had been interested in "just operating" there would have been no one to use it.

If everyone built their gear and no one bought it, we would not have the advantage of manufacturers' research, and that is certainly nothing to be sneezed at. You don't

sneer at the man who drives a Cadillac just because he didn't build a homemade car and use it instead.

The boys who brag about their design abilities seem to forget that radio has already been invented, and they are largely making improvements in design rather than originalations, while the operators who razz the builders forget that their gear is the outcome of builders' ideas.

And so it goes, all through the picture. Each would be a total loss without the other. The boys who knock c.w. should try to handle traffic through heavy QRN and QRM, while those who knock 'phone should consider how it expedites the exchange of intelligence when conditions are right. One could go on and on, but this gives you the idea. We're really just one family!

— *Ralph C. Cole, W9LCC*

## V.H.F. FOR C.D.

9330 TSU Ord., Det. B  
Redstone Arsenal  
Huntsville, Ala.

Editor, *QST*:

After each and every situation where emergency traffic is handled by amateurs I read the comments and complaints about stations failing to clear the emergency net frequencies and interfering with communications in general.

Here again is the time to consider the further exploitation of v.h.f. bands for practically all emergency communications. The state of the art has progressed to the point where the reliability and range of v.h.f. equipment even exceeds that of the lower-frequency units of equivalent power under most conditions. In the original organization of many nets, emphasis was placed on the use of existing equipment among the members. This fact dictated the use of the so-called "popular bands." As time progresses it becomes more important to turn attention to more effective equipment designed with civil defense, etc., specifically in mind for more permanent installations. This to me means v.h.f.

— *Rutherford L. Ellis, Jr., W4LNG*

## DX MANNERS

1414 Oakley St.  
Orlando, Fla.

Editor, *QST*:

Oh, what lousy manners 20-meter DX hounds have. Why can't these gentlemen stop frothing at the mouth and wait? To hear some of them you'd think that the only way they will ever be satisfied to QSO a foreigner is to break up his QSO with someone else.

As a victim of the DX hunter's cunning, I speak! How many good ones have been snatched from my trembling grasp by some scheming American? Ouch, boys, pleez. You can wait!

— *Arthur M. Hale, W4TVQ*

## HAWAIIAN PARADISE

P. O. Box 1748  
Lihue, Kauai

Editor, *QST*:

In conversing with U. S. hams plagued with TVI and BCI, they frequently have expressed their desire to be in some place like Hawaii.

Far from being a dreamy South Pacific isle, Hawaii has 13 standard broadcast stations, 3 TV stations, and 3 f.m. stations, not to mention high-powered communications facilities by the major communications companies, CAA, Army, Navy, and electronic navigational facilities serving the entire Pacific.

So, you see, it is not all hula girls and pineapples in Hawaii.

— *K. Nose, K116J*

# YL NEWS and VIEWS

BY ELEANOR WILSON,\* W1QON

## Well-Groomed YLs

Look to your dressing table . . . your manicure set is more valuable than you may realize!

In the General Electric Company's service publication, "Techni-Talk," radio serviceman L. A. Frankel of Astoria, N. Y., reveals that milady's manicure set can serve as a tool kit in the field of radio repair. A filed-down orange stick makes a good nonconductive screwdriver. Emery boards and nail files can clean connections to be soldered. Use nail polish for color-coding or cement, nail polish remover as a plastics solvent. Nail clippers can cut and strip small wires, and tweezers can pick up tiny parts dropped inside the set or hold small parts in place for work within cramped confines.

Wonder what useful purpose false fingernails would serve?

## 'XYL' or 'MYL'?

Wives of thirteen members of the East Bay Radio Club (Oakland, Calif.) have protested the use of the term "XYL." They suggest that unlicensed wives of hams be referred to as "MYLs"—married young ladies. This renews an unsettled discussion scanned in this department several times previously.

The complications are increasing, though. "MYL" is the term most frequently offered as a substitute for the popular but inappropriate epithet "XYL"—both terms denoting the unlicensed wife of a male amateur. However, if we consider the merit of W1YN's suggestions as given in the January, '54, column, an "MYL" would be a married female amateur with license. (Betty's complete offering: "YL"—single woman with license; "MYL"—married woman with license; "SYL"—single woman without license; "XYL"—married woman without license.)

What will be the fate of our time-honored "YL" and "XYL"? Let's hear from interested parties and find out.

\*YL Editor, QST. Please send all contributions to W1QON's home address: 318 Fisher St., Walpole, Mass.

Last October, 18 YLs from six states braved some nippy weather to carry out picnic plans at Big Meadows on Skyline Drive, Virginia. The girls are members of the YLRL net conducted by W4HLE, Arlie, which meets Tuesdays on 3900 kc. at 0800 EST. (L. to r., top row): W4BQI, W4DBP, W4AJV, W3YWK, W3QQF, W4WJX, W4TVO, W3MSU, W4KYI; (seated) W3RNJ, W4RIG, W1UKR, W4HLE, W1VOS, W3TYC, W4YYJ, W4BLR and W3TSC also attended.

January 1955

When Captain "Stay-put," W2XMM/MM, of *Flying Enterprise* fame (see p. 36, March 1952 QST) is on the high seas, it's nice to have the home station in operation. Captain Kurt Carlsen's two young daughters, Sonia (left) and Karen, are now KN2IVT and KN2JAT, respectively. (Photo courtesy E. D. Collins)

## 80-Meter C.W. Net

A new 80-meter c.w. net for all YLs is announced by YLRL Vice President W6KER. The net meets Mondays on 3680 kc. at 2100 PST. NCS is W7GLK. The October issue carried the complete schedule of nets listed with the YLRL.

## Keeping Up with the Girls

W1RJY, Esther, is happy to have her long-sought DXCC certificate. . . . W2EEO, Madeline, and OM W2CYK had a nice write-up in an article entitled "W2CYK Calling," which appeared in the August '54 issue of *Hardware Retailers*. . . . W1YYM, Ellen, finds it pays to start the day early. At 0530 EDT one morning she greeted VK1AC on Macquarie Island, good DX in anyone's log. . . . Allowed the use of a room in the Physics Building at Ohio Wesleyan University where she's a freshman, W8OSD, Virginia, daughter of W8SPC, Helen, operates portable with her Johnson Ranger. So long as high grades are maintained, the physics department doesn't mind the arrangement. . . . W6KER, Gilda, was instrumental in obtaining a pump organ to send to W7ROZ, Father Clem, for one of the churches in his 10,000 sq. miles of territory in King's Canyon, Ariz. . . . Teacher of a number of young girls who earned ham tickets, it was a thrill for W9MGT, Leonore, to have her mother become WN9KJF (Irene). . . . K2CLC, Barbara, has joined MARS along with her dad, K2BWQ. . . . W7OOY, Jeannine, has been appointed chairman of the YLRL Seventh District, replacing W7SBS, who resigned. . . . W5s SYL, Iva, WXY, Bernice, and YKE, Martha, helped relay some 300 messages at the Dallas Fair. . . . W9SEZ, technical instructor and code teacher for the Chicago YLRL Unit, is currently coaching nine students

(Continued on page 136)

# Hints and Kinks

## For the Experimenter

### BETTER AUDIO WITH THE MONITONE

AFTER recent completion of a Monitone, it was discovered that the audio quality was somewhat distorted at normal settings of the receiver gain control. The received signals sounded chopped or clipped at the audio level I prefer to use. This condition was quickly remedied by the substitution of a 6SN7GT for the 6SL7GT recommended for the circuit. No component or wiring changes are required by the new tube.

— Dick Bourne, W1TVJ

### USING A CARPENTER'S BRACE AS A WRENCH

A CARPENTER'S BRACE makes an especially good "wrench" for turning the square-head cap screws used to tighten chassis punches. Frequently, when the corners or other hard-to-get-at places of a chassis are being tackled, it will be found that a brace is a more convenient tool to use than a regular flat wrench. Furthermore, the ratchet feature of the brace will make the job as easy as would be the case were a ratchet-type socket wrench employed.

— Rev. Jos. A. Terstegge, W9LQE

### INEXPENSIVE FEEDER SPREADERS

PLASTIC clothespins, a product of Vermont Plastics, Inc., are available at many variety stores at a cost of approximately three cents each. Easily disassembled, each provides two spreaders for open-wire lines. One hole already exists in the improvised spreader, and the other can be drilled to provide two-inch spacing.

— D. B. Angel, W8DBF

### THREE-BAND OPERATION WITH A 7-MC. GROUND-PLANE ANTENNA

BECAUSE of the growing popularity of the quarter-wave vertical, especially on 7 Mc., it may interest some of the gang to learn that this antenna can be made to do a fair job at 3.5 and 21 Mc. also. The method used to obtain 3-band operation here at W3NWA is shown in Fig. 1.

In the diagram, *L* is a loading coil used when the antenna is operated at 3.5 Mc. When the s.p.d.t. switch, *S*, is in the neutral position, it connects *L* in series with the radiator and the RG-8/U transmission line. In one of the closed positions the switch shorts the coil, permitting normal 7-Mc. operation of the system. The antenna will also take power at 21 Mc. when the loading coil is shorted out. In the third position,

the switch connects the vertical to the grounded radial support to provide lightning protection.

In the original installation, the Premax whip was adjusted to favor operation at the low end of the 7-Mc. band. The loading coil used to resonate the system at 3550 kc. consists of 22 turns No. 12 enameled, 2½-inch diameter, 4 inches long. The

Fig. 1—Drawing of the base-loading system which permits 3.5-Mc. operation with a 7-Mc. ground-plane antenna.

coil was cut from a 10-inch length of commercial stock which had been temporarily installed intact and then tapped experimentally during the initial stages of testing. A grid-dip meter may be used to help resonate the coil, provided the feed point (the coaxial connector shown in Fig. 1) is connected to the grounded radial support.

A liberal application of Duco cement along the existing support bars for the air-wound coil will provide added strength to the assembly. One coil so treated has been exposed to the weather for an entire winter with no apparent ill effects.

In actual operation at 3.5 Mc., good reports have been received from all over the eastern part of the U. S. A., using 100 watts on c.w. Reports are consistently better than formerly received while using a random-length horizontal wire, probably due in part to the low-angle radiation from the vertical. The s.w.r., while not as low as on 7 Mc. (using the same RG-8/U feeder), is not high enough to cause trouble, provided operation is limited to a 100-ke. band centered on the frequency for which the loading coil has been resonated.

— R. E. Young, W3NWA

8th V.H.F. Sweepstakes, Jan. 8th-9th

ARRL Certificates to Leaders; Gavel to Top Club

THE Eighth Annual V.H.F. Sweepstakes, open to all amateurs who can work 50 Mc. or higher, will offer the v.h.f. enthusiast unparalleled opportunities for new DX records, additional states, and meeting new friends. The contest period starts at 2:00 P.M. your local time, Saturday, January 8th, and continues to midnight, Sunday, January 9th.

Just call "CQ Sweepstakes" on 'phone or "CQ SS" on c.w. to get in touch with other contestants, then exchange SS data as shown elsewhere in this announcement. This information is similar to a message preamble, with the ARRL section (see page six of this QST) substituted for the city and state, and the RS or RST report for the "check."

Make contact with as many stations as possible. (You can rework a station for credit on other v.h.f. bands, so ability to work several bands pays off in score points.) When an exchange of SS "messages" has been completed in both directions, two points may be claimed.

To figure your score, multiply total contact points by the number of different ARRL sections worked. You may use 'phone, m.e.w., or c.w., with results all contributing toward one score.

Certificate awards will go to V.H.F. Sweepstakes top-scorers in each of the 73 ARRL sections from which entries are received. In addition,

a certificate will be given to the top Novice or Technician in each section where at least three such licensees submit valid contest logs.

Clubs, especially, are urged to get their members on the air from their individual stations to compete for the certificates which go to leading club operators. The club whose members accumulate the top aggregate score will also receive a cocobolo gavel with a sterling-silver band engraved with the name of the winner.

Contest reporting forms are now available from the ARRL Communications Department and will be sent free upon request. If you don't use these forms, please follow the log arrangement shown. ARRL welcomes all contest reports to assist in cross-checking and to make complete results in QST possible. Novices and Technicians: be sure to report your totals, large or small, so that the license-class leader in your section will qualify for a certificate.

The 1954 V.H.F. Sweepstakes smashed all v.h.f. activity records before or since, with an unprecedented 610 stations reporting. The SS coming up may well be bigger yet. Why not give your v.h.f. set-up a check? In this one January week end, you'll be able to tell more about how your equipment and antennas are functioning than in months of casual operating. Plan now to take part! (Rules on following page.)

## EXPLANATION OF V.H.F. SS CONTEST EXCHANGES

<i>Send Like Standard Msg. Preamble</i>		<i>NR</i>	<i>Call</i>	<i>CK</i>	<i>Place</i>	<i>Time</i>	<i>Date</i>
Exchanges	Contest numbers 1, 2, 3, etc., a new NR for each station worked		Send your own call	CK (Readability and strength or RST of station worked)	Your ARRL section	Send time of transmitting this NR	Send date of QSO
Purpose (example)	QSO NR tells how you are doing (NR1)		Identification (WIAW)	RS or RST report (589)	See page six for section list (Conn.)	Time and date must fall in contest period (6:55 P.M. Jan. 9)	

### Rules

1) *Eligibility:* Amateur operators in any ARRL section (see page 6) operating at home, or mobile or portable under one call on or above 50 Mc. are invited to take part.

2) *Object:* Participants will attempt to contact as many other stations in as many ARRL sections as possible.

3) *Contest Periods:* The contest starts at 2:00 P.M. your local time, Saturday, Jan. 8, 1955, and ends at midnight, Sunday, Jan. 9, 1955.

4) *Exchanges:* Contest exchanges, including all data shown in the sample, must be transmitted and receipted for as a basis for each scored point.

5) *Scoring:* (a) Contacts count *one point* when the required exchange information has been received and acknowledged, a *second point* when exchange has been completed in both directions.

(b) Final score is obtained by multiplying total contact points by the number of different ARRL sections worked (the number in each of which at least one SS point has been credited).

6) *Conditions for Valid Contact Credit:* (a) Repeat contacts on other bands confirmed by completed exchanges of up to two points per band may be counted for each different station worked. (Example: W1HDQ works WSBFQ on 50 and 144 Mc. for complete exchanges of 2 points on each band; 2 + 2 gives 4 points but only one section multiplier.)

(b) Cross-band work shall not count.

(c) Portable or mobile station operation under one call, from one location only, is permitted.

7) *Awards:* Entries will be classified as single- or multi-operator, a single-operator station being defined as one manned by an amateur who neither receives nor gives assistance to any person during the contest period. Certificates will be awarded in each ARRL section to the top-scoring amateur in the single-operator classification. In addition, a certificate will be awarded to the top Novice or Technician in each ARRL section where at least three such licensees submit valid contest logs. Multioperator work will be grouped separately in the official report of results in *QST*.

When three or more individual club members compete and submit logs naming the club with which they are identified, an ARRL certificate will be issued to the leading club member. When less than three individual logs are received there will be no club award or club mention.

A gravel with an engraved sterling-silver band will be offered the club whose secretary submits the greatest aggregate score, provided such scores are confirmed by receipt at ARRL of the individual contest logs from such members (resident club members only). Claims from federations, radio club councils, or other combinations of radio clubs, will not be accepted. Special memberships granted for contest purposes will not be recognized.

8) *Conditions of Entry:* Each entrant agrees to be bound by the provisions of this announcement, the regulations of his licensing authority, and the decisions of the ARRL Award Committee.

9) *Reporting:* Reports must be postmarked no later than January 24, 1955, to be considered for awards.

## NEW BOOKS

**RCA Receiving Tube Manual, RC-17.** Published by Radio Corporation of America, Harrison, N. J. 300 pages, 8 $\frac{3}{8}$  by 5 $\frac{3}{8}$  inches, paper cover. Price, 60 cents.

Those who have owned preceding editions of the "Receiving Tube Manual" will hardly need more than the word that a new edition is out, since it is an old stand-by. In addition to containing more detailed data on receiving tubes and kinescopes than can be obtained from the conventional tube tables, the new edition continues (with additions) the sections on tube operation, installation and rating information, amplifier and oscillator design, and the resistance-coupled amplifier tables. Some new hi-fi circuits have also been added to the circuit section. Altogether a most useful member of the amateur's library.

**The Oscilloscope at Work,** by A. Haas and R. W. Hallows. Published for *Wireless World* by Liffé & Sons, Ltd., Dorset House, Stamford Street, London, S.E.1. 171 pages, including index, 5 $\frac{3}{4}$  by 8 $\frac{3}{4}$ , cloth cover. Price, 15s. 0d.

How the oscilloscope functions, and how to use it in making measurements. Over 200 patterns photographed from the c.r. tube screen, with interpretations. Also contains a chapter on shooting trouble in the 'scope itself, and one on auxiliary devices such as probes and the electronic switch.

**Radio Troubleshooting Guidebook, Vol. 1,** by John F. Rider and J. Richard Johnson. Published by John F. Rider Publisher, Inc. 156 pages, including index. 5 $\frac{3}{8}$  by 8 $\frac{1}{4}$ , paper cover. Illustrations. Price, \$2.40.

A general treatment of the subject, divided into three parts. Part I covers the operating principles of superheterodyne receivers for both a.m. and f.m.. Part II the fundamentals of trouble-shooting, and Part III the most common symptoms and remedies.

**The Oscilloscope,** by George Zwick, published by Gernsback Publications, Inc., 25 West Broadway, New York 7, N. Y. 192 pages, including index, 5 $\frac{1}{2}$  by 8 $\frac{1}{2}$ , paper cover. Price, \$2.25.

For the service technician, principles of 'scope tubes, oscilloscope circuits, and accessories. Covers use of the oscilloscope in servicing TV receivers.

CONDUCTED BY EDWARD P. TILTON, W1HDQ

WE'RE indebted to W6BCX for bringing the idea back into focus. During a visit with him and W6VR, Woody dug into his *QST* file and came up with the July, 1928, issue. Did I remember the "Warner Splatter System" offered to a waiting world by the late K. B. Warner on the editorial page of that issue of more than 25 years ago? The idea was to spray large amounts of r.f. at the ionosphere; if you throw enough stuff up there some of it is bound to come back down again — "just as a firehose, with its nozzle directed at the ceiling would provide a sure-fire way of wetting every square inch of the floor in jig time."

KBW was always coming up with something like that; concepts that had everyone laughing at the time, but somehow had a way of proving out years later. He was talking of 10-meter DX then, but he'd be vastly amused to find what is essentially his splatter system in use today, providing consistent communication in the v.h.f. range over distances of 1000 miles or more. And making v.h.f. work possible from locations where no ham in his right mind would have tried 50 Mc. or higher bands even a few years ago.

It is just such "scattering from irregularities in the ionosphere, when other forms of ionospheric transmission are absent"<sup>1</sup> that is now assumed to be responsible for the success of the well-known Cedar Rapids to Washington experiment on 49.8 Mc. and higher frequencies. And a very similar kind of scattering, ionospheric and tropospheric, is being used by some of our best 2-meter stations in working consistently over distances up to 500 miles or so.

The beauty of all this is that, since an elevated scattering medium is involved, the location of the v.h.f. station is relatively unimportant. If the normal radiation pattern of your array clears obstructions in the immediate vicinity of your antenna, you may do just as well in this kind of v.h.f. DX as the fellow on the top of a hill. A high hill is still nice to have, but it is by no means necessary for successful v.h.f. work.

But suppose you're a valley dweller; you look out from your shack window to snow-capped mountain peaks in every direction. What chance is there for a v.h.f. man in such a spot? Well, don't give up until you've given it a good try; you may find that you have a really good location. No, don't send for the men in the white coats; it can be that way. Your snug valley may turn out to be better than a spot out on the open plains!

We've mentioned "knife-edge refraction" in

these pages before, but our recent swing through much of our really high mountain country showed that few v.h.f. men (present or potential) in these areas have given much thought to the application of the theory to their particular set of circumstances. Yet it has been demonstrated that a sharp ridge at just the right point between two low-lying v.h.f. stations can provide enough refraction to bring the signal level up *more than 70 db.* above the value that would be obtained over the same distance in open terrain!

Few hams are likely to be fortunate enough to achieve any such "obstacle gain" but again and again in our mobile work in the western mountains we saw knife-edge refraction at work. In several instances we had strong signals over mountainous paths of greater length than we've ever worked over rolling New England or the flat Middle West. And of course the 2-meter work between Arizona stations and others at distances of 350 miles or more, recently reported in these pages, is further proof that high mountains are, at least, no certain barrier.

Add to these factors the still newer possibility of v.h.f. DX by reflection from meteor trails, now being exploited by W4HHK, W2UK and others, and the tropospheric and auroral phenomena we've known about for years, and you have rather convincing evidence that v.h.f. *can* be fun just about anywhere. Are you getting in on it?

Don't jump to the conclusion, from what we've been saying, that all you need is a 522 and a folded dipole to work 400 miles over the mountains on 144 Mc. It's not that simple, by any means, or we'd have been doing it long ago. The signals you get over long indirect paths are likely to be very weak at best; you'll need plenty of power, a good big antenna, and the best available receiver to turn the trick. Highly selective receivers and c.w. techniques are a must, at least at first. If you've tried a tough path and failed, with anything less than a combination of all these assets, you can't say that it can't be done. Working long hauls over high mountains is a job to separate the men from the boys. Give it all you've got, and the chances are you'll be pleased with the results!

#### OES Notes

W2RHQ, Syracuse, N. Y. — Now on 432 Mc. with 2C39 grounded-grid amplifier, driven by an 832A tripler. Would like to hear from anyone with dope on gear for 1215 Mc. Recently got 32-element 144-Mc. array working properly by bringing two 16-element sections closer together. With the original arrangement (sections a half wave apart between element ends) there was a split forward lobe. Now hearing W2UK, W3BGT and other distant stations off the backs of

<sup>1</sup>N.B.S. Technical Report No. 1682, August, 1952.

their beams fairly regularly; wish stations in New Jersey and Pennsylvania would aim toward central New York State more often.

**W2UTH, Victor, N. Y.** — Back in business in new location after extensive damage to house and antennas by Hurricane Hazel. Activity on 220 Mc. developing in Rochester area with W2s POM RTB MHU UXP and K2CEH on.

**W3UQJ, York, Pa.** — Would like to hear as to results from anyone who has tried 220-Mc. mobile. Suggest more use of c.w. on 220, as contacts have been made. As result of many skeds with W3LZD, W3SJB, W3UJG and W4UMF, it has been found that anytime a readable signal is heard on 144, 220 is just about equally good.

**W4FLW, Dresden, Tenn.** — Gradually developing more activity on 50 and 144 Mc. Working W4CYR, Nashville, and W4HFO, Martin, on 6 and W4BQG, McKenzie, on 2.

**W4HHK, Collierville, Tenn.** — Daily skeds continue with W2UK and W1HDQ. Burst count on W2UK runs as high as 79 for his 10-minute tape transmission at 0640 CST. W1HDQ heard fairly regularly, but with lower burst count, on 5-minute transmission at 0635 CST. Similar meteor-scatter skeds with W5VWU, Albuquerque, N. Mex., 960 miles, have produced only unidentifiable pings, though W5VWU copied complete call sequence on one occasion. Tests also being made with W7VMP, Phoenix, Ariz., 1300 miles, but no identifiable sigs either way as yet.

Revamped crystal-controlled converter recently, putting in overtone crystal on 45.667 Mc. Enough frequency variation is possible in tuning the oscillator plate circuit so that it can be set exactly on frequency, multiplying to 137 Mc. Now the communications receiver dial reads exactly 7000 kc. for 144 Mc., a real aid in keeping weak-signal skeds.

**W5GLX, Baton Rouge, La.** — New Orleans and Jackson, Miss., always reliable on 144 Mc. W4UUF, Pensacola, Fla., W4TLV, Demopolis, and W4OZK, Gadsden, Ala., also heard frequently.

**W6ORS, Alhambra, Calif.** — Working on 220-Mc. crystal-controlled converter. Rig for 220 Mc. (Feb., '54, QST) working nicely.

**W6ZDO, Canoga Park, Calif.** — Daily operation on 220.9 and 221.1 Mc.; conditions much like 112 and 56 Mc. of many years ago, even to superregen receiver QRM! Converted 1350-Mc. radioonde to 1215-Mc. band.

**W7JHX, Port Orchard, Wash.** — Made first TV transmission Oct. 18th. Put rig on following evening and left it running while away from home. Main power transformer shorted, causing much smoke and excitement. Everything repaired within a few days, and can now transmit video on 44.36 Mc. any evening and Sundays by appointment. Can usually be reached on 2 meters, or through Puget Sound Net.

**W9KLR, Rensselaer, Ind.** — Here's a fellow who must hold some kind of record: W9JNZ, on the air three times since he was licensed, made 20 contacts in 15 states and 6 call areas on 144 Mc.!

**VE7FJ, New Westminster, B. C.** — Much talk, by W7s, of going horizontal on 144 Mc. VE7s, always in favor of horizontal, will welcome change.

**V06U and W7SNR/V06, Goose Bay, Labrador** — Local activity on 50, 144 and 220 Mc. These fellows should have a fine opportunity to make v.h.f. history, if they watch conditions closely for chances to work down the Atlantic Seaboard and elsewhere.

## C.W. Reception with the Communicator

Use of c.w. on 144 Mc. is increasing all the time, and probably would have progressed further if there were some (Continued on page 134)

With this 24-element array, W7LHL/7, Bolan Peak, in southern Oregon, worked the Northwest's best 2-meter DX in the September V.H.F. Party.

# September V.H.F. Party Results

## *Increased Western Activity Nets Record Number of Logs*

WE MAY never be able to set up any wholly fair system for scoring v.h.f. contests, or any other operating activity, on a national scale, but the disparity between various sections of the country is dropping with every v.h.f. party. Of course, a "national high" is only a mythical honor, anyway, as there is competition only within your own ARRL section, but it is interesting to look through the tabulation at the end of this report and see where the really high scores were made.

Of the geographically small and densely populated ARRL sections along the Eastern Seaboard, only Northern and Southern New Jersey, Western Massachusetts, New Hampshire and Connecticut reported September V.H.F. Party totals higher than the 2095 points piled up in the East Bay Section by K6GWE, Berkeley, Calif. Five eastern sections, supposedly cinches for high spots in a national ranking, were topped by Illinois, Ohio, Michigan, Santa Clara Valley, East Bay and Los Angeles.

Ignoring the section multiplier, an unfair factor in national comparisons, we find that the number of contacts made is becoming more uniform, the country over, with every contest. In only two ARRL sections, Northern New Jersey and Los Angeles, were more than 200 contacts reported. In the bracket between 150 and 200, we find Illinois, Ohio, Western Massachusetts and New Hampshire. Of the sections reporting 100 to 150 contacts, Indiana, Michigan, Santa Clara Valley and East Bay are outside the "favored" Atlantic Seaboard states. The country's highest one-band score was made, not by an East Coast station, but by W8WXV, Shiloh, Ohio, who worked 196 stations in 17 sections, 3332 points, on 144 Mc. alone.

The ability to work several bands is the most important factor in high scoring, in any section. The rules were set up with that in mind: to promote versatility and encourage the use of our higher bands. Working all bands from 50 to 1215 Mc. enabled K2CMB, Paterson, N. J., to make 280 contacts for 8456 points, the country's high for a single-operator set-up. The 230 contacts of W6WSQ, Pasadena, Calif., made on 50, 144 and 420 Mc., is second in number of QSOs. Lee Waite, W2FBZ, a frequent Northern New Jersey winner, worked 4 bands for 206 contacts and 7488 points, running K2CMB a close second for single-operator high.

Mountain expeditions, as always in spring and fall parties, contributed greatly to the success of the contest. For once, the W1MHL/1 team came off second best. A combination new to v.h.f. contests but with long Field Day experience, W2GSA/2, Garden State Amateur Radio Association, nosed out the Waltham

group, with 327 contacts on 50, 144 and 220 Mc., for 9715 points. Some nice 2-meter DX was worked in the Northwest by mountain portables. W7PVZ/7 in a fire lookout on Capitol Peak, near Olympia, Wash., worked W7LHL/7 on Bolan Peak in Southern Oregon, about 350 miles. An indication of the growth of 2-meter interest in that region: W7PVZ/7 worked 83 different stations on 144 Mc.

The 1215-Mc. band loomed as a v.h.f. contest factor of some proportions. As the result

Sixty-four element beam atop a 100-foot tower — W8WXV, Shiloh, Ohio, country's top one-band scorer. Al worked 196 stations on 144 Mc.

of cooperative effort by K2CMI, K2DFS and W3UQB, five nearly identical 1215-Mc. stations were built. These used 2C39 cavity oscillators, delivering about 12 watts output. Tuned-cavity crystal mixers with 144-Mc. output worked into Gonset Communicators as tunable i.f.'s. Duplicate corner-reflector arrays were used for transmission and reception. The rigs were used by W1JRV/1 at Mead Pond, just over the line in Connecticut, W3UQB/2 at Balanced Rock, Nyack, N. Y., K2DFS, at his home in Bergenfield, N. J., and K2CMI/2 and W2FSN/2 in Manhattan high spots, to give K2CMB five contacts in four ARRL sections on 1215 Mc.

Around San Francisco there was enough doing

on 144 Mc. so that W6TDP made 56 contacts with 5 watts input to a 5763 doubler (rig built from W2HHW's description in February, 1954, *QST*), and a cut-down TV Yagi hung in his basement!

Two 0-0-0 scores don't appear in the tabulation, but they represent effort and good intentions. One goes to W7RCC, Panguitch, Utah, who was in there trying, but heard no signals. The other was earned by W1HDQ/0. Your conductor got up before 0600 Sunday morning and drove out from the Dakota Division Convention Headquarters in Rapid City, S. D., to a fine clear spot in the Black Hills. Having been in every v.h.f. contest since the first one in 1939, he was going to give this one the "college try," but he didn't reckon with the effects of the bright South Dakota sun. With the car parked, windows closed, all the previous day, the crystal mike just couldn't take it. Having no provision for keying the rig or copying c.w., on the mobile receiver, W1HDQ/0 folded his beam and silently stole back to Rapid City.

In the following tabulation, scores are listed by ARRL Divisions and Sections. Unless otherwise noted, the top scorer in each section receives a certificate award. Columns indicate the final score, the number of contacts, the section multiplier, and the bands used. A represents 50 Mc.; B, 144 Mc.; C, 220 Mc.; D, 420 Mc.; and E, 1215 Mc. Multiple-operator stations, with calls of participating operators, are shown at the end of each section tabulation.

## CALLING ALL NOVICES: CQ N-R!

The Novice Round-up makes its fourth annual appearance this year, January 8th through 23rd. Old-timers are invited to join in the fun and give the newcomers contacts.

Full details appeared in December *QST*, but as a reminder, don't forget that the Round-up starts on Saturday, January 8th, at 6:00 p.m., local time, and ends on Sunday, January 23rd, 9:00 p.m. local time. A time limit of forty hours is available. This can be used any way you prefer in operation on 80, 40, 15 and 2 meters.

You've still time to get extra scoring credits by qualifying in the Code Proficiency Run from W1AW on January 14th, or from W6OWP on January 7th. In the meantime, send to ARRL Headquarters for your free map of the United States, a contest log, and reporting forms for the Novice Round-up. The fine outline map can be posted in your shack to keep a visual check on your worked-all-states progress.

Remember to read December *QST* again for full details on rules.

# A.R.R.L. COUNTRIES LIST • Official List for ARRL DX Contest and the Postwar DXCC

AC3.....	Sikkim	KC6.....	Western Caroline Islands	VP5.....	Turks & Caicos Islands
AC4.....	Tibet	KG4.....	Guantanamo Bay	VP6.....	Barbados
AP.....	Pakistan	KG6.....	Mariana Islands	VP7.....	Bahama Islands

CONDUCTED BY ROD NEWKIRK,\* W9BRD

## Why:

Well — 1955. A new DX year coming up!

We've instructed Jeeves to go out and pin down the reasons for all the wide smiles of high DX morale prevalent at this writing. Here's what the ear-tufted gentleman uncovered in the line of facts, ma'am, DX blessings that are no sorrow to comprehend:

... The propagational worm has turned and conditions on our higher-frequency DX bands are on a slow but sure mend. About time!

... Fifteen meters, our newest DX band of vast potentialities, is about to come into its own. If any band has a chance to unseat Old Pro Twenty as the DX band, 21 Mc. is it. Indeed, counting 11 meters, it won't be long before we have four DX bands simultaneously capable of producing rare daylight DX.

... There are more ARRL DXCC Countries List items readily workable than ever before, this despite the general absence of U-prefixed stations. Increasing traffic at W1WPO's Hq. DXCC desk reflects this and you'll be able to prove it for yourself next month in the annual ARRL DX Competition. QRV?

... Liberalization of amateur regulations in several overseas countries during 1954 now is evident in the increasing number of formerly rare prefixes heard on DX bands. Austrian, Japanese and Philippine nationals particularly benefited. The sluggish ITU "ban" list which originally included over a dozen countries now is whittled down to French Indo-China, Indonesia, Iran, Korea and Thailand.

... TVI terrors continue to wane. Guys who surrendered to the one-eyed monsters a couple of years ago now are back on the air with modern single-frequency-output rigs, working DX and grousing about another nuisance — ITV.

... Single-sideband DX in 1955 no longer is just around the corner. It's here. Flip your receiver on and you'll hear DXers eagerly putting s.s.b. to work on long-haul A3 paths, a facet of the game attracting converts and exponents daily.

... A relatively new DX-hunting gimmick is creating much interest and finding wide acceptance: the "midget" rotary beam. Thoroughly propounded in 1954 QSTs, these miniature squinters have given cliff dwellers a better chance to slug it out with the antenna-farm lads, and have made 7-Mc. rotaries highly practicable.

That's enough detail to go into in our limited space. And there you are, as George Gobel puts it. You need no rose-tinted specs to diagnose the 1955 DX world sound, substantial, and rarin' to go. And, as usual, your monthly chunk of QST is rarin' to record your 1955 reports and contributions — band by band, QTH by QTH, continent by continent, photo by photo and cliché by cliché. Like this, for instance. . . .

## What:

Fifteen, as we were saying, is coming along nicely. W7AHX radiotelephoned with a wide selection of stuff including CX3BH, EL2X, HC2JR, KA8AB, KC6AA,

\* New Mailing Address: Effective immediately, please mail all reports of DX activity to DX Editor Newkirk's new address: 5833 North Kenmore Ave., Chicago 40, Illinois.

KG6GX, KJ6AZ, OQ5RU and ZB2A. . . . CN8MM, ZC4JA, ZS3s BC and E came back to K2CHS on voice. . . . HC3s 1MB 2PG and VK9DB top W5QXX's lengthy A3 list. . . . W6ZZ caught up with voicers DU7SV, HK3FV, JA4BB, KW6s AT BB, VP3YG, a VP8 and unusual XE5PD. . . . Ws 1JLN 1MGP and 4YQB catch their share of the goodies, W1MGP with a mere 3-watt mobile outfit. . . . Newark News Radio Club logged 21-Mc. 'phone candidates CP5EK, CT3AN, EA9s AR AS, ELs 3A 12A, TA3AA, SV0WK, VQs 2DT 4EZ 4RF 5BVF, ZB1s AUV BO, ZEs 2KR 5JJ, ZS3B, 4X4s BC and BL. . . . Fifteen c.w. is equally productive and ZD6BX recommends FY7YC, HZ1HZ, SU1XZ, Y12AM, YVs 1AD 5AE and ZD2DCP. . . . W2ESO stalks code men ZSs 7D and 9I; Ws 1CTW and 8DAW nabbed ZD6BX (73) 14 EST. . . . DU7SV, LU1ZT, PJ2AA, TI2BX, YV5BJ and ZE5JJ swapped c.w. with W7AHX. . . . KP4KD reached 83 15-meter c.w. countries by way of an FY7, OE5JK, TF3MB (80) 17 GMT and a ZD6.

Twenty 'phone reels with goodies and K2CJN made off with CR4AL (125) 16 EST, FF8AP, LX1DU (148) 9, ST2NW 16, VQs 2DT 3RJB, ZD4BR and 3V8BB, VQ5DES, YO3CM, 4S7LM, 4X4DK and a ZD3 escaped. . . . VPs 1GG and 7NS (190) 15 EST worked VE5HR. . . . ET2XX (198), OD5AB and TA3AA will ship QSLs to W7AHX. . . . W5KUC and the 200-DXC boys drew beads on scrumptious FY7YE (185) 0, LH2P (145) 6-8 of Svalbard, VQ8CB, VS4HK (100-200) who moves to VS5, YK1AE (148) 14, ZC3AC, 4S7s FG (110) 18, YL (105) 18 and 9S4AP (190) 15, all times GMT. . . . The West Gulf DX Bulletin, W5s ALA and FXN prime movers, has these 20-meter 'phone items under surveillance: AC3PT (102) 13 GMT, GD2FRV (172) 14, M1CP (95) 14, YA2KB (108) 14, ZD3BFC (107) 19 and 4S7YL (107) 13. . . . So, Calif. DX Club's Bulletin lists 'phones CR6BX (158) 14, CS3AC (195) 17, FE8AC, FM7WN (160) 8, FO8s AB (113) 10, AD (150), AG (197) 22, OQ5FO (125) 14, VSs 1FK (47) 9, 1MK (146) 8, 2DS (96) 9, ZC7DO, ZDs 4BL (100) 14-15, 9AB (150) 6, ZM6s AL (183) 19-20, AT (161-182) 18-22, 4S7BR (105) 7, 5As 2TZ (150) 17, 3TE (110) 11 and 4TR (150) 11, times PST. . . . NNRC sources tagged 14-Mc. A3ers CR6AC, CT2AG, DUs 1AP 1AS 9JY 8 EST, EA6s 6QS 9AR 14, 0AC (150) 16, EL2X 14-15, FM7WF (172), FQ8AK 15, GCs 3EBK (100)

Though relatively a newcomer to DX ranks, DUICV of Laguna, Luzon, P. I., has done more than his share to make the Philippines available on several DX bands. Vil runs 250 watts of 'phone or c.w. (Photo via DU7ST)

17, SMF (135) 17, GD3IBQ, HISWF, HZIAB, JA7BN, KC6AA, KM6AX, KR6KS (180), KT1s LU PU WX (185), KW6BB, KX6s AF NA, OD5s AJ AP BA LC, OQ5s CX ER 13, OX3ZO, PIJ in Holland, ST2NW 16, TAs 2EFA 3AA, TG9s BG BH, VK9s BS 8, RG 7, VG YT, VPs 1AB (160), 2DA (155) 2DL 7NG 7NT 7NU 8AA (143) 20, VQs 4ERR 4EU 4EZ (149) 14, 4RF (130) 16, VR3A 7, VSs 1FE 2BS 2DB 2DQ 2DY 2EB, YN1LB (110), YO3RL 17, YSs 1MS 1O2AC, YU1s AD CY GM (148) 12, ZBs 1A1X (173), 2A (125), ZP5s CF CG, 4X4s DR 16, ED, 5As 3TC 4TN and 4TU (120-145) 15.

Twenty c.w., night-shy in northern latitudes, remains top banana for the bunch. K2GEF worked DU7SV (Volt really gets around!), HRIMC, LU 2ZC 8ZS of So. Shetlands, VP8AQ (10) 22-23 GMT of So. Orkneys, VU2EJ (40) 2, Y12AM (65) 21, ZC4GF and a KM6s..... W4YHD raised CRs 6CS 7AG (15) 9, EAs 8BK (45) 11, 9DF (55) 11, FQ8AN, GD3IBQ (36) 12, IS1TAW, ST2AR (10) 19, VP2s GW, KB (100) 23, VQs 2AB (20) 19, 4RF, ZE5JA (73) 18, ZS3AH (80) 20, 3V8AN (102) 5, OQ5s CP (15) 22, GU RA (40) 13 and a flock of KA brethren, all times GMT..... FY7YE (61) 17 EST, MP4BBL (87) 11, UB5KAB, VQ8CB (60) 11, VU2FX and ZM6AX chatted with WSDAW..... ZD6BX picked up FB8s BC BN BR NX, SU1CN, VK1PG (14) 15 GMT, VSs 1BJ 1EG 1EW 1FE 1GG 2DF (15) 15, 6CG 6CW 9GV, VU2AN, YO3RF (78) 15, ZC4NA, ZD2DCP, ZS8D, 4S7s KH LB NG NX (66) 15, 4X4s BX DH and DR..... KM6AX (60), VP7NG (10) and VP8AA (15) wound up in W7UAB's ledger..... Nearing the century mark, W1WAI grabbed HA5KBP (71) 18 GMT, IS1AHK (67) 20 and LZ1KAB (81) 17-18..... CNs 2BE 8FQ 8GB, F9QV/FC, an FQs, a GD3, KV4AQ, OQ5s BB BQ, OX3UD, OE13USA, SV1SP, VP7NN, YO3s 3GY 6AW, ZBJJR, ZE5JE and CP4MT answered W3UXX..... CN8FL caught FK8AC, KR6LP (65), KX6BF (50), MP4BBE, VR2AS (30), YN1AA, ZK1AB (35) 6 GMT and 4S7HK.....

Among K2BZT's monumental assemblage we find CR7LU 14 EST, CT3AV (50) 13, FQ8AT 15, FF8AJ 17, HZ1HZ 11, JAs 4AF (69) 18, 6AD (66) 18, 9CA (70) 18 (not two), KAs 2CG 2CR 3SV 9MF, LU9ZM (86) 17, VQ2AB (90) 16, a VQ6, YO3RD, ZE2JC (86) 15, a ZD6 and ZS3T (20) 16. This makes it 129 for Hayden..... Here and there, W2OLU hooked; FM7WP (42) 16 EST, a VP7, W7AHX; CT3AB, EA9AP, ZB1BF, W0VFM: VP6GT (76) 22-23 GMT, W9UKG: FY7YZ (32) 11 CST, CO2SW: CE0AD (18) 23-0 GMT, CR5JB, EA0AB, LUs 1ZT 7ZM, MP4BBL (20) 15, ZD4s AB BK, ZSs 7C 9L, VE5HR: YU2DU (20) 15..... WGDNC 14-Me. c.w. pickings: CP3CA (50) 21, CR6CJ (45) 20, ETs 2PA (62) 23, 3S (55) 19, FK8AO (75) 6, FQ8AG (68) 21, GC4LI (95) 14, OD5BA (65) 14, OY2Z (2) 23-0, VP8BE (57-78) 1-2, VQs 4BNU (38-50) 18-19, 6LQ (67) 14-15, VRs 2AA (30) 3, 3A (63) 3, 2RO (G2RO), ZE3JA (95) 0, ZS3s K (20) G (72-100) 19-20, T (18) 21 and 4X4CK (52) 14, times GMT..... NCDNC offerings: FG7XA (20) 14, FR7ZA (20) 15, GC2FZC (20) 15, HK6AI (71) 15, HZ1AB (79) 15, MP4s QAH (12) 15, QAJ (39) 15-16, SP2KAC (59) 15, SV0WL (51) 15, TA3AA (26) 15-16, UA9KAB (64), VK9RII (72) 5 of Norfolk Isle, VQs 2JN (60) 20, 4EZ (24) 15, VS4HK (47) 16, YO3GY (45) 15, ZB1EB (88) 16, ZC4IP (94) 15, ZD3BFC (40) 20, 4X4s AM (53) 15-16, CK (88) 15-16 and GY (58) 17, all PST..... Noted by SCDNC: C3AR (22) 23 PST, KG6IG (65) 20-21 of Chichi Jima, KJ6AN (40) 18-19, VK1s AC

(20) 22, EG (36) 22-23 of Antartica, and VQ8CE (11) 10 of the Chagos.

Forty c.w. served up EAs 8BF (10) 3 GMT, 9AP (1) 22, 9DF (30) 7 of Rio de Oro, HA5KBA (12) 22, IS1AHK (10) 22, KC6CG (20) 12, KG6GX (30) 12, LU7ZM (24) 3, ST2s AR (2) 0, NG (7) 1, VK1AC (7) 12, ZS3K (30) 5, 4X4s DE (10) 0 and FW (35) 2 to W4YHD..... ZD6BX accounts for JAs 3AA 6HK, VU2BY and 4S7NX on 40; 4S7DJ got away..... W2ESO collected LZ1KAB, an ST2, VK9AU (15) 6 EST, VS9AS, VQ2GW 20, ZL2QN/VQ4 (30) 20, 4X4RE 17; HZ1HZ, OD5AX and other LZ1s were heard..... W6CAE and K6EC nailed down ZD6BX (24-28) 14-15 GMT..... W6LRU worked CE3AG (12) 9 PST, DU7SV (28) 12 and FK8AO (38) 6. Don stalks FB8XX 15 and FR7ZA 15 on the low edge..... 7-Me. c.w. doings at this shack and that shack, at W1APA: LU3ZB, VP6GT, W1H1A: HR1JZ (20) 12 GMT, K2ALA: IT1TAL, HK1TH, TI2PZ, YU3ABC, YV5DE, W3WPG: HA5KBA, OQ5GU, PJ2CE, YS1O, J8DAJF: FG7XA (9) 18 EST, W9UKG: HK6AI (75) 5-6 GMT, LU2ZL, a VP6, CN8FL: AP2K (70), VS6CG (20), DL4ZC: ZE6JJ, KP4KD: VP8AZ (30) 8-9 GMT..... 7-Me. customers CRs 6AC (17) 18-19, 7BC (27) 5 GMT, 7CI (24) 3, HK4EF (20) 20, HR1AA (28) 20, LU7ZO (28) 6, OQ5GU (28) 5, VPs 7NG (23) 5, 8BE (22) 6 and ZS3K (37) 5-6 are recorded by WGDNC..... SCDXC

VR2CD's consistent Fiji signal easily will be recalled by the DX crowd. Chas, is shown here during a stop at ARRL Hq. while recently touring the U. S. A. with his family as VE7ASL/W/mobile. Ultimately, ex-VR2CD plans to settle down in Hawaii to await a future K116 call sign.

cohorts add EL2X (5) 7 PST, FP8AP (40) 18-19, JA1AA (23) 7, VK1RJ (25) 5, VP8AD (12) 0-1, VQ6LQ (30) 7, VS1FE (16) 8, ZMs 6AI (1), 7AL (1) and ZS7D (35) 7.

Forty 'phone, tough as nails, furnished DU7SV and HP3FL for W7AHX..... HC1MB, HK6AI (204) of San Andres, KG4AJ, TE2WLC, VPs 5SC 6FR and YV5AJ used 7-Me. A3 with WIAPA..... NNRC lists 40-meter radiotelephone activity by CP1BG, HP1TS, HR1AT, DU1s 1EC 1GF 6IG 7NO 9JM, dozens of JAs, KC6s AA CG UN, KG6GX, KV4BD, OA2A, many VKs and ZLs, YN4CB, YV5EX, ZS6s BW and DW (85) 23 EST.

Eighty c.w. mainly was featured by the pursuit of ZDs 2DCP (11) and 6BX (99) by the East Coast crew; and DU7SV plus VR3A by the West Coast contingent..... Europeans were the most common commodity and K2BZT found about a dozen Gs, several DLs, Elms 4X 9J, CT1BT, three PA6s, G15UR and OK1KBW available..... Watch for ZD6BX around 3600 ke. between 9 and 10 EST

..... KP4KD went to 'phone to clinch Dominican Republic, HI6TC on 3900 kc.; a fast QSL resulted.

One-sixty c.w. saw many hands preening for this season's transatlantic efforts. TI2BX put a new country on the band; Ws 2EQS 2GGL 3RGQ 8ANO and 9PNE were among his lucky pursuers in late October..... G6GM got across to W1BB and W2EQS; G3PU swapped 1.8-Mc. reports with W1BB..... Quite a few rather rare Africans and Asians have reported 160-meter interest. Depending on conditions, we may see several new top-band "firsts" claimed in 1955.

Ten 'phone and its mercurial openings require quick work. Using his new 10-clement rotary with corner reflector, W4NQM cashed in on 28-Mc. 'phones CE5 2HJ 3CZ, CR6BX, CXs 2CN 3AA 4CS, HCIs MB RT, LU5 3AAT 4AAR 4DJT 7DAA 8FP 9AQ, PYs 2CK 4AS 4EM, TI3LA,

JA6AD has one of the more potent 14-Mc. Asian signals these days and has accounted for over 125 ARRL DXCC List countries since activating in December, 1952. Hiro runs 300 watts to the transmitter at right. (Photo via W1YYM)

VPs 2MY 6WR, VQ2FU, XE1IQ, YVs 3BK 5AB, ZSs 4CX and 6OP..... 28-Mc. A3 luck here and there, at K2AJD: KV4BI, KZ5s, a VP2, W3EDI: HR1AA, W3ESE: LU4AAT, PY4PQ, W3QMG: LU3BQ, a VP2, ZS1KK, W0BJP: CE5GG, CX1GG, PY7HS, ZS4CW..... G3IDG finds ten open for DX on about one day out of four. Allan has heard FAs 3JY 9RZ, LU5 IDJC 3AQ 5DC 9AG 9AW, OQ0RU, PYs IAGP 2AHS, VQs 2NS 4RF, ZD3BFC, ZS6s CV SG WW and ZK. All save FA9RZ were using voice. Other GPs were heard calling or working CN8s, OQ0DZ and ZP stations..... Out west, W6NJU QSOd CE3QJ, CX3AA, KH6PM, LU6AB and a PY2. Who will claim the first 1955 WAC on 28 Mc.?

**Where:**

ARI General Secretary HAXD writes that all Trieste-bound QSLs now can be sent through ARI, Via Paolo 10, Milan, Italy, or by way of IIBLF/Trieste who is ARI's manager for the Territory..... W2FCT has VP3JM's log for the period Sept. 20, 1946, to Oct. 10, 1948. If you still need Andy's QSL, send a stamped self-addressed envelope plus full QSO data to W2FCT's Call Book QTH..... F7BM is another who recently received a UB5CF QSL direct from Odessa. Several other UB5s now answer to the address to follow..... "All QSLs for NE6AM QSOs have been sent and anyone not receiving his please notify W6COH." Stations who worked other Todos Santos XE6s in August and who still need QSLs are also advised

Here's the op and set-up responsible for providing hundreds of Liechtenstein QSOs and many a new country for DXers throughout the world. He's Kurt Bindschedler, HB9MX, active as HIBMX/IE on many 1954 week ends using mostly 15, 20 and 40 meters, 'phone and c.w. The rig is a Collins 310 and the receiver a Philips CR-101. HIBMX/IE has rolled up over eighty ARRL DXCC List countries since last September. (Photo via HE9RZF)

to contact W6COH who will alert the operators concerned..... From W1JDE: "I was formerly TG9FG in Guatemala and worked more than 3000 stations while stationed there. While I QSLd 100 per cent I feel that there are many hams who did not receive my QSL cards because of the poor mail situation there." Send QSO particulars to W1JDE if you still need his TG9FG pasteboard. He has his Guatemala logs and plenty of QSLs..... You must thank W1s APA UED WPO YYM, W2s MLO OLU, W3s SOH UKO WPG, W5KUC, WSDAW, ZC4FB, NNRC, WGDXC and 200-DXC for running down the following addresses:

**Whence:**

Asia — "Activity in ZC4 is on the upward trend again. ZC4GF is concentrating on 160 meters, 50 watts to a half-wave wire; ZC4CK is on 40 meters; ZC4s CA and PB are on 20 and 40; ZC4PB hopes to get on 160 and ZC4CA will have a week or two on top band before packing his sea baggage for the U.K.; ZC4MW is temporarily QRT; ZC4IP is, I believe, on 40, 20 and 15; and ZC4RH is a new one." This from ZC4FB who is giving 20 and 40 a final fling before he heads back toward England..... Don't throw away your old Asian QSLs — JARL (Japan) has under consideration an All-Asia DX award to be avail-

able on a world-wide basis. . . . 487XG goes back to G3HVG after over three years of diligent Ceylon DX work. . . . Oender Tuezualp, Hamamoune Firin Sok No. 16/1, Ankara, Turkey, is a would-be Turkish ham who desires to correspond with W amateurs. He'll soon QSY to the U. S. for schooling. . . . W4TBQ, active since 1935 as WIPEF, W6NQY and KA1AC, expects to replace W6OME as one of TA3AA's 1935 operators. . . . Ex-TA3MP schedules an assault on his Turkey QSL backlog, circumstances ensuing from QSL orders that went astray. Check Meade's present K6EWZ QTH in "Where." TA3s AA, Ankara; US, Izmir; WD, Izmir; and TA2EFA, Ankara, still represent Turkey on ham bands. TA3QN also is in Turkey but for security reasons cannot QSL. . . . The hamshacks of VS6AE, JA8AG and KA2CC were visited in person by W0YDZ/KG6. . . . Recent geopolitical developments may have put a damper on future FN7-FN8 amateur operation. CR8AB continues to represent Portuguese India DX interests on 20 meters.

**Africa** — Illumination of Dark Continent DX doings thanks to ZD6BX: "ZD6EF now is postmaster at Blantyre and is rebuilding; he has a low-power rig on 40 temporarily. VQ5BVF, active on 15 'phone, reports several VQ5s on U.K. leave. VQ5EK is on 20 'phone. FB8BR is a new one in Tananarive with 20 watts on 20 c.w. SU1XZ operates all bands, 160 through 10 meters. ZS91 'is getting some QSLs off soon.' ZS7D continues very active on 40 c.w." As for his own installation, Vic pens: "ZD6BX now is mainly on 15 meters, with occasional forays on other bands." He hopes to rack up some 3.5-Mc. DX this season but b.c. QRM makes it necessary to operate around 3600 kc. ZD6BX's power goes off from 2100 to 0400 GMT, considerably restricting night DX activities. . . . CN8s EG and FL return home to W8s PHX and EZF, respectively, where they're willing to clear up any outstanding QSL matters (see "Where"). . . . AAEM (Morocco) sponsors an interesting DX award based on 30, 25, 20, or 15 CN8-contact QSLs, the requirements depending on one's location. It's called *Diplome de l'AAEM*. For full details write *L'Association des Amateurs Emetteurs du Maroc*, B.P. 2060, Casablanca, Morocco. . . . EA9DF still is bent on 1955 Iñi activity. . . . QSL managers are familiar fellows, bless 'em, but here's a new sign of the times: EL2X and CN8MI act as *QSO managers* for ZD3BFC.

**Oceania** — Hats off to ZK1BG for alert monitoring and quick action in October when he did much to assure the rescue of adventurer Willis and balsa raft *Seven Little Sisters* near Samoa. . . . From the *DXer*: Ex-PK4DA is back in Indonesia for a spell but reports little possibility of ham activity there in the near future. . . . SCDXC advices: VK1HM and ZC2AC are QRT, their silence to be followed by that of ZC2AD who leaves the Cocos next month. Thus ZC2-land joins Christmas Island (ZC3) in the amateurless category; ZC3AB is in Australia and ZC3AA never activated. Don't forget that G2RO plans operation on Cocos around February 6th-8th. FO8AG swapped islands, Makatea for Tahiti, and VK1AC returns to VK3IB. The ex-FO8AJ team is thinking of possible DXpeditioning in the ZM17 area next summer. VR3A looks forward to more 40- and 80-meter work as well as a 1956 visit to California. VR2BZ continues his RNZAF flying visits to VR5, ZM7 and other areas, firing up a rig whenever he has the opportunity. ZM7AL (ZM6AL) is intermittently available on 40's low edge.

**Europe** — IIIVIAA hit the airwaves far behind schedule and QRT'd far ahead of schedule. W4YIID reports that only two contacts were made, both of these on 14-Mc. 'phone (no Ws). . . . F7s BM DH and DZ are hard at work ironing out plans for a more tightly-knit F7 ham

organization replete with hamfests, call book and local nets. Club secretary K2JCS notes that DL2WW (W2FKO), ON4ZI and YU1GM (W4GMP) probably are the only Americans operating ham stations in their respective countries or licensing areas. . . . In the wake of the recent Trieste settlement, AG2s and MF2s go off the air in favor of 11 licensees. MF2AA reports that the Trieste DX award rules now conform to omit reference to AG2 and MF2 prefixes. . . . Contact GW8WJ for info on the Tops C.W. Club, a group of code-hounds with members in 21 countries. . . . In QSO with W8DAW, UB5KAB states that certain U.S.S.R. "collective stations" are authorized to QSO outside the curtain. Finally? Now how about some UIs ULs and UMs.

**South America** — Coöperative LABRE Secretary Flavio Serrano now spots call sign PY1CK. . . . W2OHF was notified by PZ1RM that PZ1AL unfortunately has joined the ranks of Silent Keys. . . . "Chilean transport *Esmeralda* now is on its way to Easter Island and I expect to have at the end of November a copy of CE0AD's log for the communications he has made from the beginning of the year to date," writes CE3AG, ex-CE0AA. Luis then will be able to answer the 300-plus pasteboards RCC has received for CE0AD. CE0AC returned to Chile and will QSL the few contacts he made. Conditions on Easter remain inhospitable to hamming, the main difficulty being lack of generator fuel.

**Hereabouts** — CO2SW breaks a long silence and clews us in on Cuban DX doings. Active DXers down Sergio's way are CN9AA, CO2s BM CT OE OM WD SW, CO7AH, all c.w.; CO2s BL and OZ on 'phone. CO2CT is cranking up a new rotary and kw, while CO2SW rebuilds toward faster bandswitching. Sergio needs tracers on former EPIs C AL, MD5PC and KC6WA, all worked in '47 and '48. . . . September 18th, at Chicago, the annual W9-DXCC meeting drew the attendance of over 40 DX sharpshooters. W9s PNV TRD and ARRL QSL Manager W9CFT headed an entertaining program. W9s ABA ABB AEH AMU DHT ESQ EWC FDX FID FJB FJY FKC GDI GIL GRV HUZ IOD IU JIP JFF JUV KA KXK LI LNM MZP NN PGW QIY RBI RHA RKP RQM TKV UXO UNO WFS WKU and YFV were on hand. W9s FID FKC NN and QIY were elected to the W9-DXCC executive committee for the new year, W9FID as chairman. . . . W6s CAE BZE CHV GBG MGT, K6s DGB and EC invaded W6LRU's abode in early November for a meeting of the San Diego DX Club. Don looks for hints on how to pry QSLs from VK1s AF RL, ZM6AA and 5A2TR. . . . The Fourth Informal Get-together of New England DXCC Members, held at Cambridge, November 4th, saw dozens of DXers enjoy a program featuring W1DX, W1FH and ARRL QSL Manager W1JOJ. Many of the gang could swap tales of antenna damage at the hands of YLs Edna, Carol and Hazel. . . . Ex-IH3DM is QRX at the "Where" QTH for those who still need his QSLs. . . . W0PRM would like lines from hams interested in, and specializing in, QRP DX. . . . W6YY knocked off the NZART (New Zealand) WAP award, the first U. S. A. station to earn it on 'phone. . . . A letter from Hallcrafters Co., Chicago, to W2MLO mentions the possibility of future DXpeditions à la FO8AJ. QRV! . . . W2WC rolled up 173 ARRL DXCC List countries, 117 on 7 Mc., then moved from Brooklyn to become WIWY. . . . W9VND is glad to be ex-W8GTV and is back in DX business just outside Chicago with 100 countries worked in less than four months. . . . The *DXer* mentions possible February T19 activity courtesy W6MHB. Also that W6RRG, now in the Bahamas, may see some ZDS activity. . . . Don't forget the gala joint meeting of the Southern and Northern California DX Clubs scheduled for the 15th and 16th of this month at Hotel Californian in Fresno. All DXers are welcome — waste no time in contacting meeting chairman W6TI for arrangements. . . . OT KP4KD, now over the 200-mark confirmed, could use suggestions toward MP4BAU and VS9AP QSLs.

A veritable European pile-up was snapped at the Yugoslavia International Hamfest held last August in Ljubljana. From left to right are well-known DXers YU1GM (W4GMP), OZ1FM, SV1SP, G2MI, DL1DH and OE5IH. (Photo via YU1AD)

**QST for**

# 21st ARRL International DX Competition

*'Phone: Feb. 11th-13th and Mar. 11th-13th;*

*C.W.: Feb. 25th-27th and Mar. 25th-27th*

**A**MATEURS all over the world are cordially invited to take part in the 21st ARRL International DX Competition, to be held four week ends in February and March. U. S. and Canadian operators will be trying to add to their DX country totals, other stations to work needed states and provinces for their WAS and WAVE awards, and everyone to match operating skill with others in his country or ARRL section.

Two week ends are devoted to c.w. and two to 'phone operation, giving everyone a chance to participate on both 'phone and c.w. "Rest up" periods are provided between week ends.

The rules of the contest are the same as those of last year, with this exception: U. S. and Canadian amateurs will send a signal report plus their state or province (instead of indicating input power). This information is of special interest to overseas stations aiming to fill in states for WAS and provinces for WAVE.

As in the past, certificate awards are offered to the top single-operator 'phone and c.w. scorer in each country and ARRL section. A special category recognizes multiple-operator stations in those sections or countries from which three or more valid multiple-operator entries are received. Within a club, single-operator entries can compete for the club certificate awards given to the highest c.w. and 'phone scorers. A handsome gavel is also offered to the club whose members run up the highest aggregate score.

Stations outside W (K) and VE/VO will call "CQ W/VE" or "CQ TEST" and trade contest exchanges with U. S. and Canadian participants. Those overseas, just as in past years, will transmit 5- or 6-digit numbers, the first numbers indicating the signal report and the last three the power input. Stations with 500 watts input would use a power number of 500; those with 25 watts, 025.

## EXPLANATION OF DX CONTEST EXCHANGES

### Stations in U.S. and Canada Send:

	<i>RS or RST Report of Station Worked</i>	<i>Your State or Province (or Abbreviation)</i>
Sample (c.w.)	579	VT
Sample ('phone)	57	Vermont

### Stations Outside U.S. and Canada Send:

	<i>RS or RST Report of Station Worked</i>	<i>Three-Digit Number Representing Your Power Input</i>
Sample (c.w.)	579	075
Sample ('phone)	57	500

## CONTEST TIMETABLE

### 'Phone Section:

<i>Time</i>	<i>Starts</i>	<i>Ends</i>
GMT	Feb. 11th 2400	Feb. 13th 2400
AST	Feb. 11th 8:00 P.M.	Feb. 13th 8:00 P.M.
EST	Feb. 11th 7:00 P.M.	Feb. 13th 7:00 P.M.
CST	Feb. 11th 6:00 P.M.	Feb. 13th 6:00 P.M.
MST	Feb. 11th 5:00 P.M.	Feb. 13th 5:00 P.M.
PST	Feb. 11th 4:00 P.M.	Feb. 13th 4:00 P.M.

The second period of this contest starts at these same hours  
Mar. 11th.

The second period of the contest ends at these same hours  
Mar. 13th.

### C.W. Section:

GMT	Feb. 25th 2400	Feb. 27th 2400
AST	Feb. 25th 8:00 P.M.	Feb. 27th 8:00 P.M.
EST	Feb. 25th 7:00 P.M.	Feb. 27th 7:00 P.M.
CST	Feb. 25th 6:00 P.M.	Feb. 27th 6:00 P.M.
MST	Feb. 25th 5:00 P.M.	Feb. 27th 5:00 P.M.
PST	Feb. 25th 4:00 P.M.	Feb. 27th 4:00 P.M.

The second period of this contest starts at these same hours  
Mar. 25th.

The second period of this contest ends at these same hours  
Mar. 27th.

*Example: JA3AF, 500 watts input, might send "569500" on c.w., "56500" on 'phone.*

U. S. and Canadian amateurs will transmit an RS or RST report *plus their state or province*, or some abbreviation for the state or province. *Example: W2SAI, New Jersey, might send "579NJ" on c.w., or say "57 New Jersey" on 'phone. Note that W (K) and VE/VO entrants will no longer indicate power inputs.*

For purposes of conformity, it is suggested that W/VE c.w. amateurs use this tabulation to indicate their states or provinces. Overseas operators may use it as a check-off list of states and provinces worked, and for logging abbreviations.

W1 — CONN MAINE MASS NH RI VT

	G5BA	3/26	1430	469CONN	559100
	G6ZO	3/27	1822	579CONN	589125
	G5RI	3/27	1851	469CONN	459075
Germany	DL1KB	2/26	1315	559CONN	449050
	DL1DX	2/27	1149	469CONN	559080
	DL1BR	3/26	1502	559CONN	559045

Sample of report form that must be used by W/VE c.w. participants. When a station is worked for less than the maximum number of points allowed, the additional contact to make up the points not earned in the first contact should be entered at the bottom of the sheet. Canadian entrants should allow two blocks for each country, but may record no more than eight contacts therein. A separate set of sheets should be used for each band.

«

shows that this does not pay off very often. On c.w. W/VE amateurs have quotas, but this doesn't apply to 'phone. Amateurs overseas have no quotas; they will attempt to QSO as many stations in the 19 W (K) and VE/VO licensing areas as possible on each band, 160 through 10 meters.

Keep your log carefully and send a copy of it, in the form shown, to ARRL. Free contest forms are now available upon request from ARRL, West Hartford, Connecticut. Get your station functioning at top efficiency, make no social commitments for the important week ends, read the rules to acquaint yourself with the details, and then get set for DX aplenty.

## Rules

- 1) *Eligibility:* Amateurs operating fixed amateur stations in any and all parts of the world are invited to participate.
- 2) *Object:* Amateurs in the continental U. S. and Canada will try to work as many amateur stations in other parts of

Sample of report form that must be used by W/VE 'phone entrants and all participants outside U. S. and Canada, 'phone and c.w. This example is a U. S. A. 'phone log. Foreign competitors, of course, would have reverse information in the "Sent" and "Received" columns; their "Received" column would show exchanges like "579CAL," "589ONT" (or, on 'phone, "46 Vermont," "58 Georgia," etc.), indicating signal reports received and different states and provinces worked; their "Sent" column would carry signal reports and power indicators transmitted.

(Name of Club)

I certify, on my honor, that I have observed all competition rules as well as all regulations established for amateur radio in my country, and that my report is correct and true to the best of my belief. I agree to be bound by the decisions of the ARRL Award Committee.

Operator's Signature

\* Figure in this box is multiplier.

Sample of summary sheet that must accompany all reports.

the world as possible under the rules and during the contest periods.

3) *Conditions of Entry:* Each entrant agrees to be bound by the provisions of this announcement, the regulations of his licensing authority, and the decisions of the ARRL Award Committee.

4) *Entry Classifications:* Entry may be made in either or both the 'phone or c.w. sections: c.w. scores are independent of 'phone scores. Entries will be further classified as single- or multiple-operator stations. Single-operator stations are those at which one person performs all the operating functions. Multiple-operator stations are those obtaining assistance, such as from "spotting" or relief operators, or in keeping the station log and records.

5) *Contest Periods:* There are four week ends, each 48 hours long: two for 'phone work and two for c.w. The 'phone section starts at 2400 GMT, Friday, February 11th and Friday, March 11th, ends 2400 GMT, Sunday, February 13th and Sunday, March 13th. The c.w. section starts at 2400 GMT, Friday, February 25th and Friday, March 25th, ends 2400 GMT, Sunday, February 27th and Sunday, March 27th.

6) *Valid Contacts:* In the 'phone section, all claimed credits must be made voice-to-voice. In the telegraph section, only c.w.-c.w. contacts count. Crossband contacts may not be counted.

7) *Exchanges:*

a) *Amateurs in U. S. and Canada* will transmit a three-figure number, representing the RST report, plus their state or province. (The latter may consist of an appropriate abbreviation.) 'Phone participants will transmit a two-figure number consisting of the readability-strength report plus the state or province. *Example:* W1ATE in Connecticut might transmit "579CONN" on c.w., "57 Connecticut" on 'phone.

b) *Amateurs outside W (K) and VE/VO* will transmit six-figure numbers, each consisting of the RST report plus

three "power" numbers; the power indicator will represent the approximate transmitter power input. 'Phone contestants will transmit five-figure numbers, each consisting of a readability-strength report and the three "power" numbers. *Example:* VK2EO, with 100 watts input, might transmit "569100" on c.w., "56100" on 'phone. If the input power varies considerably on different bands, the "power" number should be changed accordingly.

8) *Scoring:*

a) *Points:* One point is earned by a W (K) or VE/VO station upon receiving acknowledgment of a contest exchange sent, and two points upon acknowledging an exchange received. Two points are earned by any other station upon receiving acknowledgment of a contest exchange sent, and one point upon acknowledging an exchange received.

b) *Final Score:* W (K) and VE/VO stations multiply total points earned under Rule 8(a) by the number of countries worked on one band plus the number of countries worked on each other band. All other stations multiply total points earned under Rule 8(a) by the sum of the number of W (K) and VE/VO licensing areas worked on one band plus the number of W (K) and VE/VO licensing areas worked on each other band.

Countries will be those on the ARRL Countries List. There are 19 licensing areas: 10 in the United States, 9 in Canada (VO, VE1-VES). [See Countries List on p. 60 and Footnote 1 on p. 132 — Ed.]

9) *Repeat Contacts:* The same station may be worked again for additional points if the contact is made on a different frequency band. The same station may be worked again on the same band if the complete exchange for a total of three points was not made during the original contact on that band.

10) *Quotas:* The maximum number of points per country per band which may be earned by W (K) stations in the

**Proven Operating Ability.** Some test their mettle as operators in the "SS" — others have a fine time and roll up accomplishments by brief daily participation in their Section traffic net. There's no better way to become an expert in procedure and the ability to copy accurately. The fullest enjoyment of all that amateur radio affords in working DX and other operating specialties goes hand in hand with operating ability and copying proficiency. This month we're glad to start honoring those consistently turning in BPL-dimensional totals by listing the first to receive the Traffic Medallions. See the rules and first announcement in August *QST* if you need more information. Any individual amateur working at his own station is eligible.

Speaking of "copying down" ability, ARRL provides to all comers daily transmission of code practice at stated speeds aimed at assisting newcomer and old-timer alike in knowing where he stands on the matter of copying ability. If not ARRL-certified, be sure you look for W1AW or W6WOP on their next Qualifying Runs. Send us what you get to be considered for certification. Don't stop with an initial speed unless at the top. Stay with us until you have the full set of endorsement stickers. Prove to yourself and others what you *can* copy, and at the same time you will have extended the range of what you can do in communication with amateur radio. If your casual hamming has never gone ahead to include DX countries and traffic ability along with some experimenting, this can be a suggestion to expand know-how and horizons in the New Year.

We've heard the sad story of the fellow who flunked the exam because he "guessed" he knew enough to pass. Few that have copied over the air until they got their 10-w.p.m. certifications

(instead of maximum) progress. We mention this just to suggest, in starting the year, that all amateurs and amateur groups, including the Novice, work for new results, objectives, and top results, rather than the minimum, to get the most fun and know-how from amateur radio.

**Club Operating-Versatility Contest?** This is the season of the year when a good many affiliated radio clubs are starting their code and theory classes (and holding examinations) for the club members and other community members interested in qualifying for licenses. Also, clubs are announcing in many cases special events — a working toward WAS or competitions for the greatest number of DX QSLs that can be earned and turned in by club member operators as of some date next spring — encouraging competition between club members to help them reach these desirable goals. WILLY comes forward with an idea that it would be interesting to set aside some designated week end for a Versatility Contest. The idea would be to credit all-around station and operator ability. The "package" set-up in the operational rules would establish a quota to limit points attainable by any one means, or band, to a small number. Then *multipliers* would be applied (1) for each band worked; (2) each mode of emission (e.w., a.m., f.m., n.b.f.m., f.s.k.-RTTY, a.f.s.k.-RTTY, s.s.b., facsimile and or TV); (3) each mobile band operated 'phone and e.w. (additional multipliers to that for fixed operation); (4) multiplier for originating one message; (5) multiplier for putting this into section-NTS net (each band or mode used); and (6) for working one foreign country outside the North American continent.

## Operating Calendar for the New Year.

The first month of the year is one of the top ones of the season from the standpoint of things to do in radio operating. Stations can be tested, states got for WAS and other awards. There's the V.H.F. "SS," Jan. 8th-9th, for the v.h.f. man; for the newcomer (and others to work him) the "NR" runs from Jan. 8th-23rd — a few QSOs a day and you have it "made"; appointees look forward to their quarterly e.w. and 'phone parties the week ends of the 15th and 22nd. DX men probably will be busy getting rigs and antennas ready for the ARRL DX Competition for which scheduled periods in February and March have been announced. To attract the foreign participation the W (K) and VE/VO contingent will identify their states and provinces (helping the DX station fill out working them all!) following the signal-report part of the

ever flunked the Novice Test; and few ARRL-certified through 20 w.p.m. ever failed on their General Class code test. The majority who have trouble, we're told, are those who mistakenly try to get by or are mistakenly working for medium

exchange this time; returns from across the water being the customary six numerals. So earmark the calendar and contest announcements you are interested in, and get in the swim. — F.E.H.

OCTOBER CD QSO PARTIES

Despite the depredations of Hurricane Hazel, which roared up the Atlantic Seaboard and left some appointees minus power and antennas, our c.w. CD Party was a highly successful event. The notable exploits of top-scorer W6MUR are chronicled with the accompanying photograph. Another Californian, ORS W6BIP, earned second place with 174,265 points. Rounding out the top three, Assistant Director W4KFC made his customary impressive showing with 155,295 points. Sections-worked honors were copied by W6MUR with 67, while W4KFC led in number of contacts with 486 in just 11 hours 30 minutes on the air.

An even dozen operators in the 'phone session turned in scores over 10,000. Tops among them was the 18,150-pointer of W9KDV, with W9VFX doing the talking. And CD regulars W8NOH and W4HQX, both of whom may always be relied on for outstanding voice work, earned second and third positions. QSO leader was W9KDV with 110, and W5MFX worked the most sections, 36.

The highest scores follow. Figures after each call indicate score, number of contacts and number of ARRL sections worked. Final and complete results will appear in the January CD Bulletin.

BRIEF

Myron Clowden, W1YLL, Secretary, Port City Amateur Radio Club, sponsors of the Worked All New England award, advises that the first fifty WANE certificates have been issued to the following amateurs: W1FTJ, W1BFT, W1CDX, W2JHL, W6ZZ, W1TY, W1LQ, W1VCF, W1TCR, W1VCH, W8AQ, W2NLY, W3OP, W1GKJ, W1MEG, W2QHH, W2KTU, W1WTG, W1BJP, W1EET, W1MRQ, W2JCO, W1EFN, W2RSV, W2WZ, W1FZ, W2TYC, W4HYW, W1RNA, W1GMH, W1TYU, W1BBN, W1TOP, W1RLS, W1RFC, W1JWJ, W1FPS, W1NHJ, W8AL, W1HWE, W1VZI, W1AXN, W1WJA, W1YCU, W1UZR, K2BH/W1QGU, W1VMC, W1LIG, W1VVO, W1HA. Rules for obtaining the WANE award appeared on page 63, September 1953 and page 69, August 1954 QSTs.

Any c.w. CD Party enthusiast who hasn't worked this fellow lately better turn in his receiver and headphones! Posting the nation's best score in both July and October, OO Bill Johnson, W6MUR, has really been ringing the bell. His tape fist and snappy operating bring credit to the CD gang, as does that crisp-keying "big sig" stemming from the home-brew 450THs at the right. Time was when 80 meters was thought a "must" as far as amassing huge tallies was concerned, but W6MUR does FB on just 40 and 20; in October he stacked up 151 QSOs in 67 sections for a smashing 271,953 points. Shown fingering the bng and bending over the operating table, Bill portrays the traditional stance of the inveterate DXer. Indeed, DX is his main interest. And if he can again be enticed from pursuit of Africans and Asiatics, you'll see him in the January CD!

CODE-PRACTICE STATIONS

The following schedules bring up to date the list of stations (p. 75, November QST) currently transmitting code practice in the ARRL Code-Practice Program.

W3VEJ, James Alcorn, 207½ Longfellow St., Vande-grift, Penna.; 7150 kc.; Mon. and Thurs., 2100 EST; 5-15 w.p.m.

W4ZRH, Carlton R. Commander, 17 Joyee St., Mt. Pleasant, S. C.; 3700 kc.; Mon. through Fri., 1830 EST; 5-13 w.p.m.

W0ONF, for Se Kan Radio Club, Kenneth M. Parker, Box 141, Howard, Kansas; 3805.5 kc.; Mon., Wed. and Sat., 1730 CST; 3½-15 w.p.m.

NATIONAL CALLING AND EMERGENCY FREQUENCIES (kc.)

C. W.		'PHONE	
3550	14,050	3875	14,225
7100	21,050	7250	21,400
	28,100		29,640

During periods of communications emergency these channels will be monitored for emergency traffic. At other times, these frequencies can be used as general calling frequencies to expedite general traffic movement between amateur stations. Emergency traffic has precedence. After contact has been made the frequency should be vacated immediately to accommodate other callers.

The following are the National Calling and Emergency Frequencies for Canada: c.w. — 3535, 7050, 14,060; 'phone — 3765, 14,160, 28,250 kc.

NATIONAL RTTY CALLING AND WORKING FREQUENCIES

3620 kc.	7140 kc.
----------	----------

The principal theme of letters being received by your NEC these days seems to be complaint regarding QRM to emergency operations on 75 meters. Before we make the comments that we're going to make, let it first be admitted that considered and impartial afterthought does not always coincide with actions or attitudes in the pressure of the moment. Or, to put it another way, it's all very well to rationalize, but not always so easy to act accordingly.

It is maddening to have someone's casual CQ break up a message concerned with the safety or life of a person or persons, and perfectly natural for one's thoughts on such occasions to be along lines of daggers, machine guns and gallows. When such QRM appears to be deliberate (very difficult to prove), and derogatory remarks are passed around ("tin soldiers," "paper policemen," etc.), it is indeed difficult to restrain a homicidal impulse; the only wonder is that all that results are numerous letters to us saying, in effect, that "there oughta be a law." We know; we've been through the wringer ourselves.

But — and here comes that rationalization — we cannot help but observe that the most crowded band in the radio spectrum is really not the best suited for emergency communications purposes. This is especially true in the evenings, when long skip conditions wash out local communication almost entirely and bring in stations from far away loud and clear. By all logic, it is ridiculous to try to pursue an emergency purpose under such conditions when it could be done easily, given the proper equipment, using a frequency band without such idiosyncrasies. Still, logic or not, the guys are *there*, on 75; most of them *cannot* use other bands, for one reason or another, so what are we going to do about it?

Several suggestions have been made. W4NV proposes establishing monitoring frequencies (3801 and 3995 kc.) and appointment of "National Emergency Broadcasting Stations" in each state to man the two frequencies during any emergency. His plan is very reminiscent of our former National Emergency Net, and reminds us to remind you that there still exists a set of National Calling and Emergency frequencies for just such purposes. W4ANK, incensed at QRM from stations participating in a contest during Hurricane Hazel, urges a national or divisional emergency organization aimed at reducing QRM on emergency frequencies, automatic conversion of traffic nets to emergency nets during an emergency, and some means of making allowance for an emergency arising during a contest.

Certain provisions already exist for emergencies, and perhaps before considering the merits and demerits of proposals being made, we should examine those which now exist. Let's do this briefly:

(1) FCC provides a measure of respite for amateurs plagued by QRM in emergencies in its Section 12.156 of the amateur regulations. This is summarized in our booklet *Emergency Communications* (p. 8), and outlines a procedure by means of which stations operating in an emergency may apply to FCC for a "clear channel."

(2) Nets of ARRL's National Traffic System are under instructions to activate themselves automatically in the event of an emergency, to handle emergency traffic if called upon. This procedure was described in an *Emergency and Traffic Bulletin* some time ago, and is due for repetition. Many non-NTS traffic nets have an agreed-upon procedure for automatic conversion for emergency purposes.

(3) As mentioned above, we still have National Calling and Emergency Frequencies. You will see these listed in a box somewhere in the Operating News section of *QST* each month (unless the space problem is *extremely* acute, when the editor usually finds room for them elsewhere in the issue). Instructions for their use are included.

The question then is: what other measures need be taken, besides plugging and publicizing present arrangements, to make our alertness for emergencies more widespread and instantaneous? Your thoughts on this question are solicited. Just in passing, however, let's also observe that QRM is a quite natural phenomenon when an amateur band is crowded six-to-a-kilocycle, and the real solution lies not in regimentation of our existing bands, but in "selecting the channel to suit the need" — a clause borrowed from *Emergency Communications*, which more of you ought to read.

— \* —

Extensive flood conditions in Northern Indiana and Illinois precipitated some activity among AREC groups, over the SET weekend of October 9-10 and extending to the eleventh. We have three reports:

(1) In La Grange Park, Illinois, heavy rains caused backup of sewers and natural drainage into the streets and basements. As the situation worsened, W9JJD called Radio Officer W9FKY and suggested some action be taken. The c.d. radio group was activated, and within a very few minutes two mobiles were in action. One of the cars worked with Water Department trucks and the other one accompanied the fire engines. At 1830 that evening as the rain continued a third mobile unit was pressed into action. Shortly afterward, calls from alarmed residents became so numerous that all three cars were placed in service answering them, each accompanied by one or two firemen. All mobiles were kept extremely busy, each with a backlog of calls, until after midnight. W9KMT and W9MAT also participated in this activity.

(2) The Calumet Area Emergency Net was called into action on October 11 by request of Hammond (Ind.) city officials as the Little Calumet River went on a rampage due to heavy rains. The Lake County Amateur Radio Club station, W9ZKW, was set up at the Hammond City Hall, with W9GRA/9 at the Woodmar Country Club in the middle of the flood area. Other fixed portable stations assisting were W9CWO/9 at Highland, W9PVQ/9 at Black Oak, W9SNF/9 at Hammond and W9RWN at East Hammond. EC W9KRJ monitored and assisted in clearing the frequency. Mobiles operated on 1805 kc. and included W9s KRJ PVQ IFC DRJ DWF JZA IBZ WFI MNO DDK UXK RXB MOC EHY UVR WTW ZJH and APO.

(3) In Indiana, the towns of Plymouth and Knox were hard hit. In Plymouth, EC W9AYP set up communication facilities at that point, assisted by W9ATT and W9LDJ with W9JWI of Culver also assisting. Both the Michiana Radio Club and the Mobile Amateur Club of St. Joseph County participated, the former keeping W9AB, the Red Cross station of South Bend, on the air. The Indiana Phone Net also greatly assisted by relinquishing the net frequency for emergency traffic when the occasion warranted. Later, a call came from Knox that help was needed in communications. Eight mobile units with two base station operators were formed into two groups, one for immediate use and the other to furnish relief when needed.

◆

One of the most active mobile emergency groups in the country is the Philmont Mobile Radio Club. W3JGB is NCS of the weekday "Scrambled Egg Net" on 29,193 kc. Everyone or anyone is invited to drop in on this frequency to say hello.

◆

**QST for**

The problem at Knox was protection of the local disposal plant from rising waters. The Mobile Amateur Club of St. Joseph County furnished the equipment and personnel. The c.d. base station, W9UB, at South Bend, acted as a base. W9YEA of Knox did most of the organizing as EC, W9AYP, W9JWI and W9YEA went many long hours without sleep in helping out.

Others not mentioned above who also assisted included W9s GAV DDE UZP AQA AQB YME ZIB CC JEG EKK ECH QWI EHZ AWN SNT QXF EOG YRF LVS MYI BRM YVR OGZ OGF SMW LVS CKR BRM NAR BRR EZS.

On August 15th, the Red Cross in four Florida counties held a hurricane drill in which amateurs actively participated. Many stations throughout the Eastern Florida section gave assistance, and stations out of state assisted in relaying traffic to Atlanta and Washington. The counties involved were Palm Beach, Broward, Dade and Monroe, an area in which reside an estimated 800 amateurs and in which 197 amateurs are registered in the AREC. Eastern Florida SEC W4IM records 73 stations as having participated, 21 of them mobile, in this well-planned and extensive exercise.

The AREC of De Kalb County, Georgia, on the Labor Day week-end repeated their July 4th performance for the Red Cross by assisting in rendering aid to accident victims in the general vicinity of the intersection of Highways 12 and 78 near Avondale, Ga., reported to be one of the worst places for highway accidents. On Friday night 75 meters was used, but QRM and QRN hampered operations, so on Monday the mobiles were shifted to ten meters. Contact was maintained mobile to mobile and with fixed stations set up at police headquarters. Seven accidents occurred within one two hour period, three of them requiring first aid and one involving three cars requiring ambulance service. Red Cross personnel were standing by at the police stations to rush to the scene wherever need was reported by the mobiles. Twelve operators participated in this "Operation Bandaid": W4s NS PUM MV EPM IPL ZUF LXR SOV RVII PDD FKE UMO.

Members of the Blossomland Amateur Radio Association of St. Joseph, Mich., assisted the Berrien County Sheriff Department in providing mobile communication during the heavy traffic period over the Labor Day Week-end. The main control station was set up at the Sheriff's office, using W8MAI/S. Alternate control stations at strategic points around the country were W8s FGB S SCS and RAE. Mobiles were W8s FGB JFW MWO JUA SCS MVO BKL QBN HKT NSA QQO FBV GTM and QFV. The boys operated in eight hour shifts, five units in service at a time. A regular uniformed Deputy Sheriff was assigned to each mobile to perform regular police duties. The frequency used was 1890 kc. Other participants were W8s MXI PQI ORM CRD YKS and WNSQOD.

Another Labor Day exercise was the furnishing of radio communication for the annual Pikes Peak races by Colorado Springs EC W0TV and his gang. The group loaded up their field gear in W0MJD's truck and took off at 0500 on September 6th. Individuals were assigned posts along the winding road to the summit, ten of them in all, to report every racer by number as he passed his post. W0WPK was at the starting line, W0HEM at Post 1 and W0EYN and W0BTI/0 at the summit, operating on 29.624 kc. for the purpose of passing official orders as requested. The others operated on 3885 kc. as follows: Starting line and NCs — W0SDW; Post 1 — W0IMC; midway between Post 1 & 2 — W0ANX; Post 2 — W0HIR; Post 3 — W0PBN; Post 4 — W0MJD; Post 5 — W0CVG; Post 6 — W0CVG; Post 7 — W0MFF; Post 8 — W0QQX; midway between Posts 8 & 9 — W0JMB; Post 9 — W0MEY; Post 10 (summit) — W0PTR and W0VCZ. W0TV was standby on either band at the starting line, operating with his receiver on the PA system so that observers at the starting line could trace the racers to the summit.

Our SECs are improving greatly in the matter of reporting. For the month of September, seventeen SEC reports were received, representing activities of 4256 AREC members, and three new sections have been added to this year's reporting roster: Arizona, Louisiana and Ver-

mont. The September record this year tops that of both 1953 and 1952, and the total number of sections for the year is now 28, compared to 22 in 1953 and 29 in 1952. We're also ahead of last year in total number of reports (135 to 114), but trailing our 1952 record of 157 at this time.

Let's keep those reports coming in, fellows!

### MEET THE SCMs

Thomas J. Morgavi, currently serving the Louisiana section in the capacity of SCM, was issued his first license in 1935 with the call he now holds, W5FMO.

A former Official Relay Station and Official 'Phone Station, he is presently an Official Observer. Since his participation several years ago in a Frequency Measuring Test with a home-built Wien bridge, he has become extremely interested in frequency measurement and has built a secondary standard, cycle counter, and other associated equipment. SCM Morgavi is active in the Greater New Orleans Amateur Radio Club and is trustee of the club station,

W5UK. Two Public Service certificates have been issued to him for his work in the 1947 Florida Peninsula-Gulf Coast Hurricane and the Big Freeze of February, 1951. He likes to handle traffic for overseas stations on MARS frequencies.

W5FMO's station layout consists of push-pull 810s in the final modulated by push-pull 805s, 600 watts on 'phone and c.w.; also a low-power BC-610 exciter, 75 watts 'phone and c.w. Receiver is an HQ-120. Antennas include an 80- and 40-meter vertical, a three-element 20-meter rotary beam, and a Marconi for the small rig. All bands 160 through 15 meters, 'phone and c.w., are used.

Tom expects to be successful in the near future in inducing his XYL, Helen, to get her ham ticket. Baseball and boxing are his favorite sports. The Corps of Engineers, U. S. Army, has employed him as radio operator and radio service engineer since 1940.

### A.R.R.L. ACTIVITIES CALENDAR

Jan. 7th: CP Qualifying Run — W6OWP  
Jan. 8th-9th: V.H.F. Sweepstakes  
Jan. 8th-23rd: Novice Round-up  
Jan. 11th: CP Qualifying Run — W1AW  
Jan. 15th-16th: CD QSO Party (c.w.)  
Jan. 22nd-23rd: CD QSO Party (phone)  
Feb. 5th: CP Qualifying Run — W6OWP  
Feb. 8th: Frequency Measuring Test  
Feb. 11th-13th: DX Competition (phone)

-----------	-----	------------	-----

BPL medallions (see Aug. 1954 QST, p. 64) have been awarded to the following amateurs up to and including September traffic: W2BO, W2JOA, W2JXN, W2KEB, W2KFF, W3CTH, W3CYE, W3WIC, W6LEQ, W6LYG, W6PHF, W6MIA, W6WNA, W6FIS, W7BA, W7PCY, W8RJC, W9CXY, W9DO, W9UJ, W9NZZ, W9VIZ, W0BDR, W0BLI, W0CP1, W0GAR, W0SCA, V06N.

The BPL is open to all amateurs in the United States, Canada, Cuba, and U. S. possessions who report to their SCNs a message total of 500 or more, or 100 or more originations-plus-deliveries for any calendar month. All messages must be handled on amateur frequencies, within 48 hours of receipt, in standard ARRL form.

## TRAFFIC TOPICS

What's in a name? Among the hundreds of nets registered in the ARRL Net Directory, some call themselves traffic nets and some emergency nets, but in actual practice the traffic nets frequently mobilize in an emergency, and the emergency nets usually handle traffic in their drills and test — and always during the real thing. A good general rule in that a traffic net should be an emergency net as well, and an emergency net should also be a traffic net. The designation as one or the other is to indicate the principal, not the only, dedication.

That the emergency net should know how to handle traffic (and that means *doing it* as a matter of course) is incontestable. This is not to say that they all do know how to

handle traffic, only that few people if anyone will argue that they *should*. We think that, generally speaking, emergency nets are better versed in the handling of traffic than traffic nets are in organization for emergencies. And that brings us, finally, to the subject for this column this month; that *every traffic net should have an emergency plan*.

Many already have. We can't mention them all, but more power to those traffic nets which have swung into action in emergencies, and even more power to those which have a plan for doing so. On the other hand, a good many of them handle only routine traffic and, in an emergency, find themselves on the outside looking in — looking for a place wherein they may be of assistance.

The National Traffic System has a policy for emergency operation which was set down in an Emergency and Traffic Bulletin dated Spring, 1950. Its salient points bear repeating. During an emergency, NTS nets should be self-activating; that is, they should be able to swing into action or take care of an emergency situation in any affected area. NTS nets in surrounding areas should be activated to take care of outside communications if and when called upon. Depending upon the urgency involved and the volume of emergency traffic, official or otherwise, the net manager concerned must determine whether his net in any particular situation shall handle official traffic only, all emergency traffic, or all traffic as usual. In most cases it will be possible to handle all types of traffic but to give precedence to official emergency traffic in view of its inherent public interest and importance.

The extent of NTS activation in emergencies will depend entirely on the extent of the emergency. If a local flood, the section traffic net will probably be adequate, with activation of the regional net, if required, to handle outside contact. If the emergency extends over several states or ARRL sections, probably the regional net should be activated in addition to section nets, with "shuttle liaison" from one to the other, and possible activation of the area net to provide outside contact. If the emergency is area-wide, all NTS nets within that area should be on the job, with possible activation of an adjacent area net to provide outside contact.

There is much more to this subject of using traffic nets for emergency purposes than can be discussed here and now. We simply wish to point out that it is not a new idea, and to renew the thought that traffic nets have an emergency application, and that ECs should know of traffic affiliations of any of their AREC members for possible use in emergencies. And you net managers — have you a plan for operation in emergencies? Better give it some thought.

— . . . —

Three miscellaneous October net reports: (1) The Early Bird Net reports traffic amounting to 686. (2) The North Texas — Oklahoma Section Net held 31 sessions, 1010 check-ins and a traffic count of 319. (3) The Transcontinental Phone Net registered 782 message counts with eleven stations participating in the First Area.

— . . . —

*National Traffic System.* NTS has a place for every traffic man if said traffic man has a place in his inclinations for NTS. The System is built on the basis of the "bestest for the mostest." Any amateur who really *wants* to participate may do so, and welcome. This includes old shellbacks who can copy 45 w.p.m. with a four-inch paint brush down to the newest Novice who had to hump to get past five w.p.m.

But this does not mean that you may participate at any level you please. NTS has many levels, and each participant must find his own — section novice or training nets for rank beginners, section traffic nets, regional nets, area nets and the Transcontinental Corps — depending on such factors as experience, dependability, and aptitude. We have been sniped at for this policy, but we still think it's a good one. The system was not set up to serve any individual or organization, but to serve amateur radio by creating an organized nationwide service.

Of course it does not always work as planned; even major leaguers never bat 1.000. If you are not participating, naturally you are hurting NTS, especially if you are one of the experienced traffic men we need to make it work. But we'll do what we can with what we have, and hope that the system will continue to show improvement through the years as traffic-handling amateurs learn that there is pleasure to be had in operating as part of a team.

An announcement: effective November 15, 1954, the ARRL National Traffic System officially adopted a six-day week. Many NTS nets already have been operating on Sat-

urdays and others expanded their schedules to cover Saturday at our suggestion. Some are finding it difficult to obtain Saturday NCSs and liaison stations (volunteers needed). Generally speaking, however, there will no longer be that crucial 48-hour period from Friday to Monday that NTS does not function.

#### October reports:

Net	Sessions	Traffic	Rate	Average	Representation
1RN	20	297	0.47	14.8	92.1%
3RN	16	193	0.70	12.1	97.9%
4RN	24	184	0.58	7.0	46.4%
RN6	42	275		6.5	
RN7	39	237		6.1	37.3%
8RN	32	165		5.1	76%
TEN	68	1826		26.8	58.6%

Sections*	377	2244		6.0	
Summary	702	7562	3RN	17.7	CAN
Record	766('52)	7562		17.7	
Late Reports:					
2RN (Aug.)	22	175	0.25	7.9	87.9%

\* Section Nets reporting: AENB & AENP (Ala.); MSN (Minn.); KYN (Ky.); CN (Conn.); Tenn. Hi Speed & Tenn. Sectional; WSN (Wash.); NEB (Nebr.); SCN (Calif.); WVN (W. Va.); QKS & QKS-SS (Kans.); TLCN (Iowa).

Connecticut, New Hampshire and Western Mass. get stars for perfect attendance on the 1RN report. 3RN started operating a session at 1830, starting November 15. W4OGG has taken the reins as manager of RN5, and VE7ASR is the new manager of RN7; we wish them both the best success. W8DSX says the second session of 8RN is not very well attended. VE3GI commends VE3AJR for her performance on TRN. W8SCW says he is still trying to get out an EAN bulletin. CAN certificates have been issued to W5CAF, W5MXQ and W4TYU; Peggy is having trouble getting NCSs for CAN. If interested, drop her a line or radiogram. A PAN certificate has been issued to W6ZRJ; W7NH is back at the helm of PAN.

The TCC roster is gradually filling up, but some of the long haul schedules are having difficulty with conditions so screwy. What we ought to have are midwestern relays to stand in on the schedules. Anyone want to be considered for that role once or twice per week?

## W1AW OPERATING SCHEDULE

(All times given are Eastern Standard Time)

The W1AW Fall-Winter operating schedule remains in effect. Master schedules showing complete W1AW operation in EST, CST or PST will be sent to anyone on request.

#### Operating Hours:

Monday through Friday: 1500-0300 (following day).

Saturday: 1900-0230 (Sunday). Sunday: 1500-2230.

Exceptions: W1AW will not observe its regular hours from 0300 Jan. 1st to 1500 Jan. 2nd and from 2230 Feb. 21st to 1500 Feb. 23rd.

General Operation: Refer to page 70, September QST, for a chart to determine times during which W1AW engages in general operation on various frequencies, 'phone and c.w. This schedule is still in effect but is not reproduced herewith for space considerations. Note that since the schedule is organized in EST, certain morning operating periods may fall on the evening of the previous day in western time zones. W1AW will participate in all official ARRL operating activities, using scheduled general operating periods for this purpose if necessary.

Official ARRL Bulletin Schedule: Bulletins containing latest information on matters of general amateur interest are transmitted on regular schedules:

#### Frequencies (kc.):

C.w.: 1885, 3555, 7125, 14,100, 21,020, 52,000, 145,600.

'Phone: 1885, 3950, 7255, 14,280, 21,350, 52,000, 145,600.

Frequencies may vary slightly from round figures given; they are to assist in finding the W1AW signal, not for exact calibration purposes.

#### Times:

Sunday through Friday: 2000 by c.w., 2100 by 'phone.

Monday through Saturday: 2330 by 'phone, 2400 by c.w.

Code Proficiency Program: Practice transmissions are made on the above listed c.w. frequencies, starting at 2130 daily. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately ten minutes of practice is given at each speed. Code-practice transmissions will be replaced by Code Proficiency Qualifying Runs on January 14th and February 14th, and by a Frequency Measuring Test on February 8th.

## BRIEF

Ray Grob, jr., W8YFJ, President of Sandusky Valley Amateur Radio Club, reports that a Mobile Caravan held July 18th, sponsored jointly by the Toledo Radio Club, Toledo Mobile Radio Club and SVARC, was a big success. A caravan of 160-meter mobiles started out from Toledo on a tour through the SVARC area, including Port Clinton, Fremont, and Woodville, Ohio. At their home stations the members of SVARC formed a net and worked the mobiles one by one as they passed through the area. In this manner the Toledo boys qualified for the SVARC honorary membership award by working five or more members, and the SVARC gang qualified for the WTO award by working fifteen Toledo stations. QRM was non-existent due to strict maintenance of net discipline.

## DXCC NOTE

Effective November 1, 1954, French India, FN8, has been deleted from the Countries List, since on that date it became a part of India. All confirmations of FN8 contacts prior to November 1, 1954 will be credited for DXCC, but confirmations of contacts after November 1st will be credited as India.

## CODE PROFICIENCY PROGRAM

Twice each month special transmissions are made to enable you to qualify for the ARRL Code Proficiency Certificate. The next qualifying run from W1AW will be made on January 14th at 2130 EST. Identical texts will be sent simultaneously by automatic transmitters on 1885, 3555, 7125, 14,100, 21,020, 52,000 and 145,600 kc. The next qualifying run from W6OWP only will be transmitted on January 7th at 2100 PST on 3590 and 7138 kc.

Any person may apply; neither ARRL membership nor an amateur license is required. Send copies of *all* qualifying runs to ARRL for grading, stating the call of the station you copied. If you qualify at one of the six speeds transmitted, 10 through 35 w.p.m., you will receive a certificate. If your initial qualification is for a speed below 35 w.p.m., you may try later for endorsement stickers.

Code-practice transmissions will be made from W1AW each evening at 2130 EST. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately 10 minutes' practice is given at each speed. References to texts used on several of the transmissions are given below. These make it possible to check your copy. For practice purposes the order of words in each line of *QST* text sometimes is reversed. To get sending practice, hook up your own key and buzzer and attempt to send in step with W1AW.

*Date* Subject of Practice Text from November *QST*  
Jan. 3rd: *A Multiband S13 Final*, p. 11  
Jan. 6th: *The Lazy Man's Panoramic Adapter*, p. 14  
Jan. 11th: *A Public Relations Project*, p. 18  
Jan. 13th: *Audio for the Mobile or Fixed Station* . . . , p. 21  
Jan. 19th: *An R.F. Bridge* . . . , p. 29  
Jan. 21st: *Simplified "Break-In with One Antenna,"* p. 30  
Jan. 24th: *The CD-10-TC*, p. 32  
Jan. 27th: *Fulminatin's from Ol' Fogey*, p. 34

## SUPPLEMENT TO NET DIRECTORY

The following list will supplement and correct the listing on page 78, November *QST*. Please inform us promptly of any errors or omissions so that they can be included in the March *QST* installment. An asterisk (\*) indicates correction from previous listing in November *QST*. This listing brings the record up to date as far as November 17, 1954. Registrations received later than this date will appear in the March *QST* supplement.

• All operating amateurs are invited to report to the SCM on the first of each month, covering station activities for the preceding month. Radio Club news is also desired by SCMs for inclusion in these columns. The addresses of all SCMs will be found on page 6.

## ATLANTIC DIVISION

**EASTERN PENNSYLVANIA** — SCM, W. H. Wiand, W3BIP — SEC, IGW, RM; AXA, PAM; PYF, E.Pa. Nets: 3610, 3850 kc. A new radio club was formed by the amateurs of Tamaqua with meetings held the 2nd and 4th Mon. of each month. The new group has applied for ARRL affiliation under the name of Tamaqua Amateur Radio Club. The organizing officers are RZV, pres.; PTM, vice-pres.; WN3ZRQ, secy.; WN3ZPW, act. mgr.; KJJ chairman, emergency committee. The club publishes a monthly bulletin known as the *Sardine Wrapper*. New officers serving the DX Club for another year are VSS, pres.; PQB, act. mgr.; SDE, secy.-treas. The West Philadelphia ARA offers code and theory classes every Tue. with Novice examinations given every month. Hurricane Hazel found the club station, MKA, fully staffed with OWK, VCE, VCY, RKP, and WN3ZFC at the operating positions. PYF, manager of the PFN, reports a total of 121 stations reported into the net on Hurricane Hazel night with the FCC declaring the net frequency a clear channel emergency frequency. With the aid of the reporting stations, PFN was able to track Hazel at least one-half hour ahead of the weather bureau notifications, PDJ, secy. of the Abington Township ARA now stationed in Baltimore and reporting for other members of ATARA also with Uncle Sam, says RFI is operating 20-meter mobile while stationed at the White Sands Proving Grounds, N. M., and RCE skeds RFI from his QTH in Warrington. OQG is operating 10-meter mobile while stationed at Ft. Devens, Mass. WN3ZUB, YL and sister of PDJ, operates portable from Bucknell University where she's a junior. NQT is back home again at Mountain Top near Wilkes Barre and can be found wherever there is traffic to be handled. Traffic men will be interested to know that NQT was the operator at K4USA signing Hank. Welcome to the E.Pa. Net, Hank. JNQ reports losing all his antennas but one during the big blow. Traffic: (Oct.) W3CUL 4030, PYF 95, NOK 94, AXA 68, BFF 58, GES 56, RXW 52, UOE 51, OZV 50, DUI 46, NQT 46, TEJ 32, MWL 27, OK 26, QLZ 18, YJM 18, PVP 12, JNQ 9, GIY 6, VXQ 6, VPY 5, YGX 3, (Sept.) W3NQT 54, MWL 43, ABT 5, YHX 4, CHU 3, KFK 2.

**MARYLAND-DELAWARE-DISTRICT OF COLUMBIA** — SCM, Arthur W. Plummer, W3EQK — SEC, PRL. The MDD Section Net operates each of the five week days on 3650 kc. at 7:30 P.M. EST. The NCS is WV. The MEPN operates each Mon., Wed., and Fri. at 6:30 P.M. EST and Sat. and Sun. at 1:00 P.M. EST on 3820 kc. The NCM is FDK. The MMRC meets at 9:00 P.M. EST the 1st and 3rd Fri. of each month on 29,560 kc. mobile. The NCS is QLG. QQS now has a new folded dipole antenna. WV appears to be about the most active c.w. man in the section. HC took part in the 2nd Army "Tobacco Leaf IV" activity. TGF calls into MDD and 3RN occasionally. PRT has organized the Lafayette Amateur Radio Club with 17 members. ECP reports that the prize purchase at the recent Falls Church, Va., club auction was a 60-ft. triangular tower by a WN4 for \$1.00. The catch is he has to remove it from the seller's QTH! CDQ attended the Roanoke Division Convention in Richmond Oct. 30th. She reports a visit from Ada, ØRNO, Oct. 3rd. NPQ assisted several WN4s in getting their tickets. TKE won an NC-98 receiver, a BC-906 frequency meter, and a Heathkit grid-dip meter kit. ONB is now the proud possessor of a mill. EEB made a contact recently on 160 meters with his new Viking, his first 160-meter QSO in 20 years. JZY reports he has buried several hundred feet of antenna wire for ground-plane radials at his place. GRF reports operating 4HQN in both the CD and World Wide DX Contests. PZW, jr. operator of WV, at present operates K17FAF. Maj. Frederick B. McIntosh, of the USAF, gave a very interesting talk Oct. 25th to the Chesapeake Amateur Radio Club on "The Effect of the Novice on Ham Radio."

A movie, "The Functions of the Air Research and Development Command" also was shown. Maj. McIntosh is a member of MARS and the Annapolis Radio Club. The MMRC elected VAG as pres. and NKY as secy.-treas. The first hidden transmitter hunt of the Maryland Mobile Radio Club was held Oct. 22nd with 13 mobiles competing. 2PAV stunned everyone by traveling 13 miles and finding 3YLL/3 in 35 minutes. WN3ZBV, secretary of the Woodrow Wilson High School, Washington, D. C., announces that JEP, located at the school, is in operation and ready for business. 1FTV, formerly of Massachusetts, now is 3ZBH. NSV is getting back on the air soon after a two-year layoff. WN3YVR is moving from a trailer to an apartment so he will have more room for a 40-meter antenna. He also is building a 36-ft. ketch in which he intends to circumnavigate the globe with plans for expeditions to remote islands in the South Pacific. WN3YVS is building a Viking Ranger. Hurricane Hazel took down all of EQK's antenna. "Hazel" also took down HWZ's antennas and bent an element on JLY's beam. AVL was flooded out of his country QTH at Hollywood, Md., and HL, at Crisfield, was off the air for a week. JZY lost his antennas up in the hills near Smithburg. Communications for the Mummies Parade in Hagerstown was furnished by 3EHA, 8GPD, 3NZT, OYX, WTO, WWM, and VAM of the Antietam Radio Association. OXL, TJV, and RAH attended the Roanoke Division Convention. MFJ is back after doing some mobiling on 75 meters in Wisconsin and Nebraska. QLF gave a most interesting talk at the first November meeting of the Chesapeake Club on the construction of 10-meter direction finders for transmitter hunts. WKB now has a new 44-ft. vertical for 40 and 20 meters. Your SCM is now an official member of ARRL's Old Timers Club. The Andrews Electronics Assn. is conducting code classes for Novices 5 nights each week. Traffic: (Oct.) W3WV 507, CVE 251, RV 178, COK 131, UE 40, ECP 30, PKC 16, NNX 12, HC 10, WKB 9, (Sept.) W3USA 1110, COK 86, UE 79, ONB 63, RV 55, JZY 35, ECP 30, EQK 5, WKB 2, TGF 1. (Aug.) W3USA 1138, (July) W3USA 1216.

**SOUTHERN NEW JERSEY** — SCM, Herbert C. Brooks, K2BG — PAM; ZI. During Hurricane Hazel the South Jersey Radio Assn. demonstrated its ability to organize quickly and maintain communications on both 2 and 10 meters. Those participating were W2ABQ, K2AFJ, W2ASG, K2BWG, BZK, W3AOE/2, K2DWW, W2EGP, FTO, KN2GHY, KN2GYN, KN2JEI, W2JRO, LY, NFL, W3OEN/2, W2OQN, PAU, PEN, PTM, PZX, QBH, TBD, TXP, VX, YPQ, and YRW. The Burlington County Radio Club also did a swell job with EVR, GOK, JJV, WKI, WUP, and ZNB. NFL now is located in Merchantville. 3ESX's new QTH is Audubon. The JP Net promoted a transmitter hunt to stimulate activity on 10 meters. SDB is doing a good job keeping everyone posted on DX activities, especially the International DX Contest. K2JIG is a new member of this section. Woody is ex-3BOX and is located in Glassboro. KN2JJC and KN2HXD are interested in starting a Novice Net. If interested, please contact these fellows. ZVW is on 15 meters working DX in addition to his regular EAN assignment. SUG has received his MARS certificate. BAY is rebuilding all his antennas as a result of the hurricane damage. ASG also has repairs to make. ZI has returned from a Florida vacation; he worked mobile all the way. KN2JID is the dad of K2ART and K2DSL. K2CLD has dropped the "N" and is heard occasionally operating W2ZQ. The Hamilton Twp. Radio Assn. is planning to reactivate its Friday night mobile net. Traffic: W2RG 126, K2BG 66, W2ZI 14, SUG 12, ZVW 12.

**WESTERN NEW YORK** — SCM, Edward G. Graf, W2SJV — Asst. SCM; Jeanne Walker, 2BTE. SEC: UTH/ FRL. RM: RUF. PAMS: GSS. NAI. NYS meets on 3615 kc. at 6:30, and 3925 kc. at 7 P.M.; NYSS on 3595 kc. at 8 P.M.; NYS C.D. on 3509.5 and 3993 kc. at 9 A.M. Sun.; TCPN 2nd call area on 3970 kc. at 7 P.M.; SRPN on 3970 kc. at 10 A.M.; ISN on 3980 kc. at 3 P.M. The v.h.f. group of the RARA held a meeting at the QTH of UXP. K2CUR received a personalized, hand-made QSL card nearly 3 ft. square from 1BWB. EMW has the 50-watt rig on while getting the bugs out of the 813. Under the leadership of K2BEG, CUU, LXE, CYE, and K2s HUK and DVD provided mobile communications for the annual Sports Carnival Races held in Buffalo. RHQ worked 40 miles on the first try on 420 Mc. K2AAH/2 is working mobile to and from college. QBB is working DX on 40 meters running 500 watts to a pair of 813s. Receiver is a BC-312, antenna a 7-Mc. ½-wave Zepp up 25 feet. K2CEH is the most active ham on 220 Mc. in the Rochester Area. Also on are POM and RTB. ZYQ was elected prexy of the Utica ARC with SSL, vice-pres.; and QJH, secy.-treas.

A committee headed by QXA will handle Novice and Tech. Class exams. SSL, with the help of former 8KOD and WNK, is organizing c.d. KBT has resigned as manager of NYSS. OPD has been named as NYSS mgr. with BNC as asst. mgr. Hurricane Hazel removed UTH's 2- and 6-meter beams. FE is active in Frequency Measuring Tests and LO and CD Parties. Speakers at RAWNY meetings were TKO on RTTY, and R. Russell and C. Confers, of Bell Labs, on Meters and their Uses. NAI, Schoharie EC, reports that her group was activated for the S.E.T. QCO now is 4FSS in Florida. BGN was M.C. of the OT Nite sponsored by the RARA. ICE presented the RARA OT show, films, and displays at the New England Division Convention. GVJ has a new 20-meter beam. GBN dropped the "N." KN2s IJV, INP, and JBV are members of the Timon HS ARC. K2BU1 uses a Matchbox and VFO and is building a Heathkit VFO for his brother, IZNH/2. We regret to report the passing to Silent Keys of VZ. OLIH is on 80 meters with 45 watts, S-40B receiver and 75-ft. long-wire antenna; also on 7050 kc. KEL would be glad to have those who hear his Official Bulletins come back to him for repeats if desired. Hurricane Hazel took down RUT's antennas. There is much interest in the code classes conducted by K2GDI. CXM lost his antenna during Hurricane Hazel but is back on 20 meters with a kw. QQ visited VE3DJJ while vacationing. NYS is cooperating with NTS on a full-time schedule. Traffic: (Oct.) W2RUF 525, QHH 171, K2DXV 125, W2BNC 108, HKA 96, K2DSR 84, W2ZRC 65, OE 50, K2BU1 36, DJN 30, W2DSS 29, CXM 22, EMW 14, SJV 13, GBX 9, K2CUQ 6. (Sept.) K2FAV 393, DJN 14, W2RQF 11, OPD 10, DVE 5. (Aug.) K2DJN 9.

**WESTERN PENNSYLVANIA**—SCM, R. M. Heck, W3NCD—SEC: GEG. RMs: UHN, NUG, GEG. PAMs: LXE and AER. The WPA Traffic Net meets at 7:30 p.m. on 3585 kc. Newly-organized is the Radio Club of Indiana County with the following officers: VKD, pres.; OTN, vice-pres.; YUG, secy.; Cliff Porter, treas.; and WXX, act. mgr. Good luck, gang, and keep us informed as to your activities. LOD reports on the McKean County Radio Club activity. Those active in the S.E.T. there were SJV, LQQ, OCR, LPO, MEY, and WN3ZMF. The Club also is attempting to hold study in radio and code and has set up a committee to aid in mail-licensing needs there. The Radio Association of Erie still holds weekly classes in theory and code and is having a bumper attendance, with enrollment around 75. STK is chief instructor with NXX, VNB, and KNQ assisting. The RAE c.d. mobile units have been conducting tests to find the best spots for good coverage of the county and expect soon to cooperate in a c.d. test. A box social was held and enjoyed by all who attended. Fine lunches, movies, and music were the features. WSO is new General Class licensee in the area. A reliable source reports MMI and OIH taking to the air now with wings as well as by radio. Put both together and let us know how they come out. I also had the fine newspaper, *KWH*, here but am sorry to report that I seem to have mislaid it at this writing and will have to humbly ask the SCARC to please excuse my bad manners. However, I can report that the SCARC was host to the Western Pennsylvania Amateur Radio Club Council at its October meeting, when the following officers were elected: GEG, chairman; OVM, vice-chairman; KWL, secy.; and MTP, treas. Traffic: W3WUQ 1978, QPQ 206, LHM 154, YA 92, LQX 54, UHN 30, NCD 13, UTR 12, LXE 11, PWN 8, RVS 8, MIZ 6, KNQ 5.

## CENTRAL DIVISION

**ILLINOIS**—SCM, George T. Schreiber, W9YIX—Section nets: ILN (3515 kc.), IEN (3940 kc.). RMs: BUK, MRQ. PAM: UQT. Sec: HOA. Asst.: VTL. Cook County EC: HPG. 1VMIW, author of *How's D.A.*, again has returned to the section and is operating under his old call, 9BRD. More than 25 amateurs handled the communications for the Chicago civil defense authorities in a mass feeding experiment early in November, the first time hams were called on to do such work. Calls included HPG, FZI, GRW, ZRF, YWH, NPN, KIK, QAO, GPV, SES, BWN, YLB, ZCG, VSV, ZQG, QQS, KCW, PZP, PEN, HXI, IKZ, MCS, ZIH, GOB, and EGB. Possibly there were some others we have left out. JMG is a new OPS. New OPS appointees are AA and YBS. KJ has a kw. on the air which he claims is TVI proof. PBI again placed first in the September F.M.T., with ATV second and 6CIW/9 third. Incidentally 6CIW, who is a Naval Commander, has been ordered to Puerto Rico, 10th Naval District, as industrial manager. PTZ is stationed in Japan and is trying to get a 20-meter rig going to talk to his dad, STZ. The Southtown Net operates in the Chicago Area each Mon. at 7:30 p.m. with HPG as NCS, and on Tue. with GPV directing the western section. Frequency is 29,640 kc. VL is back on the air operating on 7 and 21 Mc. His former call was EWG. VTO has moved to Iowa. SEH, ACZ, and ZYE are the amateurs composing the license exam committee of the Twin City Radio Club. The Quarter Century Wireless Operators Assn. is putting on a drive for members. Chairman of the Illinois chapter is LZ, with WR, CYD, and EVA the other officers. REC, ex-SAUB, again is operating in Illinois and enjoyed the S.E.T. New Novice calls are JZK, KZA, and IXN. They are interested in forming a Novice traffic net. HUX

built a new relay rack out of a discarded day bed. Tech. The Starved Rock Radio Club makes it a practice to keep track of the membership in ARRL of club members and reminds them of expiration. The XYL of IDA is recovering from an operation. TLC is back on the air after recovering fire damage. DKW has completed a new station with Viking II and NC-183D. ZEN finished his boat in time to store it in the garage for the winter. RQY really has been busy at OO work. He sends in a list of 22 stations to whom friendly warnings were mailed. FLL and IOS enjoy 15 meters with great success. LI is working DX like mad with his new switchable vertical. His brother, GDI, also has a vertical that works, but neighbors have a pool on when it will bend double in the wind. YLU motored to Mexico City and secured a permit to operate as XE5PD. KWK is a new call in this area. Goodbye and luck to NXC, who is moving to California. As assistant radio editor for a Chicago paper Tony always had a good word to say for amateur radio in print. The committee for the '55 DXCC Convention is FID, QIV, FKC, and NN. The latter is trying to interest ex-BB in again getting a ham call. ATH and CKU are eying the multi-band vertical antenna. OAV, after three years of study, can now order a cup of coffee in Spanish. The strange frying noise in PEB's modulator has stopped, but so has the modulator. The fire department had a nice run to his home. KHJ is now on 20, and 10 meters is again peaceful. Traffic: (Oct.) W9D0 1338, KYFCA 1050, W9AA 124, YIX 81, QGG 74, HPG 67, OR 46, CEE 43, MRQ 41, SXL 30, W9NGMK 26, W6CIW/9 25, W9LXJ 21, STZ 16, REC 13, FRP 10, VTO 10. (Sept.) W9OR 32, LMC 13, HPG 8, FRP 4. (July) W9OR 49.

**INDIANA**—SCM, George H. Graue, W9BKJ—The Indiana Radio Club Council (IRCC) met at Indiana U., Bloomington, Oct. 24th. Officers elected were CMT, pres.; QBJ, vice-pres.; WTY, treas.; GRA, secy.; IHO, MBL, and JBQ, directors. ECs in Hammond, Plymouth, and Knox offered amateur radio assistance during the recent heavy rains. Mobile units of the Mobile Amateur Radio Club of South Bend, the Michiana Radio Club, and the Lake County Amateur Radio Club were in operation. The LCARC has 11 active 160-meter mobile units, and is setting a goal of 15 2-meter mobile units. WWT reports for RFN with a total traffic of 203; OLN, for QIN, reports a total of 446; NTA, for IFN, reports a total of 119. New in Evansville are N9KCU, KFE, KDJ, and KEP. Active in Princeton are URQ, ZZR, AYK, ZYV, N9JEP, IYR, IYX, and N4HUR/9. OVB has an 813 rig per Jan. QST. GPR has an all-band mobile. WEI is active on 20- and 40-meter c.w. or 'phone from Lake Lawrence. TGX is active at Vincennes on all bands with a B. & W. rig. RVM has 30 countries and 43 states on 15-meter 'phone. GZT is active on 80-meter s.a.b. GFS and UMS were mobile in Canada. DGA was elected president of TARS. The TARS transmitter hunt was won by NYX. The ham colony at Saint Meinrad Archabbey consists of NTR, WWF, ABW, UVJ, INT, AOO, N9INX, and 2GQW/9. ERB transmits Official Bulletins on 2, 6, 20, 40, and 80 meters. The IRC will have an amateur radio exhibit at the hobby show in Indianapolis. HXR received a 20-w.p.m. sticker. NZZ has 150 on his DXCC. SNT rebuilt for higher power. The Mike and Key Club of New Albany purchased 24 mobile and 2 base stations for the 2-meter F.M. Net. The Clarke Co. Radio Club has code and theory classes under way. LNA and ZVS are on 29-Mc. mobile. DFW is active on 80- and 40-meter c.w. EAO has a new modulator. TT is building a new shack in the basement. WRO is active on 75-meter 'phone. JKR is on with a complete Heathkit station. 80PZ now is 9PSJ in Muncie. CEA has a new antenna. KLR worked Virginia for his 21st state on 2 meters. Traffic: W9UJ 1524, NZZ 686, SNT 667, JBQ 466, TT 401, QYQ 213, UQP 168, UWU 100, STZ 81, VNV 49, WRO 44, EH2 40, NTA 31, CMT 30, SVL 30, YIP 26, CC 25, KDV 25, TG 25, YB 22, EQO 21, RPL 21, BKJ 16, DKR 16, FYM 14, DOK 12, WBA 12, ZIB 12, YVS 7, NHI 6, QR 6, DGA 4, CEA 3, NTR 3.

**WISCONSIN**—SCM, Reno W. Goetsch, W9RQM—SEC: OVO. PAMs: ESJ, GMY. RMs: IXA, RTP, UNJ. Nets: BEN, 3950 kc., 6 p.m. daily; WIN, 3625 kc., 6 p.m. daily; WPN, 3950 kc., 1215 Mon.-Sat., 0930 Sun. Mobile and c.d. frequency: 29,620 kc. VBZ received a BPL Medalion, and qualified for Traffic 12,000 Messages Club. ESJ has 4 states worked on 144 Mc. Net certificates (BEN) were issued to UTN, GTJ, WLW, and FFC. WWJ operates only week ends. OVO reports that there are 437 members and 187 mobiles officially registered in the Wisconsin AREC. SZR has 43 countries with FQS, CE6, TF, and EAS on new inverted "Y" Windom 100 feet high. UVA and RUB won the FLARC hidden transmitter hunt. RUB is building a two-element 20-meter beam. FFC is building a Viking II rig. LSK is E.E. student at M.U. New officers of the Point Radio Amateurs are CFW, pres.; DPN, vice-pres.; BCC, secy.; treas. CES and CFW have dropped the "N" from their calls. UIM is working on break-in for his station. UIT, after 5 years of almost 100 per cent daily transmissions of ARRL Bulletins, has decided to relinquish his OBS schedule. MRAC members participating in harbor accident communications were GPI and HIF fixed, and YFW, PD, SNK, and ONY, mobiles. UFX, Wisconsin RO, is getting the State RACES Net on an operational basis. MQK is Madison RO, while UGT is a new EC. HAT has TBS-50 and SX-43.

SQM's mobile has Gonset Super-6 and Stancor transmitter with Hy-C whip on 75 meters. MRAC mobiles CUW, TKY, MPF, VLK, ROH, and ONY took part in M.U. Homecoming Parade. The MSOE Club (HHX) has as new officers 0CEO, pres.; IBNA, vice-pres.; 6IM, secy.; 9AXY, treas.; VCH, trustee. ANX is interested in RTTY. After losing his S28, DYL is designing around a pair of S26s. Now at MSOE, 6IM has been licensed since 1923. Congrats to IXA on an FB issue of the WIN bulletin. IU operates from the WHKW site with a B. & W. 5100 and S-20 or 348-L, and Windom antenna 100 feet high. KKK has TBS-50 and S-20R with VHF-152A. LVB's new QTH is a "Ham's Paradise." Traffic: (Oct.) W9VBZ 843, ESJ 346, WJW 99, IXA 62, RPT 61, FXA 57, SAA 55, GMY 36, OVO 13, SZR 11, RQM 9, LSK 8, RUB 8, AEM 7, IBF 6, RKP 6, KWJ 4, FFC 2. (Sept.) W9KWJ 10.

## DAKOTA DIVISION

**NORTH DAKOTA**—SCM, Earl Kirkeby, W0HNV—RM: FVG. PAM: GZD. ORS: CAQ, EBA, KTZ. OBSs: KZZ, MXD. Sorry we had no news to report the last two months but, fellows, if you want our section to appear in this space every month let us know what you are doing. Thanks to the few who faithfully send in their traffic reports every month. I know most of you have been too busy this summer for ham radio but with winter here we expect renewed activity. Orchids to GZD for the fine job of rejuvenating the North Dakota 75-meter 'Phone Net, which meets on 3845 kc, at 6 p.m. every night except Sun. SHZ has dropped the "N" from his call. DAO now is at Condo, N. Dak. QOB is active at Devil's Lake and UXQ is stationed at Finley, N. Dak. Your SCM reports the arrival of YL operator No. 1 at his house Oct. 9th. Traffic: W9KTX 179, EXO 142, KLP 141, FVG 85, NPR 69, EBA 62, KZZ 8.

**SOUTH DAKOTA**—SCM, J. W. Sikorski, W0RRN—Asst. SCMs: Earl Shirley, 0YQR, and Martha Shirley, 0ZWL. SEC: GCP. RM: SMV. PAMs: BNA, PRL, NEO. DES received a Ranger for his birthday. BNA is NCS of the NJQ Net, with NEO as assistant, and GDE is NCS of the night 75-Net, with RMK as assistant. EYB, now General Class, has a new Globe Scout. The Mitchell ARC is conducting "Amateur Radio from Scratch" classes. GCP now has a Gonset converter in his Ford. October average attendance on the 75-Net was 37 per session. The C.W. Net reports a total QNI of 117 in 13 sessions, handling 46 messages. SMV is asking for more operators on the C.W. Net. BJH, NOT, and RRR attended 3 weeks' microwave school in Omaha. The 160-Net reports 436 QNI in 30 sessions. MJZ reports some of the Brookings gang are working on 420 Mc. Thanks to those who sent in reports. Traffic: (Oct.) W6SMV 61, GDE 52, MPQ 49, DVB 35, SCT 30, ZWL 26, NEO 17, GCP 12, BNA 9, O0Z 6, 0JQ 4, AYD 3, HOH 1, WUU 1. (Sept.) W0PRL 20, DVB 7.

**MINNESOTA**—SCM, Charles Bove, W0MXC—Asst. SCM: Vince Smythe, 0GGQ. SEC: GTX. RMs: DQL, OMC. PAMs: JIE, UCV. The St. Paul Radio Club, Inc., held an election of officers. Results were as follows: IHKF, pres.; THY, 1st vice-pres.; KWG, 2nd vice-pres.; PAK, secy.; and FGN, treas. HFY is planning on going on 2 meters. KLG is the new manager of the MSN C.W. Net. DQL has a new Viking. DQL, KLG, IFY, and TKX attended the Midwest Division Convention at Des Moines. KJZ is visiting 4ZDB and family. WQL is a new ham in Minneapolis. The Mankato Radio Club's station is now licensed with the call WCL. TOK now has his General Class license. OJH bought a new SX-71 from LUX. QKA is teaching code at the Mankato Vocational School. All beginners are requested to join the class on Thurs. nights. DJT is in the hospital and should be OK by the time you read this. BWF has purchased a 20-meter beam from LLL. The St. Paul Radio Club's emergency station, REA, has in its possession a bunch of new equipment. This includes four 2-meter Gonset Communicators, four Gonset Commanders which are 30-watt transmitters for all bands, 6 through 80 meters, and three 2-, 6-, 10-, and 11-meter receivers with 2 more on the way, together with various generators, mikes, antennas, etc. These boys really are serious about emergency work. QBW has been working DX since getting on 20 meters. TQQ is back home again after operating portable up near Ely all summer. KFN and EUI were mobiling in Florida. OVO is reactivating K0WAA at the National Guard Armory in Minneapolis. He will be using the big vertical tower on the 6th Ave. side. Traffic: W0WNA 289, KLG 213, KFN 127, KNR 91, UCV 69, IRJ 55, DQL 48, QNY 48, TKX 40, EHO 34, GTX 32, LST 30, LUX 30, PBI 25, KJZ 24, OJH 22, TJA 19, TUS 15, HKJ 14, GGQ 13, ABA 10, CID 10, RVO 10, ALW 9, MNC 8, BZG 6, DYC 6, GWU 6, GWJ 5, PUO 4, BUO 3, LIG 3, QDP 3, OPA 2.

## DELTA DIVISION

**ARKANSAS**—SCM, Owen G. Mahaffey, W5FMF—Hi, gang, here we go with our first report. First let us all thank our past SCM, Fred Ward, LUX, for the great job he did for us. The OHK Net meets at 7 p.m., on 3695 kc., Mon. through Fri. Meet you there. VQD paid us a visit. He is building a pi-network antenna tuner. CAF meets

RN5 and is doing an FB job. Send a report on what you are doing and what you want. Ham clubs should appoint a reporter to send me the dope on what you do, meeting nights, dates, etc., as I may drop in sometime.

**LOUISIANA**—SCM, Thomas J. Morgavi, W5FMO—PAM HEJ advises that an emergency 'phone net has been organized for the Monroe Area which meets on 1825 kc. at 0900 Sun. HEJ and IVF have CD appointments in Monroe. KRX is back on after working over his transmitter. ZSP lost his plate transformer but expects to get back on soon. In the meantime he is practicing on his Lampkin 105 for the next Frequency Measuring Test. GIX advises no 2-meter activity to the west but several contacts in Mississippi and Florida. The Istrouma ARC is sporting a panel truck with a BC-654, BC-669, a new PE201, 1-kw. a.c. generator, and a brand-new club call, HUD. ONM is its president. LV is MM on 15 meters. INL has a new Johnson Ranger on the air. IIA is an s.s.b. fanatic and is active on 75 meters. BUK is constructing a new bandswitching exciter. JCC has gone mobile. VND is back in town and on the air. UPM is operator on the SS *Dick Lykes* and is operating MM. SEC IUG reports the participation in the nationwide Simulated Emergency Test of Oct. 9-10 was very successful. Contact was maintained with 11 areas in Louisiana by the State Civil Defense Mobile Communications Control Center. Participating were LFF, DHE, UXG, KHJ, YCO, IHR, MWE, YNG, DKU, FM0, and SQB. NLK reports 26 hours transmitter operation time, 5 hours of which were spent sending 17 bulletins, 21 hours ragchewing, and no time testing. That last item should be noted and adhered to by all of us. Ex-SCM DKR is back and active on 40-meter c.w. His jr. operator, a Novice, is GRW. Traffic: (Oct.) W5NDV 91, EA 36, MXQ 31, HEJ 13, SQI 2. (Sept.) W5KRX 12, MWE 10, HEJ 8. (Aug.) W5KRX 74.

**MISSISSIPPI**—SCM, Dr. A. R. Cortese, W5OTD—We need some new ECs in various cities. Let's get Mississippi well lined up. Now for the news: TIR is now in Jackson. EPI has a new General Class license. CTY is now in Japan. That's all the news as received. Traffic: W5VME 201, EWE 73, TIR 56, KYC 34, JHS 33, CTY 28, OTD 4, BSE 2.

**TENNESSEE**—SCM, Harry C. Simpson, W4SCF—SEC: RRV. PAM: PFP. RM: WQW. PL still is vacationing in Texas. Weather reports now are being given by stations QNI Tennessee 'Phone Net. Information thus collected is being used by a Nashville TV station as a public service. FWX and CRP are opposing candidates as president of the Memphis Club. TPI's homecoming game fell on the same date as the S.E.T., so UWA/4 had many visitors. DZM, ZLT, APD, ZLZ, IAY, ZLK, WXL, ETJ, SGU, ZJY, PVD, and WJH visited and operated the 20-watt emergency rig set up by UWA, GUE, and KN4AAU. A new ham in So. Fulton, Tenn., is KN4AOK, just 11 years old. FLW reports 6- and 10-meter use during the S.E.T. BQC now is working Jackson, Memphis, and Marks, Miss., on 2 meters with sixteen-element rotary beam. A nice RN5 Bulletin was received from Mgr. OGG, who informs us that all NTS nets are now 6-day. WQW reports both c.w. nets are in full swing and invites more attendance. UWA reports fine attendance on the Upper Cumberland Net, with CTF missing no sessions. Roses to PVD and UWA for the fine UCN Bulletin. Thanks to the efforts of WQW, AEE, and others, the c.w. net was an integral part of the Tennessee Communications Alert and colors are flying! HHH is a new ORS. New ECs are RHK and BTS. RRV reports the section in fine shape on ECs with only a few counties open. Traffic: (Oct.) W4OGG 813, PFP 138, IIB 129, HHH 119, K4FET 113, W4BQG 110, WQW 103, UWA 100, OEZ 52, WAX 52, SCF 49, TZD 35, RRV 30, PQP 29, ODR 24, UVS 24, VJ 24, RET 17, YPG 14, WJ 13, IV 12, PNG 12, BAQ 11, FLW 10, PVD 10, COY 9, PAH 9, RMJ 8, TIE 5, WN4HSX 3, HUT 3, W4SGI 1. (Sept.) W4UZY 35, PQP 32, BBD 9, TUO 5.

## GREAT LAKES DIVISION

**KENTUCKY**—SCM, Robert E. Fields, W4SBI—Looks like JUI is our No. 1 station with an OO appointment. He is working on the 6- and 2-meter rig and already has receivers and standards for those bands. CDA has a very potent 'phone signal on 75 meters now, the first time on 'phone since he got his ticket in 1930. SYD says skip is causing him no end of trouble handling traffic on KYN. WN4GTC is asking for information about a Novice net on 30 meters. WNH has an 82-element beam up for 2 meters, but blew up a relay on the big rig, temporarily curtailing operation on 80 meters. K4FBW has completed a 6146 parallel final and is rebuilding an exciter. KKW is working the traffic nets, KYN, 9RN, and UTL, and getting his share of traffic. YZE is a new OBS appointee and is doing an FB job with Official Bulletins. The following stations make up the KYN C.W. Net: BAX, BAZ, BBU, BRI, CDA, K4FBW, FR, FGF, HFA, IAY, JBQ, JCN, JDU, JHU, JSH, KFA, KKG, KKL, KKW, KTA, LDL, LUR, LXA, MGT, MRT, MMY, MWX, NBY, NEP, NIZ, NVR, OEE, OGP, OXX, PRT, PXX, RAE, RHZ, RYL, SBI, SUD, SXP, SYD, SZL, TAV, TRQ, TQC, UVH, UWA, UYA, VBA, VKC, VYO, WAO, K4WBG, WHIC, WNF,

(Continued on page 82)

## POWER AMPLIFIER

1000 Watts Continuous Wave\*

1000 Watts Amplitude Modulated Phone\*

1000 Watts Single Sideband\*

\*Maximum power input allowed by FCC for amateur service

A magnificent new kilowatt... unequalled in performance... luxurious in appearance! This boldly styled Viking Kilowatt is truly tomorrow's concept of electronic equipment design and operating convenience. Of course you'd guess it's built by Johnson, unquestioned leader in the amateur transmitter field.

Operating the Viking Kilowatt is a never-to-be forgotten experience... you'll marvel at the ease of selecting SSB, AM, or CW with the flip of a single switch... you'll enjoy the convenience of its desk top controls... and you'll immediately sense the authority of its full kilowatt signal lifting you into a select group of leading amateurs... commanding the admiration of all. You'll be delighted, too, knowing that all this can be yours at an unbelievably low price. This Viking stands alone as a crowning achievement in all things that make a perfectly engineered kilowatt a pleasure to own and operate.

For more than just a look at the functional exterior beauty of the Viking Kilowatt, a deluxe brochure with the complete inside story may be yours on request. Write for your copy today.

CONTINUOUS COVERAGE FROM 3.5 TO 30 MC. MAKES THE VIKING KILOWATT AN IDEAL CHOICE FOR COMMERCIAL APPLICATIONS, TOO.

This compact pedestal contains the complete Viking Kilowatt. Excitation requirements are 30 watts RF and 15 watts audio for AM and 10 watts peak for SSB. The Viking "Ranger" transmitter/exciter (shown above) is an ideal RF and audio driver for AM and CW, and the New Viking SSB transmitter/exciter, soon to be announced, will drive the Viking Kilowatt to full output on SSB.

Interior view showing conservatively rated power equipment, heavy duty (PP810) modulator and push-pull ventilating fans. Shielded RF power amplifiers are parallel connected 4-250A's. High voltage supply (872A's) delivers 2500 volts at over 700 ma. Screen supply is VR tube regulated.

The Viking Kilowatt is compact yet completely accessible. Containing RF power amplifier, modulator, power supplies, and all control equipment, the entire unit rolls out of the pedestal on ball bearing rollers. This provides complete accessibility to all electrical components for adjustment or maintenance.

COMPANY • WASECA, MINNESOTA

## 'HF' CAPACITOR

## The Ideal High Frequency Tuner!

The "HF" is a single section tuning capacitor, employing the same rotor and stator design found in the famous Hammarlund "APC" which is still recognized after 20 years as the standard capacitor of its type. Extra long sleeve bearing and positive contact nickel-plated phosphor bronze wiper make the "HF" ideally suited to high frequency applications.

Silicone treated steatite insulation. Single hole or base mounting. Special spacing or capacity values, finishes and other modifications are available to manufacturers on special order.

For your free copy of The Hammarlund Capacitor Catalog, which gives listings of the complete line of standard capacitors, write to The Hammarlund Manufacturing Co., Inc., 460 West 34th St., New York 1, N. Y. Ask for Bulletin C1.

# HAMMARLUND

(Continued from page 78)

WNH, WPY, WXL, YDL, YYL, YZE, ZCI, ZCM, ZDA, ZDB, ZKS, ZLK, ZPM, ZRE, and ZXO. Most of these stations already have earned their Section Net certificates. Traffic: W4KKW 180, K4FBW 138, W4ZLK 92, SBI 80, SYD 30, JCN 25, ZDB 22, PXX 20, AZQ 18, CDA 16, JUI 6.

**MICHIGAN** — SCM, Fabian T. McAllister, WSHKT — Asst. SCMs: Bob Cooper, 8AQA; and Joe Beljan, 8SCW. SEC: G.H. RMs: URM, NUL. At this writing the SCM has just returned from a couple of weeks down in Norfolk and Portsmouth, and found the mailbag loaded with letters from the gang! Patience, fellows, and I'll get them all answered. There was a goodly pile of traffic reports, too, and quite a few new calls were seen. Welcome, fellows, let's hear from you often. ELW made BPL again this month; our only one. Looks like Seth is going out after that award in earnest. MQH and OQH are new NCS on QMN, and have been doing very well. FX is battling power-line noise in the receiver, and thinks he has it licked. MGQ has moved to Huntingdon Woods, so won't be heard (except on mobile) for a month or so. DLZ reports a new "wind direction indicator" on his garage roof. He says his 40-meter vertical really leans under the wind! The Mount Pleasant Club has taken over the radio class in the Adult Education Program at High School. The Motor City Club has a new and very interesting club bulletin. The Hard Luck Award of the month goes to SCS. He moved as far into the country as he could in order to avoid powerline QRM, etc., and now the power company is building a high voltage line (and we do mean high!) right past his property! Traffic: WSELW 517, NUL 280, ILP 187, FLI 175, ZLK 150, IX 110, RTN 94, NOI 78, FX 59, MQH 52, QOQ 50, MLR 48, JKN 45, NTC 41, DSE 36, PHA 29, OQH 25, TBP 22, IV 17, TIJ 17, HKT 14, ZHB 14, OT 12, MGQ 11, DLZ 10, INF 8, KXN 8, WVL 8, AUD 7, EGI 7, HSG 7, WXO 6, IJ 5, JPE 4, PHM 1.

**OHIO** — SCM, John E. Siring, W8AJW — Asst. SCMs: J. C. Erickson, 8DAE; W. B. Davis, 8JNF; and E. F. Bonnet, 8OVG. SEC: UPB. RMs: DAE, FYO. PAMs: EQN, HUX. In an effort to more closely coordinate the State's communication department OVG, Dayton, has been appointed Asst. SCM and EQN, Springfield, has been made a PAM. On Oct. 9th the Ohio Council of Amateur Radio Clubs held a meeting in Columbus. The delegates voted in favor of FCC Docket No. 11157. New OCARC affiliates are the Toledo Mobile Radio Assn. and Franklin Mike and Key. A copy of the Council's constitution and by-laws may be had by writing Ralph E. Cramer, W8VHO, 236 South Burgess Ave., Columbus 4, Ohio, secy. The OCARC offers trophies for both Field Day and Sweepstakes Contests, awards the WAOC certificate, and sponsors the Ohio Intrastate QSO Party. EQN is contest and awards manager. HUX is on s.s.b.s.c. with an 8875 exciter and 813 final. LJ has moved from Dayton to Cleveland. LJS, former QSL Mgr., has returned from Florida to live in Cleveland. DAE got tapped by an induced voltage from lightning during a recent snowstorm. WAV was appointed NCS, Air Force MARS Net No. 9. RXM is the call of the Dayton Civil Defense Hq. GDQ was heard by EL2X and LU3EL on 160 meters. MQQ made WAS, SPU and QOV are holding the c.d. fort in Wyandot Co. NYL was married Oct. 23rd with 94ZN as best man and 9QBJ as usher. ZOD got married recently. The Tiffin group meets the 1st and 3rd Mon. at 8:00 p.m. in the Tiffin City Hall. The CACARC reflected its 1954 officers. Thirty-one Toledo amateurs participated in the recent S.E.T. with CRA and HUX serving as net control stations; 44 messages were handled. Congratulations to ERR and his group on the noteworthy job they did during the recent Ohio River flood. According to DSX, mgr. of 8RN, RO, DSX, LHV, and FYO are the most consistent Ohioans in the net. TLW lost his masts three times during the month, once because of termites, once from a windstorm, and lastly from falling tree limbs. Dayton's RF Carrier advises that PTF and HCD are on s.s.b.s.c. on 75 meters; HB, CUJ, YCP, and GQ rank 1, 2, 3, and 4, respectively, in the Ohio section in the recent F.M.T.; FIB showed up as a fireman at a fire at HCD's QTH recently; JAO/M now is a minister in Athens; KKH recently suffered a broken ankle; ZOF is suffering from an allergy called drooping antenna; and the Dayton 5:00 p.m. Mobile Net meets on 29,600 kc. We regret to report the untimely death of DL, and extend our deepest sympathy to his family. Cincy's Mike and Key states that PR and YTM are in Germany where they are working with the "Voice of America," while Queen City's other publication, *Ether Waves*, informs us that LPD and PBU have 32-element 2-meter beams; EV recently worked his 143rd country; and 14 members have gotten past the 100-countries-worked goal. The *Fort Hamilton Bulletin* mentions that HXB lectured on grid-dip meters at the last club meeting and RIDJ was a guest at a recent get-together. Springfield's Q-5 advises that the club soon will become incorporated. The Columbus *Carascope* states that MRC has installed three 9 full-wave 20-meter "V" beams; BAX has worked 20 states on 144 Mc.; OMV has a kw. on s.s.b.s.c.; and GL has returned from the hospital. *Shack Gossip* from over Toledo way tells us that there are 10 licensed YLs in town; NB,

**THE HQ-140-X...**

# SEEMS TO STRETCH THE BANDS

HQ-140-X

In these days, when the amateur bands are more crowded than ever, it's important to make sure the receiver you buy will bring in the desired signal with minimum interference from adjacent channels. That's why more and more 'hams' are turning to the HQ-140-X communications receiver.

The HQ-140-X's outstanding performance under today's difficult operating conditions is achieved because of the Hammarlund patented 455Kc crystal filter and phasing network. This circuit, identical to the one used in the Super Pro-600-JX professional receiver, is controlled by a front panel 6-position Crystal Selectivity switch and provides

an OFF position and five increasingly selective bandwidths.

The Crystal Phasing control is a differential-type variable air capacitor which permits precise adjustment of the crystal selectivity for extremely high attenuation of closely adjacent channel interference.

Because there is no interlocking effect, the Selectivity or Phasing Controls can be changed without de-tuning.

#### THE HQ-140-X IN ACTION AT SEA

The HQ-140-X is the receiver in the radio shack of many American Merchantmen. Its dependability and ruggedness make it very popular with seagoing hams.

Get the details on these and other important advantages of the HQ-140-X. Write to The Hammarlund Manufacturing Co., Inc., 460 W. 34th St., New York 1, N. Y. Ask for Bulletin R1.

## Heathkit GRID DIP METER KIT

MODEL GD-1B

**\$19.50** Ship. Wt.  
4 lbs.

with additional blank dials for individual calibration. You'll like the ready convenience and smart appearance of this kit with its baked enamel panel and crackle finish cabinet.

The invaluable instrument for all Hams. Numerous applications such as retuning, neutralization, locating parasites, correcting TVI, adjusting antennas, design procedures, etc. Receiver applications include measuring C, L and Q of components—determining RF circuit resonant frequencies.

Covers 80, 40, 20, 11, 10, 6, 2, and 1 1/2 meter Ham bands. Complete frequency coverage from 2–250 Mc. using ready-wound plug-in coils provided with the kit. Accessory coil kit, Part 341-A at \$3.00 extends low frequency range to 350 Kc. Dial correlation curves furnished.

Compact construction, one hand operation, AC transformer operated, variable sensitivity control, thumb wheel drive, and direct reading calibrations. Precalibrated dialing coils. Free calibration. You'll like the ready convenience and smart appearance of this kit with its baked enamel panel and crackle finish cabinet.

## Heathkit ANTENNA COUPLER KIT

The new Heathkit Antenna Coupler Model AC-1 was specifically designed to operate with the Heathkit Amateur Transmitter and will operate with any transmitter not exceeding 75 watts RF input power.

Rugged design has resulted in a sturdy, well shielded unit featuring a copper plated chassis and shield compartment. Coaxial 52 ohm receptacle on the rear of the chassis connects to a three section Pi-type low pass filter with a cut-off frequency of 36 Mc.

Tuning network consists of a variable capacitance and tapped inductance in an impedance matching unit.

Capacity coupled neon lamp serves as a tuning indicator and will also provide a rough indication of power output.

tive null indicator. Shielded aluminum light weight cabinet. Strong self supporting antenna terminals.

The Heathkit Antenna Impedance Meter is basically a resistance type standing wave ratio bridge, with one arm a variable resistance. In this manner it is possible to measure radiation resistance and antenna transmission line impedance; approximate SWR and optimum receiver input. Use it also as a monitor or as a field strength meter where high sensitivity is not required. Frequency range of the AM-1 is 0–150 Mc and range of impedance measurements 0–600 ohms. The circuit uses a 100 microampere Simpson meter as a sensi-

**HEATH COMPANY**

## HUDSON DIVISION

**EASTERN NEW YORK** — SCM, Stephen J. Neason, W2ILI — SEC: RTE, RM: TYC, PAMS: GDD, IJG. K2EHI has a very effective 14-Mc. beam working. Congrats to K2BSD, who made BPL again. I regret to report the passing of our PAI, JQI; also 71PM, recently modified to K2HTD. K2HVN is active on NNETN. OKI is working plenty of DX on 7 and 14 Mc. with a new all-band rig and dipole antennas. CGT, WVS, and ZBS have new sixteen-element beams on 144 Mc. MHE is back on 144 Mc. and is organizing a v.h.f. society. AIH and K2BCU are operating portable from Boston on 144 and 29 Mc. LEL joined the CAP. LWI moved from Long Island to Pok and is active on 144 Mc. with an 829 final. HIQ squirts a signal from Brewster on 144 Mc. Welcome to BGO, who moved into Rockland County. HJO has a new VFO for his Bandmaster. LDS and PCQ have new beams on 144 Mc. HFQ, RO for Rockland, is on 144 Mc. from Nyack. Our annual Eastern New York section conference held at the YMCA in Pok recently proved to be worth while and interesting to all who were able to attend. Your SCM acted as chairman. SEC RTE and EC LDS were in charge of the arrangements and provided the meeting place. Other officials and guests present were OBU, Hudson Division Director; 1NJM, ARRL NEC; BGO, of the NYSCD commission; J. Gaul, C.D. Director Putnam County; and ECs LEL Ulster, ZTZ Rockland, and HZZ Pok. K2DQH is mobile on 29 Mc. K2BRY is operating portable from Johns Hopkins University. Because of a change in QTH BVU will be limited to mobile and portable operation on 144 Mc. New in Schenectady is KN2JTY. RML is back on 144 Mc. All clubs interested in the Eastern New York Council of Clubs, please write EFU for information. Traffic: (Oct.) K2BSD 536, BE 50, EOQ 42, W2EFU 31, ILI 24, K2EHI 12, HVN 5, W2APH 1. (Sept.) K2EOQ 20, W2BSH 18, K2HVN 4.

**NEW YORK CITY AND LONG ISLAND** — SCM, Carleton L. Coleman, W2YBT — Asst. SCM: Harry Dannels, 2TUK. SEC: ZAI, PAM: JZX, RMS: VNJ, LPJ. ZAI reports a good increase in AREC activity with excellent S.E.T. results. KGN, Brooklyn EC, sparkplugged the biggest AREC gain in the section. Nassau County radio amateurs once again demonstrated amateur radio in action at the Mineola Fair, operating K2DHC/2 on all bands. YBT is active from a new location in East Hampton on 75 and 80 meters and reports that WSL is 100 per cent ham-controlled at the transmitter plant with W2s AJR, BTC, CRZ, and YBT there. AEE participated in the Columbia University Bicentennial Convocation. K2CRH reports that the BAREC Net has shifted operations to 3700 kc. and invites Novice participation, listening for KNs around 3710 kc. GP says he has been QRL but reports into four nets and had a high score in the CD Party. MDM says business pressure keeps him from more than 20 hours of hamming per week. K2EWJ reports fine results with new 20-meter two-element shortened beam with Viking II and HQ-140X. The CCNY club station, HJ, is on the air with high power and 75A-3 receiver. KN2JPG is a new Novice at HJ. K2HTO recently dropped the "N." Stayvance HSRC, CLE, has reorganized with K2DGR, president, and K2DKQ, trustee. The station is on the air with an NC-98 and ARC-5 looking for traffic skeds around 3650 kc. weekdays between 1250 and 1400. The Amityville Memorial School Club has elected KN2IYK, pres.; and K2DOQ, vice-pres. New members of the Fordham Radio Club are W2AMR, K2HID, and KN2s IAD, JBK, and JRR. NFW is on 10 meters with 300 watts to a ground plane. K2HKH has a pair of 6146s in the new rig under construction. K2AMP was made a Class I Observer. Besides some excellent observing, Wally visited 1AW and had time to snag F8FW/FC on 20 and 40 meters. K2DGT is active on 20, 40, and 80 meters with HT-18 pushing 813s. IEH can be heard on 75 meters. EBZ reports excellent attendance at the Amateur Radio Teletype Society meeting, where BFD demonstrated some RTTY gear. K2EOF and KN2ITS are new members of the ever-growing NYRC. AEF has changed Novice code and theory instruction to Wed. night. K2IYK

## Heathkit VFO KIT

MODEL VF-1

**\$1950**

Ship. Wt. 7 lbs.

Here is the new Heathkit VFO you have been waiting for. The perfect companion to the Heathkit Model AT-1 Transmitter. It has sufficient output to drive any multi-stage transmitter of modern design. A terrific combination of outstanding features at a low kit price. Good mechanical

and electrical design insures operating stability. Coils are wound on heavy duty ceramic forms, using Litz or double cellulose wire coated with polystyrene cement. Variable capacitor is of differential type construction, especially designed for maximum bandspread and features ceramic insulation and double bearings.

This kit is furnished with a carefully precalibrated dial which provides well over two feet of calibrated dial scale. Smooth acting vernier reduction drive insures easy tuning and zero beating. Power requirements 6.3 volts AC at .45 amperes and 250 volts DC at 15 mills. Just plug it into the power receptacle provided on the rear of the AT-1 Transmitter Kit. The VFO coaxial output cable terminates in plastic plug to fit standard 1/2" crystal holder. Construction is simple and wiring is easy.

- Smooth acting illuminated and precalibrated dial.
- 6AU6 electron coupled Clapp oscillator and OA2 voltage regulator.
- 7 Band coverage, 160 through 10 meters—10 Volt RF output.
- Copper plated chassis—aluminum cabinet—easy to build—direct keying.

Open layout—easy to build—simplified wiring.

Smooth acting illuminated dial drive.

Clean appearance—rugged construction—accessible calibrating adjustments.

Ceramic coil forms—differential condenser.

Copper plated chassis—careful shielding.

## Heathkit AMATEUR TRANSMITTER KIT

MODEL AT-1

**\$2950**

Ship. Wt. 16 lbs.

### SPECIFICATIONS:

Range 80, 40, 20, 15, 11, 10 meters.  
6AG7 ..... Oscillator-multiplier.  
616 ..... Amplifier-doubler  
5U4G ..... Rectifier.  
105-125 Volt A.C. 50-60 cycles 100 watts. Size: 8 1/4 inch high x 13 1/4 inch wide x 7 inch deep.

Crystal or VFO excitation.

Prewound coils—metered operation.

Rugged, clean construction

Single knob hand switching.

Built-in power supply.

52 ohm coaxial output.

Here is a major Heathkit addition to the Ham radio field, the AT-1 Transmitter Kit, incorporating many desirable design features at the lowest possible dollar-per-watts price. Panel mounted crystal socket, stand-by switch, key click filter, A. C. line filtering, good shielding, etc. VFO or crystal excitation—up to 35 watts input. Built-in power supply provides 425 volts at 100 MA. Amazingly low kit price includes all circuit components, tubes, cabinet, punched chassis, and detailed construction manual.

## Heathkit COMMUNICATIONS RECEIVER KIT

Four band operation 535 to 35 Mc.

Stable BFO oscillator circuit.

RF gain control with AVC or M.V.C.

5 1/2 inch PM Speaker-Headphone Jack.

Six tube transformer operation.

Electrical bandspread and scale.

Noise limiter—standby switch.

### SPECIFICATIONS:

Range.....535 Kc to 35 Mc  
12BE6 ..... Mixer-oscillator  
12BA6 ..... I. F. Amplifier  
12AV6 Detector—AVC—audio  
12BA6 ..... B. F. O. oscillator  
12A6 ..... Beam power output  
5Y3GT ..... Rectifier  
105-125 volts A.C. 50-60 cycles, 45 watts.

A new Heathkit AR-2 communications receiver. The ideal companion piece for the AT-1 Transmitter. Electrical bandspread scale for tuning and logging convenience. High gain miniature tubes and IF transformers for high sensitivity and good signal to noise ratio. Construct your own Communications Receiver at a very substantial saving. Supplied with all tubes, punched and formed sheet metal parts, speaker, circuit components, and detailed step-by-step construction manual.

MODEL AR-2

**\$2550**

Ship. Wt. 12 lbs.

### CABINET:

Proxylon impregnated fabric covered plywood cabinet. Ship. weight 5 lbs. Number 91-10, \$4.50.

**HEATH COMPANY**  
BENTON HARBOR 9, MICHIGAN

is now General class and can be found rock-bound on 7052 kc. AOD worked 7 stations on 420 Mc. in the recent V.H.F. QSO Party. PF now is single-sidebanding with 20A exciter. KR, JVO, GJX, K2DW, and others are pushing high power on s.s.b. It was your reporter's pleasure to attend the recent QCWA dinner with my OM, GG. The old-timers had a splendid turnout and presented an excellent audience for KUJ's talk on s.s.b. The QCWA Net meets on Sun. at 1100 on 3810 kc. RB soon will be heard on 144 Mc. now that the boating season is over. GYL was heard chasing DX on 7 Mc. EEN has high-power final under construction. With 1955 upon us, let's check our equipment so that we radiate the best signal possible. Watch the modulation and the keying. Remember, too, switch to safety! See you in the V.H.F. Sweepstakes. Traffic: (Oct.) W2KEB 697, K1V 642, LPJ 411, K2CQP 301, W2AEE 153, OMIE 84, K2CRH 80, W2JOA 63, K2ABW 58, W2GP 40, GXC 39, K2DDU 17, W2EC 17, 1AG 14, GPQ 12, K2HID 10, EWJ 9, CMV 3, W2JBQ 3, OKU 3, K2DVT 2, HYK 1, W2TUK 1, (Sept.) K2EOR 175, DEB 54, W2GXC 52, JGV 30, ZM 16, MUM 9.

**NORTHERN NEW JERSEY** — SCM, Lloyd H. Manamon, W2VQR — Asst. SCM: Charles Teeters, K2DHE, SEC: IIN, PAM: CCS. RMs: NKD, CGG, EAS. K2DSW is temporarily QRL because of school at RCA in New York City. K2CHI was active in the CD Party. The Irvington Radio Amateur Club meets in the Community Center Bldg. the 1st and 3rd Mon. of each month. Code and theory classes are conducted every Mon. night. Automatic tape machines are available for code practice, which are run at speeds qualifying the students for either Novice or General Class. Interested parties are invited to attend the club meetings and code classes. If you desire to work the Club Net look for it on 28.7 Mc., every Sun. at 1200 hours. This is a very business-like club, gang, so take advantage of the offer and pass the word around to prospective new hams. If you desire to write the club, contact K2DZR, 65 Garrison St., Newark. K2BEV again is active in OO work. CQB, PAT, GUM, ENM, and K2DHE put on a demonstration of amateur radio communications for local fire departments. The Windblowers V.H.F. Society held its installation dinner on Nov. 14th. A special QSL card still is available to anyone working a member of the society. K2EUN is NCS on JN each Mon. evening. Bogota is organizing a mobile civil defense net. K2GPB has his new mobile rig working FB. KN2JOM is working out real well with his Heathkit transmitter. BRC worked in the CD Party for the first time in over four years. K2BCK will be QRL after this month because of active duty at sea with the Navy. EAS has been out of town on a business trip K2BAY is back on the c.w. bands and is doing a bit of experimenting on antenna systems. Brad also is active on the New Jersey C.W. Civil Defense Net, 3505.5 kc., Sun. at 1900. 2ZEP/7 is in the Air Force down Arizona way. He has obtained an ORS appointment in the Arizona section, but will be back in Northern New Jersey next year. DRV is active in JN, daily except Sun.; 3695 kc. OO reports were received from DME, GVZ, TPJ, NIY, K2BEV, AFQ, and BWQ. K2DHE is making test runs with his new mobile installation up and down Sunset Ave. Much QRM to K2ICE results from these tests which pass by in front of his QTH. Annie, the assistant YL operator at K2ICE, holds the local QSO record on 144 Mc. K2HNA discovered to his extreme regret that his 144-Mc. antenna has been terminated at the change-over relay box. Result, no DX. HJL is on 75-meter 'phone with the new rig. George visited New England and came home with his brother's 150-B rig. KN2GVB is keeping the 144-Mc. band hot at his QTH. NIE has terminated his yachting activities for the season and is back on 75 meters again. K2CTL is sporting a new ham shack in the attic. The arrival of a new daughter forced him to vacate his former downstairs comfortable shack. K2ARQ, a member of the local Marathon QSO Net, stays right with them with the aid of a full pot of coffee. Traffic: (Oct.) W2CQB 68, K2BWP 61, BWQ 43, EUN 42, W2EAS 26, FMP 21, K2IKS 14, W2BRC 10, K2GER 8, W2CVW 6, K2BAY 5, BCK 4, KN2JOM 3, K2CHI 2, W2CJX 2, NIY 2, (Sept.) K2DSW 63, W2DRV 12, (Aug.) W2DRV 16.

## MIDWEST DIVISION

**IOWA** — SCM, William G. Davis, W0PP — PP re-turned much refreshed from his vacation. Many thanks to SCA for subbing for me. The North East Iowa Radio Club had a very successful c.d. drill Oct. 31st, with 13 mobile rigs and all towns in Black Hawk County using their emergency rigs. BDR and SCA have received their traffic award medallions. BLH was elected TLN mgr. CGY is getting some DX with his 1½-kw. TNY completed his 813 VFO-controlled all-band transmitter and gave it to the radio club. BXR, IIMM is conducting radio classes at the club with 30 prospects up for examination soon. There are 5 YLs in the class. BJP, laid up with kidney trouble, is getting in a lot of hamming. LJW is a new ORS. ZAN is back on TLN. KVJ, a recent addition to TLN, is NCS on Mondays. Ex-QAO now is K4AQQ. VYH is a new Burlington ham just out of the Army. LCX is getting on 2 meters. NGS reports that Ft. Dodge now has 49 paid members. BQC/θ along with IVS/θ and WN0UNC, is trying to

get a ham club going at Luther College. LGG has a new Collins 32V-3. TVC reports most of his activity is on 2220 and 4020 kc. on MARS and 1815 and 3970 kc. KWT and HWU have been holding weekly radio classes. THU is a brand-new father. SFK got his Conditional Class license Oct. 22nd. The reporting was swell this time. Keep it up, fellows. Traffic: W0SCA 1124, CZ 257, LJW 106, BLH 35, KVJ 31, KJN 30, QVA 22, LCX 20, NGS 19, JTF 18, SFK 16, W9BQC/θ 14, W0DDV 12, RMG 12, EHH 11, LGG 10, TVC 7, HWU 6, NYX 3, PAN 1.

**KANSAS** — SCM, Earl N. Johnston, W6ICV — SEC: PAH, RM: KXL/NIY, PAM: FNS. The Scott County RACES Plan has been approved with ZUX as Radio Officer and YLO as CD Director. The Topeka-Shawnee County c.d. area hams are organizing a 2-meter net on 145.5 Mc. ONF, of Howard, plans to start a code practice schedule Mon., Wed., and Sat. at 1730 on 3805.5 kc. EOT plans to help part time. The Lawrence Emergency Net meets each Sun. at 1400 on 3820 kc. K0FED is a new National Guard station at Concordia with a Viking II, VFO, and NC-125 receiver, according to KSY, and will be active in the Air Force MARS nets as well as other amateur activity. VGA is a new station in Mulvane. Bob uses a Viking Ranger with a vertical antenna to put out that FB signal. LBJ, who is working on a new 600-watt rig, took time to participate in the CD Party working 10 sections. MOX, of Lawrence, keeps daily skeds with EMS in Adair, Iowa, on 2 meters. Louis has six states on 2 meters and is open for skeds with anyone anywhere. WIZ, of Emporia, is new Asst. EC for the Neosho Valley Amateur Radio Club at Emporia. UAT, of Fort Scott, is building a new 250-watt rig. Thanks, fellows, for your support in the SCM election. We hope to do bigger and better things for the section in the next few years. Traffic: (Oct.) W0BLI 566, NIY 331, OIH 138, EOT 137, WGM 107, TOL 94, FDJ 85, MNG 84, MLG 51, ECD 45, NFX 41, FEO/θ 35, QMU 33, MAJ 32, UMV 26, ABJ 22, SVE 22, ONC 21, ONF 21, AAJ 20, LOR 19, HS 17, DEL 16, UAT 16, LIX 15, KFS/θ 12, LBJ 10, RBO 9, ICV 8, KAJ 8, NLV 8, TNA 8, YFE 8, SEP 7, TSR 7, YOS 7, QGG 6, VRZ 6, LOW 4, LQX 4, (Sept.) W0EOT 138.

**MISSOURI** — SCM, Clarence L. Arundale, W0GBJ — SEC: VRF, PAM: BVL, RMs: OUD, QXO. Missouri lost one of its most active old-time hams when CRM recently passed away. CPI handled a large volume of traffic originating in the area affected by Hurricane Hazel. OUD advises that MON is meeting at 7:00 a.m. in addition to the regular evening net schedule time because of present skip conditions. WYJ/4 has received his ticket and will be at home in St. Louis in April. BZK has earned his 1,000 Traffickers Club certificate. ORP and GFF are located at the Ardmore AFB. SZT now has a 75A-2. TDF has a Viking II and SX-71 in operation. WN0VPM uses an Eldico TR-75TV and HQ-140X. S.E.T. activities were reported by HUI and FKM. CPI raised his doublet to fifty feet. Bad skip conditions on 40 meters kept GAR's traffic total down. FLN reports 25 members are taking code classes in preparation for their Novice Class examination. K0FBO is installing a Johnson 20-meter beam. The radio club at Southwest Missouri State College, with LQC as trustee, has applied for a station license. IJS recently visited CKQ to pick up a few pointers on the new 813 rig that IJS is building. We hear that CKQ recently received an A-1 Operators Club certificate. DOA has a 10-watt s.s.b. exciter that works out in fine shape. MUX recently completed his new rig which runs 450 watts to an 813. JUY did a beautiful job in constructing the all-band 2E26 rig recently described in QST. AKS still has audio "bugs" troubling him. Traffic: (Oct.) W0CPI 927, QXO 501, GAR 240, BVL 175, CKQ 55, EBE 39, KIK 30, HUI 29, OUD 27, KA 24, GBJ 21, BKV 20, RTW 18, QWB 12, BUL 10, CXE 4, FLN 4, QBX 4, QNF 4, TGC 4, BZK 2, ETW 2, TCF 2, ZWI 2, (Sept.) W0BVL 59, QNF 6.

**NEBRASKA** — SCM, Floyd B. Campbell, W0CBH — Asst. SCM: Tom Boydston, 0VYX, SEC: JDJ, PAM: EUT. The North Platte Club now has a call, W0WYM. The transmitter will be located upstairs over the County Sheriff's office. The SCM suggests that appointees check certificates and get them in for endorsement. EXP has a 20A exciter and is figuring on 811s for the s.s.b. final. IJK is rebuilding his s.s.b. for 300 watts. RIG has the 4-65A working fine. RIG has a new 7-lb. 8-oz. YL. CBH built the 50-kc. frequency standard in July STQ. AQJ gets nice reports with his new B. & W. 5100. JCK has moved to Albuquerque, the land of mobiles. QMD is using a WRL Globe King. QMW is using 40-meter vertical. QOU, PHW, VKQ, and AIY are heard on 2 meters. A 2-meter net for Nebraska is shaping up with 145.35 Mc. as the frequency. State-wide coverage is almost assured. The frequency was picked to be in the RACES portion of the band. NET has stacked a TV antenna on his 65-ft. 10-meter beam. ERM had such good results with his flea-power mobile recently that he has given up the idea of more power (mobile). VQR is president of the Tri-City Radio Club at Scottsbluff. QKR is vice-president. IRW and FTQ are members of AREC. UOV is NCS for the North Platte Club Net. Traffic: W0TQD 1836, K0AIR 1314, W0FQB 230, ZJF 230, FTQ 51, AEM 49, MAO 38, IITA 35, KDW 25, VYX 23, EQG 16, ORW 14,

## Eimac designed,\* Eimac produced ...for Eimac QUALITY

Included in the incomparable list of Eimac developed electron-power tubes, which range to 9600mc and 25 kw power output, are six favorites of Amateur Radio Operators. Application-proved in many types of commercial and military service, the 4-65A, 4-125A, 4-250A, 4-400A and 4X150 radial-beam power tetrodes and 4E27A radial-beam power pentode possess the inherent features of Eimac multi-grid tubes—high power gain, minimized neutralization needs, and on-the-air economy. Mobile or shack, 2mc or 420mc, CW or phone, there's a tube in the Eimac Amateur's Big Six to do the job for you with a wallop. When visiting your distributor ask for Eimac—the mark of excellence in electron-power tubes.

Write our Amateur Service Bureau  
for further information.

# PRECISION MODEL 120

GIVES YOU WHAT YOU WANTED IN A  
**HIGH SENSITIVITY  
MULTI-RANGE TEST SET**

- ✓ MORE RANGES
- ✓ AN EXTRA-LOW RESISTANCE RANGE
- ✓ AN EXTRA-LOW VOLTAGE RANGE
- ✓ AN EXTENDED LOW CURRENT RANGE
- ✓ A LARGER METER SCALE FACE
- ✓ POSITIVE CONTACT JACKS and PLUGS

Compare These Wide Spread Ranges and Features:

- ★ 8 DC VOLTAGE RANGES: 20,000 ohms per volt.
- ★ 8 AC VOLTAGE RANGES: 5,000 ohms per volt.  
0-1.2-3-12-60-300-600-1200-6000 volts.
- ★ 8 AC OUTPUT RANGES: same as AC volt ranges.
- ★ 7 DC CURRENT RANGES:  
0-60-300  $\mu$ a. 0-1.2-12-120-600 Ma. 0-12 Amps.
- ★ 5 RESISTANCE RANGES: self-contained  
0-200-2000-200,000 ohms. 0-2-20 megohms.
- ★ 8 DECIBEL RANGES: -20 DB to +77DB.  
0 DB = 1 Milliwatt, 600 ohms.
- ★ EXTRA LARGE 5 1/4" RUGGED 'PACE' METER:  
40 microamps sensitivity, 2% accuracy.
- ★ 1% MULTIPLIERS and SHUNTS
- ★ TWO JACKS SERVE ALL STANDARD RANGES
- ★ "TRANSIT" SAFETY POSITION on range selector protects meter during transport and storage.
- ★ CUSTOM-MOLDED PHENOLIC CASE and PANEL

MODEL 120... complete with internal ohmmeter batteries, banana-plug test leads and detailed operating manual. Overall Case Dimensions 5 3/8 x 7 x 3 3/8"

## NEW ENGLAND DIVISION

**CONNECTICUT** — SCM, Milton E. Chaffee, W1EFW — SEC: LKF, PAM: LWW, RM: KYQ, MCN and CN 3640, CPN 3880, CEN 29,580 kc. RAN got home from W.P.I. for the CD Party and has added a beam for 14 Mc. UBM, daughter of EBO, married YOC in September and ham radio was the factor that brought them together. CHX is ex-4TGO, now active from West Hartford. UJG has abandoned 220 to concentrate on 144 Mc. NFG reports a successful "Operation Goblin" as a Hamden Halloween c.d. exercise. Current officers of the Bristol Radio Club are VOV, pres.; ZFH, treas.; and YOY, secy. The Southington Amateur Radio Assn. was organized in October with GVT pres.; ZZZK, vice-pres.; GVZ, secy.; ZTQ, treas.; and SBI, activities. New ECs: OGQ and RMG for Waterbury and New Haven. ORS renewals: RWS, QJM, and KV. EC renewal: RFX. LWW reports for CPN: 101 stations participated with ZFF, LIG, VWL, MLT, and DAV most active. MNF has gone s.s.b. AWV now has General Class ticket and is active on 2- and 10-meter mobile. RRE is much better after a long illness. COB is active again with a Viking. Welcome to ex-3EDA, 9ADE, now active in West Hartford as 1EDA. APA snagged HK0AI for country No. 30 on 40-meter 'phone. WPO now is DXCC. We regret to note FWII now is a Silent Key. NJM enjoys mobile c.w. BDI hit BPL this month largely from the RTTY Net. GTH and ZZZK are on 420 Mc. RBF is rebuilding for a pair of 6146s in the final. WNICKA is building up practice on 40 meters. VOS and VOV attended the W4 YL picnic in Virginia. TD transmits Official Bulletins on 146 Mc. CN handled 300 messages in 22 sessions, according to RM KYQ, with a high of 36 in one night. KYQ, RGB, and LV are high in QNI. MCN handled 88 in 21 sessions with IBE, YYM, and RFJ sharing QNI honors. CTN, just under-way, has adjusted schedule to Sun. morning, with RFJ and HYF doing the NCS work. New Net certificates went to FMU, FTM, LWW, MLT, RMZ, VWL, DAV, KGT, VOV, UED, HUM, and YUP. Everybody set for the FCDA radio test in Region 1 in February? Thanks for the many reports; keep 'em coming. Traffic: WIAW 309, CUH 268, YBH 198, KYQ 154, BDI 132, LIG 90, NJM 87, HUM 82, HYF 73, RGB 58, QJM 56, YU 47, YYM 43, VOS 38, LV 37, BV3 33, EFW 33, FTM 28, RFJ 25, KV 19, VOV 19, UED 16, APA 6, EDA 2.

**MAINE** — SCM, Bernard Seamon, W1AFT — SEC: BYK, PAM: WRZ, RM: OHT. The Sea Gull Net meets at 1700 on 3960 kc. Mon. through Fri.; the Barryard Net at 0730 on 3960 Mon. through Fri.; and the Pine Tree Net at 1900 on 3596 kc. Mon. through Fri. Recent OPS appointees are WTG, LYR, UDD, and WRZ. Ex-IXIXE is back on in Damariscotta with a new call, BWI. BX has worked seventeen countries with his underground antenna, using 35 watts input. ZNL is in the veterans hospital at Togus for a check-up. TWR is in the CMG hospital at Lewiston for an operation. Latest report is that both are doing well. LHA is off for his annual cruise in southern waters with the Maine Maritime Academy Training Ship. He is the radio officer. Our new PAM is going great guns and is keeping your SCM busy issuing OPS and Section Net certificates. What is with you and the Pine Tree Net, OHT? We miss your usual fine reports. BPI has his Donald Duck working. The BBC has been coming in right well on 3960 kc. during Sea Gull Net time. The music is very pretty blended with the cries of the wild gulls. Your SCM and his YL wish you all a Happy New Year. Traffic: W1WTC 220, LKP 131, UDD 38, TVB 32, YVW 18, AFT 17, LYR 15, BTY 14, LHA 13, BX 12, EFR 11, UOT 11, VYE 9, WRZ 9, ZBN 9, NXX 7, YTE 7, RSC 5, LOA 3.

**EASTERN MASSACHUSETTS** — SCM, Frank L. Baker, Jr., W1ALP — New appointments: WLU as EC for Watertown, NF as OBS, BPW as OBS. Appointments endorsed: ATP Holliston, AVY New Bedford, HJ Dover, MON Stoughton, UBB Boxford, QOL Lynn as ECs; AVY and HUP as OPSs; AVY, BDI, ENG, and EPE as ORS; ALP and UIR as OBSs; QWQ as OES; UE as RM for 80-meter c.w.; TVZ, Hopkinton, as EC. Please add to your list of nets the Braintree Emergency Net on 28,560 kc. Mon. at 2100, and change the frequency of Weymouth and Holbrook to 28,580 kc. TF3CJ is attending MLT, and took part in the recent F.M.T. along with PXII and LQQ. GAG's XYL won an SX-88 receiver at the New England Division Convention. AKN moved to Sandwich. A Region 5 committee meeting was held with DFS, BL, RM, TQP, KTG, NJN, ALP, ZYX, and CQ present. A Sector 5 meeting was held with GNL, GOF, FWS, SH, UXN, MME, THY, SMV, ISU, EKG, ALP, and MD present. K2BJB/MM is on 10 meters in Boston Harbor. The Braintree, Weymouth, and Quincy mobiles were out on Halloween with the auxiliary police. Heard on 2 meters: CAV, YTB, and LXR. Heard on 40 meters: FED, VAL, AL, BEV, VPP, CNG, UKG, TWN, EYP, AYN, KIX, ALX, TFD, ABJ, BJT, MNW, QNC, LIU, and YKD. Mobile

# MALLORY HAM BULLETIN

## MALLORY 6-Volt Battery Charger Keeps Mobile Unit on the Go

Those of us who have tried mobile operation are fully aware of the very difficult problem of how to keep the car battery charged adequately for starting purposes, and still provide plenty of juice for a reasonable amount of time on the air.

Recently, one of our good amateur friends, who is a red-hot mobile fan, told us of a method he used for keeping his battery at top performance and still add no extra equipment to his automobile. His system sounded so practical, that we'd like to pass it along.

Here is what he did. First, he visited his Mallory distributor and bought a small, inexpensive Mallory 6-volt Battery Charger (the 6SAC6 or 12SAC5 for 12-volt systems) together with a special automobile Cigarette Lighter Plug (Mallory R675) to be used for inserting the Charger output into the electrical circuit of his car. The Lighter Plug was attached to the Battery Charger and the

whole business was then mounted conveniently in his garage.

After an evening of mobile operation, he simply inserted the Plug into the cigarette lighter socket, turned on the 117 VAC line, and the next morning, presto, his battery was ready for heavy starting action.

With this very convenient arrangement, this ham was able to operate his mobile rig the year 'round, with little fear of even tough wintertime starting.

Incidentally, if your car is not equipped with a cigarette lighter, don't let that handicap you, simply ask your distributor for a Mallory Dashboard Receptacle (R652) which may be clamped to the dashboard without drilling a single hole. Used in conjunction with a Cord Assembly (R670) this arrangement will provide all the convenience afforded by the lighter plug method of installation.

# LOOKING FOR DX?

GET A

## GOTHAM BEAM

and work the world!

Reports tell the story of GOTHAM BEAM performance—the gang says you can work more DX in a day off a GOTHAM BEAM than in a year off a wire or dipole. GOTHAM BEAMS are strong, too; easy to assemble and install, no special tools or electronic equipment necessary; full instructions included, matching is automatic; maximum power gain built into the design—AND ALL AT LOW, LOW, PRICES.

NEW! NEW! NEW!

### 2-Meter Beam Kits

GOTHAM proudly presents a 6 element Yagi beam for 2 meters at only \$9.95. Contains a 12 foot boom, 1" alum. tubing; 3/8" alum. tubing for elements; Amphenol fittings; all hardware, and instructions. Vertical or horizontal polarization, terrific performance!

And GOTHAM's new 12 element Yagi for 2 meters at only \$16.95! Contains a 12 foot boom, 1" alum. alloy tubing; 3/8" tubing for elements; all Amphenol fittings; all hardware, and instructions. Vertical or horizontal polarization, multiplies your power by 32!

### 10 M. BEAMS

**S103T • Std. 10m 3-El. T match, \$18.95.** 1—8' Boom, 3/4" Alum. Tubing; 3—6' Center Elements, 3/4" Alum. Tubing; 6—6' End Inserts, 3/4" Alum. Tubing; 1—T Match (4'), Polystyrene Tubing; 1—Beam Mount.

**D103T • DeLuxe 10m 3-El. T match, \$25.95.** 1—8' Boom, 1" Alum. Tubing; 3—6' Center Elements, 1" Alum. Tubing; 6—6' End Inserts, 3/4" Alum. Tubing; 1—T Match (4'), Polystyrene Tubing; 1—Beam Mount.

**S104T • Std. 10m 4-El. T match, \$24.95.** 1—12' Boom, 1" Alum. Tubing; 4—6' Center Elements, 3/4" Alum. Tubing; 8—6' End Inserts, 3/4" Alum. Tubing; 1—T Match (4'), Polystyrene Tubing; 1—Beam Mount.

**D104T • DeLuxe 10m 4-El. T match, \$30.95.** 1—12' Boom, 1" Alum. Tubing; 4—6' Center Elements, 1" Alum. Tubing; 8—6' End Inserts, 3/4" Alum. Tubing; 1—T Match (4'), Polystyrene Tubing; 1—Beam Mount.

### 15 M. BEAMS

**S152T • Std. 15m 2-El. T match, \$22.95.** 1—12' Boom, 1" Alum. Tubing; 3—12' Center Elements, 3/4" Alum. Tubing; 2—5' End Inserts, 3/4" Alum. Tubing; 2—7' End Inserts, 3/4" Alum. Tubing; 1—T Match (6'), Polystyrene Tubing; 1—Beam Mount.

**D152T • DeLuxe 15m 3-El. T match, \$33.95.** 1—12' Boom, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 2—5' End Inserts, 3/4" Alum. Tubing; 2—6' End Inserts, 3/4" Alum. Tubing; 2—7' End Inserts, 3/4" Alum. Tubing; 1—T Match (6'), Polystyrene Tubing; 1—Beam Mount.

### 20 M. BEAMS

**S202N • Std. 20m 2-El. (No T), \$21.95.** 1—12' Boom, 1" Alum. Tubing; 2—12' Center Elements, 1" Alum. Tubing; 4—12' End Inserts, 3/4" Alum. Tubing; 1—Beam Mount.

**T202T • Std. 20m 2-El. T match, \$24.95.** 1—12' Boom, 1" Alum. Tubing; 2—12' Center Elements, 1" Alum. Tubing; 4—12' End Inserts, 3/4" Alum. Tubing; 1—T Match (8'), Polystyrene Tubing; 1—Beam Mount.

**D202N • DeLuxe 20m 2-El. (No T), \$31.95.** 2—12' Booms, 1" Alum. Tubing; 2—12' Center Elements, 1" Alum. Tubing; 4—12' End Inserts, 3/4" Alum. Tubing; 1—T Match (8'), Polystyrene Tubing; 1—Beam Mount.

**D202T • DeLuxe 20m 2-El. T match, \$34.95.** 2—12' Booms, 1" Alum. Tubing; 2—12' Center Elements, 1" Alum. Tubing; 4—12' End Inserts, 3/4" Alum. Tubing; 1—T Match (8'), Polystyrene Tubing; 1—Beam Mount.

**S203N • Std. 20m 3-El. (No T), \$34.95.** 1—12' Boom, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 6—12' End Inserts, 3/4" Alum. Tubing; 1—Beam Mount.

**S203T • Std. 20m 3-El. T match, \$37.95.** 1—12' Boom, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 6—12' End Inserts, 3/4" Alum. Tubing; 1—T Match (8'), Polystyrene Tubing; 1—Beam Mount.

**D203N • DeLuxe 20m 3-El. (No T), \$46.95.** 2—12' Booms, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 6—12' End Inserts, 3/4" Alum. Tubing; 1—Beam Crosspiece, 1" Alum. Tubing; 1—Beam Mount.

**D203T • DeLuxe 20m 3-El. T match, \$49.95.** 2—12' Booms, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 6—12' End Inserts, 3/4" Alum. Tubing; 1—T Match (8'), Polystyrene Tubing; 1—Beam Crosspiece, 1" Alum. Tubing; 1—Beam Mount.

on 10 meters: UCP, RBA, LXZ, KZW, RES, OHB, ZPI, QLB, TTS, and YMV. WNICRO is a new ham in Quincy, KLC is on 2, 6, and 10 meters. New Novices: CAF, CAS, CDR, CNW, CPQ, CPW, CQB, CQC, CQE, CQL, and CSP. Tech. Class: WQII and YRI. Other new hams: BTX, AAV, and CPP. BJW has General Class license and added 2E26 to the rig. MKW reports a Cape Cod 10-meter Net on 28.9 Mc. with VTX, FQK, YXJ, YQT, UMC, DVS, BLM, ONK, ZLIC, and BMW on 160 meters. BPA, ex-3FAU and SZNQ, now is in Aetna and will be on with a Viking Ranger. The Braintree Radio Club held a meeting and a discussion on a 2-meter net. Radio Amateur Open House held a meeting at the Cambridge YMCA with a talk by CFW. ZVI is the call of the Pequotsette ARS in Watertown, ALP has his Viking II kit going and is on 10 meters. WPV is all-mobile operation and is on MARS and other nets. VTT has a new NC-125. MKW reports the following on during the storms on the 2-meter Net: MFL, BCN, ARC, CFQ, MKW, MBQ, PMIC, BLM, JN1, DJK, WMIN, MNF, OMQ, LYV, WHC, TQS, BFI, AQY, UCM, GRC, OH, LNR, TZ, WNS ZSJ, ABQ, and AQN. UYT has new 10-meter ground plane. VTZ has co-ax for 10 meters on the roof. BLM has a Viking Ranger. BLM is on 144 and 230 Mc. JN1 has mobile Elmac. BGW is on RCTY most of the time, and worked DL4RO on 20 meters. RCTY is on 2, 6, and 10 meters and his wife, ZEN, also is on. OSS is on 20, 40, and 80 meters. The License Plate Committee of the South Shore Club is going into action. TVF is in Germany with the Army. AKN's son, VPTN, is on 20 meters. New officers of the Waltham ARA, MHL, are NXX, pres.; QMN, vice-pres.; 2BV, secy.; HIRV, secy. of the Wellesley ARS are FFO, pres.; IRR, vice-pres.; OQP, treas.; WGM, secy. SS gave a talk on "Proper Procedure within the Operations of an Emergency Net" at the last meeting. The Malden ARA held an auction with HKG auctioneer. Sorry to report the death of QPR, trustee of BWU. The T-9 Radio Club held a meeting at WNK's, AZU has an antenna farm location. ZPE is teaching his XYL the code. CNT has TBS-50D and HQ-129X. CDO is awaiting a Ranger transmitter. BND has an Elmac rig. PJ, Everett EC, reports that TNI was on during the storm using gas power with walkie-talkies and mobiles BHD, YTD, JIXY, KNA, SXH, RLF, and VXE. TJW, Falmouth EC, reports that during Hurricane Hazel the net was on with QLT, LYV, DVS, UXG, and TJW, with WNM, the club station, as NCS. BB is getting ready for the 160-meter DX tests. BPW is working on Yagi beam and is on 2 meters. The Falmouth Amateur Radio Club has a training program going on at the Recreation Bldg., Wed. at 8 p.m. New members are CCR, AIV, UXH, CMT, and DJK. The Winthrop drill had BDU, CMW, DJ, OIR, MQB, BOX, BB, and XYLS on the air. VIS is busy on the crystal units for their TR4s. BOX is running a code class. PYK and YZP are on 10 meters. Traffic: (Oct.) WUOK 535, EPE 144, EMG 67, AVY 56, UE 42, IBE 32, QLT 32, VTT 25, NUP 10, TY 9, WU 9, WPW 6, BY 4, UTH 3, AHP 2, DWO 2, LLY 2, (Sept.) WUNUP 38, UE 34, IBE 32, BGW 13, ZDQ 4, AHP 2, EMG 2, (Aug., Sept.) WIMWK 26.

**WESTERN MASSACHUSETTS**—SCM, Roger E. Corey, WIJYH—RM: BVR. WNM meets at 7 p.m. EST Mon. through Fri. on 3560 kc. New officers of the Hampden County Radio Assn., Inc., are KUE, pres.; IIRV, vice-pres.; VNE, treas.; and UKR, clerk. RAD, AAY, MVF, and PCQ were elected directors. Proud new owners of Viking Rangers in the Springfield Area are TTL, OBQ, and MNG. JRA will maintain Official Bulletin schedules on 3555 and 3830 kc. daily. For times drop a card to JRA at Amherst College or to the SCM. EFQ has a new tower with a 10/20-meter rotary ready for the DX Contest. UVI conducts a code class twice weekly at his home in Westfield. Any prospective hams who are interested may contact him. The October CD Party produced a record turnout in Western Massachusetts with ABD, YXV, VEC2KC, TVZ, WDW, SRM, ZIO, HRC, JYH, WEF, W2AKJ/WI, CJK, RRR, KFY, WCC, YCG, and AMI taking part. WDK is operator at MARS station KIWAU and has a new Elmac AF-67 at his home station. BVR spoke at the New England Division Convention held at Manchester, N. H. This is my last column as SCM. Your new SCM is Art Zavarella, MNG, 1702 Main St., Agawam, Mass. I would like to thank those who contributed to this column during the last two years and especially BVD, BVR, COL, TVJ, and TAY, who reported every month without fail. My special thanks also to the many throughout the section who gave so much of their time to support ARRL activities in the public interest and in every phase of the hobby. I know you all join me in promising Art the same cooperation that I have had and in wishing him the best of success. Traffic: K2BCB/1445, WUOK 372, WAG 84, HIRV 79, BVR 66, WCC 34, XING 28, UVI 25, TAY 19, WDK 14, PRX 12, WDW 11, JYH 9, ABD 7, YXV 5, OBQ 1, TVJ 1.

**NEW HAMPSHIRE**—SCM, Harold J. Preble, WHIS—SEC: BXU. RM: CRW. Asst. RM: TBS, PAM, AXL. At the request of the new SCM, HHS, GMH is writing this month's report as HS has just been elected and has not had time to get started. All the best to you, Hal. WUU is NCS for the TCPN on Saturday nights. He has the rig formerly owned by GMH with S13s in the final. The Concord Brass

## 3 VALUABLE INSTRUMENTS IN 1

- Dummy Load
- R-F Watt Meter
- SWR Bridge

Here in one attractively finished unit, is a versatile, completely self-contained instrument with features enabling you to make fast and reliable measurements on Coaxial Feed Lines, Antennas, and Transmitting Equipment.

The Matchmaster is the answer to your matching problems and a precision guide. It eliminates all former hit and miss methods—assuring top performance from your equipment.

An integral R-F Bridge and Calibrated Panel Instrument provide a visual means of determining correct adjustment to Coaxial Type Feed Lines, Antenna Tuning Networks, Beams and Mobile Whip Antennas—For Maximum Efficiency and Minimum SWR.

The Calibrated R-F Wattmeter simplifies tuning of all r-f stages and enables proper adjustment of circuit elements and voltages for Maximum Power Output up to 125 watts and higher powers by sampling methods.

A built-in non-Reactive Dummy Load enables you to perform numerous Tuning and Adjust-

ment Tests—without Putting a Signal on the Air.

Now you can make all of these highly important measurements and tests with this one instrument. The results will amaze you and you'll wonder how you ever got along without a Matchmaster.

### SPECIFICATIONS

Dummy Load—SWR-1.2:1 or better from DC to 30 MC.

R-F Wattmeter—Useable Frequency Range—  
From 500 KC to 30 MC.

Power Rating—100 Watts Continuous—125 Watts Intermittent.

Panel Instrument Scale—Calibrated to read  
R-F Watts and SWR.

Cabinet Finish—Blue Hammertone.

Model 650—52 ohms

Model 651—75 ohms

**Price \$47.50**

# Modernize with **TRIPPLET** meters

**A Size, Type, and Style  
for Every Installation**

Your instrumentation is strictly modern in design and construction with Triplet Meters. You can have sizes 2" to 7" in a wide variety of case shapes and mounting arrangements, A.C., D.C., R.F., Rectifier or Dynamometer. Molded and metal cases, rear illumination, and other special features are available. For precision and economy virtually every meter part is made in Triplet plants under rigid humidity and dust control. Every meter represents the refinements gained in half a century of meter experience. Keep your panels up-to-the-minute with Triplet Meters—famous the world over for quality, accuracy, and dependability.

# TRIPPLET

TRIPPLET ELECTRICAL INSTRUMENT COMPANY • BLUFFTON, OHIO, U.S.A.

Pounders held an enjoyable Halloween Party at the Kettle and Crane House in Boscawen, N. H. PTB received honorable mention in the local paper for keeping the c.d. personnel well informed of the progress of Hurricane Edna. YVK has a new 32V-3. TRM is having fun on 40-meter 'phone. WUG has an Elmac A67 and says it is FB. UNV gets to use the Marine station, K4MC, to QSO back home. We welcome BYD to New Hampshire from Pennsylvania. Glad to see PFU has recovered enough from his fractured hip to discard his crutches. 9BQC wants schedules with New Hampshire stations to complete WAS during the Christmas holiday. Write to him at 2811 Custer Ave., Rockford, Ill., if you can help him out. Traffic: (Oct.) W1WUU 54, GMH 50, COC 36, QGU 26, FZ 7. (Sept.) W1QGU 22.

**RHODE ISLAND**—SCM, Walter B. Hanson, jr., WIKKR—SEC: MIJ. RM: BT. RIN meets Mon. through Fri. at 7 P.M. EST on 3540 kc. Meet the gang Sundays at 11 A.M. on 1890 kc. This 160-meter net is growing fast and is the best we've had yet. JFF, YAO, and WN1AYZ did a great job providing communications for the sport car time races at Newport. AYZ's new Gonset at the finish complemented JFF's home-built at the start. In an attempt to learn just how the various towns on Aquidneck Island could perform together when we have our next hurricane, BBN Portsmouth, ULS Tiverton, and JFF Newport acted as control centers on a combined 2-meter 10-meter fixed/mobile test. 4TSD/1, 4CVO/1, ZUX, and ZUL were the mobile end of the team. All the control centers were operated on emergency power. TRX, ZJQ, YAO, YAP, and MMX monitored the test. The NAARO's bean supper and auction on Nov. 4th was attended by about 125 Rhode Island hams. A very welcome letter was received from ZXA which will be turned over to KKR for next month's report. JBB, with the writing of this report, completes his tour of SCM duty and wishes KKR a prosperous two years. Please help KKR as much as you have JBB. Traffic: (Oct.) W4CVO/1 33, W1FDS 8, YAO 8. (Sept.) W1VXC 127, ULS 115, YAO 66.

**VERMONT**—SCM, Robert L. Scott, W1RNA—SEC: SIO. PAM: RPR. RM: OAK. Vermont nets: VTPN 3860 kc., 0930, Sun. only; VTN, 3520 kc., 1900, Mon. through Fri.; GMIN, 3860 kc., 1200-1300, Mon. through Fri.; Vt. C.D. 3993 and 3501.5 kc., alternate Sun., 1000. Several XYs of the Burlington boys are active on Novice frequencies. Is that why we seldom hear the boys from that area on 75 meters? The news comments around the State seemed to have faded out before reaching this QTH, so—Traffic: W1OAK 126, AVP 85, RNA 69, IT 24, VZIE 14, TXY 6, UGW 1.

## NORTHWESTERN DIVISION

**ALASKA**—SCM, Dave A. Fulton, KL7AGU—AOW, formerly of Anchorage, now is looking for KL7 QSOs from home with the call W4BFO. ABT expects to depart for W7-Land early in '55. AWB still is looking for a DXCC prior to his departure sometime in '55. Many KL7s in the Anchorage Area expect to go s.s.b. on all bands in the near future. BEW has worked eight maritime mobiles on 15 meters; she also has 29 states confirmed for her WAS and sure is working hard to get the balance. CP has tied a Viking Ranger to his squashed rhombic and it sounds mighty fine. The Anchorage Amateur Radio Club held an election and the lineup for '55 is as follows: AOT, pres.; ATL, vice-pres.; BHE, secy.; BDU, treas.; PIV, act. mgr. The long-awaited c.d. radio gear has arrived and is in the process of being placed now and should be in operation before too many more months. Traffic: KL7AWB 18.

**IDAHO**—SCM, Alan K. Ross, W7IWU—Twin Falls: NH is busy with PAN trying to find some volunteers with high power for NCS. Kellogg: RQG is the new Emergency Coordinator for Shoshone County. Gifford: VWS is applying for ORS appointment. Lewiston: ONP has his mobile installed in the new Oldsmobile. OOV has recovered after spending four days in the hospital. WN7VIO is looking for some new crystals since he took the Conditional Class exam in October. From hamming radio to Hammond organ is OOW's range. The Lewiston and Boise gang helped the police on Halloween. Boise had a 2-meter link to 10-meter mobile stations. Caldwell: EYR now has a Viking II and is putting up a 20-meter beam. Preston: RKI is active as Official Observer. Boise: GVN is back with us now after 6½ years in Africa. Two meters is active again with a station at the KBOL-TV site, up 7000 feet. Traffic: (Oct.) W7NII 113, RQG 66, RSP 34. (Sept.) W7VWS 6.

**MONTANA**—SCM, Leslie E. Crouter, W7CT—The Great Falls Radio Club is starting a training program in theory and code. WIF and RIL are on 420 Mc. RRI is on mobile. QPK returned to school in California. UWN is on s.s.b. RIL moved across town. JRG rebuilt the s.s.b. exciter and 813 linear final. SFK is building a ham shack. SFK and TGF are NCS for the North Montana 160-meter 'phone net operating on 1995 kc. at 1900 MST. Laurel reports the Simulated Emergency Test was witnessed by the local Red Cross and newspaper representatives. TTC and RDM built new VFOs. SMY and UXA are rebuilding transmitters. LER, JFR, CJN, LNS, LNU, OIO, and CDW, all Butte mobile stations, operated a mobile relay chain (Continued on page 94)

The CD-2 is a combined 2 meter crystal controlled transmitter and double conversion super heterodyne receiver. It is designed for CD fixed and emergency operations, and is engineered to meet all the rigid specifications of the FCDA. The CD-2 is a rugged, quality constructed unit, dependable for the serious work of CD — ideal for just pleasant QSO'ing on two. Compare these fine outstanding features . . .

- **110 VAC AND 6 VDC OPERATION**
- **RCVR SENSITIVITY: 0.5 MICROVOLTS**
- **IMAGE REJECTION: 60 db**
- **HARMONIC SUPPRESSION: 60 db**
- **8 CRYSTAL CHANNELS**
- **NO MULTIPLIER TUNING REQ. (FACTORY SET)**
- **6252/AX9910 P.P. FINAL**
- **PLATE MODULATED**
- **ANTENNA INPED.: 32 - 72 OHMS**
- **PROVISIONS FOR COMPLETE REMOTE CONTROL**
- **PUSH-TO-TALK OPERATION**
- **AVAILABLE FOR 6 METERS (CD-6)**

between Butte and Helena during the Simulated Emergency Test. FUB checks in regularly on Montana and South Dakota c.w. nets. NZJ checks into the North Montana and South Dakota 160-meter 'phone nets every day. CT sends ARRL Official Bulletins Mon. through Fri. on 3520 kc. at 1830 MST. Recent endorsements or appointments: RSJ, FUB, and DSS as EC; NSJ, PCZ, and TDW as OPS; SFK as OO, Traffic; W7CT 56, CJN 32, LBK 28, FUB 14, SMT 7, TTC 5, NZJ 3, QGJ 2, RDM 2, IRN 1.

**OREGON** — SCM, John M. Carroll, W7BUS — OJA now believes that roller skates and radio do not mix and has a broken leg to prove it. SBT uses a bicycle mobile. ISP is new Medford Area EC. IEY is visiting clubs on the Coast speaking on MARS. HUI is out of the hospital and back on the air. JHA has retired from the Navy and plans to spend the rest of his life hamming. WAT is new Asst. ESC and is ORS and OPS for Oregon. QFY and the OARA planning committee are working on the convention to be held in Portland May 7 and 8, 1955. KTL finally got a one-eyed monster. IIDN and NSD are the same fellow. The Teenagers Net in Oswego is going along fine. UAB has WAS. RVN is teaching code classes for the OARS. TNF is a CAP communications officer. NWE finally is planning on s.s.b. SY and family have moved to Salem. AZP and KR have been hunting elk. TVW was reelected president of the Pendleton Radio Club. FFD has turned brick-layer and is building a fireplace. VCII has a new jr. operator. The Cascade Net on 29.2 Mc. had 425 check-ins, with PRU as high check-in station for the month. The Oregon State Net had 24 sessions with a total attendance of 203. The whole net is out for AREC with a c.w. net for AREC stations. Traffic: (Oct.) W7APF 553, WAT 93, ESJ 74, AJN 52, LZG 51, QEI 50, TBT 49, THX 42, PRA 41, WLL 13, IIDN 11. (Sept.) W7HDN 19, KTL 6.

**WASHINGTON** — SCM, Victor S. Gish, W7FIX — The Richland Amateur Radio Club, Inc., meets the 2nd or 3rd Mon. at the QTH of OHS at 8 p.m. Officers are NLI, pres.; RMQ, vice-pres.; KIIJZ, secy.; RJO, treas. The Tacoma Amateur Radio Society meets the 1st and 3rd Fri. at South Park Community Center at 8 p.m. Officers are SOL, pres.; ETX, vice-pres.; GVV, secy. The Radio Club of Tacoma, Inc., meets the 2nd and 4th Wed. at the Red Cross Bldg., 7th & Broadway, at 8 p.m. Officers are AZI, pres.; RNS, vice-pres.; OVW, secy.; QPM, treas. Tacoma's RACES plan has been approved by FCDA and now is in the hands of FCC. EVW and OS attended the Puget Sound RTTY meeting at the QTH of KV. Bremerton Club members attended a Tacoma Club meeting at which there was a discussion of call letter license plates. UYK is mobile with the Babcock transmitter he won. MFG had to unwind his antenna after a recent windstorm. JHX is on 441.36 Mc. video; also the Puget Sound 2-meter Net, 145.8 Mc., at 8 p.m. Mon. UQY submitted an FB 40-meter OO report. 6REF/7 now is at Redmond. Welcome back to the section. Betty! FRU, BA, and PGY made BPL again. PGY is displaying his BPL medallion. BA made BPL in the first half of October and took off for another vacation in K116-Land. LFA is back Stateside after duty in the Far East. EHH lost ten days on the air because of a broken ankle as the result of a hunting accident. FWD sends code practice Mon. through Fri. 1800 PST, 3695 kc., followed by Official Bulletins transmitted at 1845 PST. AIB spent the last half of October vacationing in the Southland. ZU skeds jr. operator (PRZ) on 14 Mc. each Sun. at 20XM. TGO reports school is cutting into his hamming. AMC is setting up a ham demonstration at the state capitol to help get plates. KT talked to six state senators and representatives re license plates. AHQ is building a new 'phone-c.w. rig. AVM is QRL work. SFN is hunting TV Indians. PHO has 94 countries and is handling Far East traffic. ULK's family is 100 per cent ham. ETO is hunting deer. ETX is running l-kw. s.s.s.b. — about 500 watts a.m. OCA reports Army Radio was assigned 3612 kc. by mistake. Happy New Year to all! Traffic: (Oct.) W7FRU 888, BA 825, PGY 740, FIX 69, OEB 64, VAZ 40, USO 34, AMC 23, APS 18, EHH 18, TGO 18, BG 16, AIB 14, WND 14, ZU 13, FWD 12, ETO 11, KT 10, PQT 10, JEY 9, EVW 5, ULK 5, AHQ 4, AVM 4. (Sept.) ## PACIFIC DIVISION

**NEVADA** — SCM, Ray T. Warner, W7JU — KOA, of Elko, received very favorable newspaper publicity when he talked down a disabled Douglas Skyraider to safety from the Elko CAA tower. UPS has erected a new 20-meter three-element beam. VIU received his "Worked 25 Nevada" certificate. Virginia, SNP, keeps busy on 75 and 40 meters, 'phone and c.w., since receiving her new ticket. AI, of K7FDB, reports activity in a 2-meter net picking up and increased mobile activity on 7268 kc. K7FDB, who makes BPL every month, handled 1048 during October. VZS, of Las Vegas, is heard on 10 meters when the band is open. VIU, UPS, KOA, and QYL were active during the recent S.E.T. SEC, PAM, and OO appointments are available to qualified members. Traffic: W7JU 8, VIU 8, UPS 2.

**SANTA CLARA VALLEY** — SCM, R. Paul Tibbs, W6WGO — KGBAM is holding daily sked with KL7BEX. K6EER is active on 40 meters. EEX is spending time on v.h.f. UTV is very QRL with color TV. YHS is finishing

(Continued on page 96)

**MODEL 20A**

MULTIPHASE EQUIPMENT is the overwhelming choice of SSB OPS everywhere. Ask any ham who uses it! Listen to it perform on SSB, AM, PM or CW!

### MODEL 20A

- 20 Watts Peak Envelope Output SSB, AM, PM and CW
  - Completely Bandswitched 160 thru 10 Meters
  - Magic Eye Carrier Null and Peak Modulation Indicator
- Choice of grey table model, grey or black wrinkle finish rack model.
- Wired and tested..... **\$249.50**  
Complete kit..... **\$199.50**

### SIDE BAND SLICER

#### MODEL A IMPROVES ANY RECEIVER

Upper or lower sideband reception of SSB, AM, PM and CW at the flip of a switch. Cuts QRM in half. Exalted carrier method eliminates distortion caused by selective fading. Easily connected into any receiver having 450-500 KC IF. Built-in power supply. Reduces or eliminates interference from 15 KC TV receiver sweep harmonics.

Wired and tested..... **\$74.50**  
Complete kit..... **\$49.50**

### Check These Features NOW IN BOTH MODELS

- **Perfected Voice-Controlled Break-in** on SSB, AM, PM.
- **Upper or Lower Sideband** at the flip of a switch.
- **New Carrier Level Control.** Insert any amount of carrier without disturbing carrier suppression adjustments.
- **New Calibrate Circuit.** Simply talk yourself exactly on frequency as you set your VFO. Calibrate signal level adjustable from zero to full output.
- **New AF Input Jack.** For oscillator or phone patch.
- **CW Break-in Operation.**
- **New Gold Contact Voice Control Relay.** Extra contacts for muting receiver, operating relays, etc.
- **Accessory Power Socket.** Furnishes blocking bias for linear amplifier and voltage for optional VFO (Modified BC458 makes an excellent multiband VFO.)
- **40 DB or More Suppression** of unwanted sideband.

## EVERYBODY WANTS MULTIPHASE EQUIPMENT

and for good reason. It's versatile, permits all-band operation 10 thru 160, it's extremely stable and it's a well engineered, dependable piece of communications equipment.

### MODEL 10B SUCCESSOR TO THE POPULAR MODEL 10A

- 10 Watts Peak Envelope Output SSB, AM, PM and CW
  - **Multiband Operation** using plug-in coils.
- Choice of grey table model, grey or black wrinkle finish rack model. With coils for one band.
- Wired and tested..... **\$179.50**  
Complete kit..... **\$129.50**

### QT-1 ANTI-TRIP UNIT

Perfected Voice Operated Break-in with loudspeaker. Prevents loud signals, heterodynes and static from tripping the voice break-in circuit. All electronic — no relays. Plugs into socket inside 20A or 10B Exciter.

Wired and tested, with tube.... **\$12.50**

### AP-1 ADAPTER

Plug-in IF stage — used with Slicer, allows receiver to be switched back to normal.

Wired and tested, with tube.... **\$8.50**

### NEW AP-2 ADAPTER

Combined AP-1 and xtal mixer. Allows Slicer to be used with receivers having 50, 85, 100, 915 KC and other IF systems. One xtal suffices for most receivers. **\$17.50**

### WRITE FOR LITERATURE

BR 3181

s.s.b. exciter using surplus crystals. It can be heard being used by TTB, BM has a new QTH in San Jose. Pappy puts in time off the air working at the plant of EL. NX reports working ZLs on 20-meter s.s.b. as early as six in the evening. W1B is using grounded-grid amplifier one 837 driving two in parallel driving up to about 500 watts input in s.s.b. This amplifier is the answer to you boys looking for medium power at little expense. C.w. operators are needed in the section to work on RN6, PAN, and TCC appointments. All those who can give one night a week to this work will find much pleasure helping with an important job. More information can be obtained by contacting IIC in San Jose. Well, gang, this is my first report as your SCM. With your help the section can be one of the most active in the ARRL field organization. You can help by sending reports of your activities as well as those of your friends. Keep others posted on activity in your club through this section in QST. Many of your club members keep in touch with home by reading this each month. Have your reports in the mail by the first of each month. Traffic: W6HC 145, UTV 50, K6BAM 16, EER 6.

**EAST BAY — SCM,** Guy Black, W6RLB — Asst. SCMs: Oliver Nelson, 6MXQ (v.h.f.); Harry Cameron, 6RVC (TVI); SEC: WGM RMs: HPW, JOH, PAM; LL, ECs: CAN, CX, FLT, QDE, TCU, ZZP, K6ERR. A reminder to all ARRL appointees — it's time for most of you to have your appointments renewed. Those who have not made any kind of report for the last year are especially urged to drop me a note. If I do not hear from them it will be assumed that they no longer are interested in their appointments. The Skyriders Radio Club has new officers: NCL, pres.; BSE, vice-pres.; Dot Crill (ZOE's XYL), secy.; MMK, treas. and net control. The East Bay teen-agers have KN6HEJ, pres.; KN6GBZ, vice-pres.; K6EHW, secy.; and KN6HRE, program chairman. HRE also is presi lent of the El Cerrito High School Radio Club. EHW says her QTH seems to be headquarters for the Magoons and the K6NCG gang. Second-hand reports have come this way to the effect that the Richmond gang feels that there is not enough news about them in the column. Shur-ks, gang, don't be so bashful. Let me know what's cooking and you'll see it in print. EJA is reported to be enjoying a receiver, and QDE is reported to be rebuilding. The Richmond Club now has a Viking for a club rig. The Hayward Radio Club's TVI committee includes PUH, LGF, SIF, and AXW. OHTG is the East Bay Radio Club's TVI chairman. FDJ is heading the Oakland TVI Committee. All of these groups report a very satisfactory TVI situation this last year with relatively few complaints. BNE has built a new speech limiter. FDG is working s.s.b. skulls with Japan. ITH reports work on 15- and 40-meter 'phone. YDI had a spell in the hospital. ACN had an operation which it is hoped will get him back in tip-top shape. WZR has a new job. GOP recalls the good old days on 160 meters with flea power. NDR has a new beam due from his XYL. LL reports traffic despite his busy duty as MTN traffic manager. Region 3 civil defense has started a series of drills on 6 meters. 47 Mc., 1761-ke. DCS band. K6ERR will get two different AREC nets going in the Berkeley-Albany-El Cerrito Area. Fifty-eight persons attended the East Bay Radio Club's dinner. The Mt. Diablo Radio Club's 3rd Fri. at 8 P.M. in the Coast Counties Gas. Co. Bldg., Walnut Creek. The teletype gang has set up a Sunday brea s-hedule 8 a.m. on the last Sun. of the month, percolator, Oakland. See FDJ for more details. Traffic: (O-A) K6FDG 1281, W6QPY 243, K6GK 156, WAF 108, W6LL 80, JOH 77, EFD 63, ASJ 35, ITH 34, YDI 9, EJA 8, CIB 6, K6EDN 4, W6OUU 1. (Sept.) W6LL 90.

**SAN FRANCISCO — SCM,** Walter Buckley, W6GGC — SEC: NL. Congratulations to the new officers of the San Francisco Radio Club: AIHH, pres.; PHS, vice-pres.; QMO, secy.; and Harry Witzke, treas. Harry always keeps the books in the black instead of red. Although it was thought best for the club to change officers every two terms we couldn't spare Harry. The HAMS have decided to go on 6 meters. Those interested and new members are expected to join the group. The San Francisco Naval Shipyard Club is busily making plans for the Christmas Dinner to be held at the Naval Shipyard. AJF, of Sonoma, is busy rebuilding the rig, is doing additional work on the 2-meter beam design, and has completed a new v.h.f. receiver. The 29ers lost FVK to Uncle Sam. Gordon was a very faithful net control on 10-meter transmitter hunts and always Johnny-on-the-spot for c.d. drills. SLX was stationed at Treasure Island during October. Friends saw him at the San Jose Hamboree but he must have had very little free time as he never showed up at any of the local amateur club meetings. Ed said he was taking notes from the Bay Area back to Eureka with him. The 14 Mobileers and their families took a trip up to Carson City, Nev., to handle communications for the Admission Day Parade. EJY acted as net control in his new Oldsmobile. CTH sat at the judges' stand, acted as relay station, and watched all the beautiful girls as they marched by. GGC had the portable Elmec rig set up. ISO helped set up the antenna and the XYLs made corrections, omissions, and additions on the parade sheets for the announcer. Oh, yes, they also called the two amateurs to attention when the boys were too busy to hear net control contact them. They

# Technical Bulletin for Amateurs and Experimenters

## A Note About Crystal Tolerance:

In the manufacture of crystals, certain limits must be adhered to when finishing the unit. Such limits are often held to better than .001% for commercial applications. Tolerances of this magnitude mean nothing unless the oscillator in which the crystal is to operate is an exact reproduction of the oscillator in which the crystal was calibrated. This same thing applies to wider tolerances. Persons doing work where close tolerances are required, (Broadcast, Commercial Two-Way, Civil Defense, CAP, etc.) should keep this in mind. The FA-5 and FA-9 Crystals are guaranteed to be calibrated to better than .01% of the specified frequency. The average FA-5 or FA-9 Crystal is held to better than .005%. This tolerance applies only when the crystal is operated into 32 mmf, for fundamental crystals and anti-resonant operation for overtone crystals. The information shown in Table I is of value in setting the crystal to frequency. (Crystals of closer tolerance, and for special circuits, are available from our commercial line.)

TABLE I

	OSCILLATOR LOAD CAPACITANCE			
	32 mmf	50 mmf	20 mmf	10 mmf
MEASURED	2000	1999.950	2000.060	2000.200
CRYSTAL	3000	2999.800	3000.200	3000.600
FREQUENCY	4000	3999.700	4000.400	4001.000
IN	7000	6999.200	7001.200	7003.300
KC	14000	13998.0	14003.1	14008.1

## ONE-DAY Processing

Spot Frequencies 2000 KC to 54 MC

## PRICES

FA-9\* (Pin Diameter .093)\*  
FA-5 (Pin Diameter .050)

Pin Spacing .486 (\*FA-9 fits same socket as FT-243)

RANGE	TOLERANCE	PRICE	
Fundamental Crystals		FA-9	FA-5
2000-9999 KC	.01%	\$2.80	\$2.70
10000-15000 KC	.01%	\$3.90	\$3.80
Overtone Crystals (for 3rd overtone operation)			
15 MC—29.99 MC	.01%	\$2.80	\$2.70
30 MC—54 MC	.01%	\$3.90	\$3.80

**.01% TOLERANCE**—Crystals are all of the plated, hermetically sealed type and calibrated to .01% or better of the specified frequency when operated into a 32 mmf load capacitance.

Orders for less than five crystals will be processed and shipped in one day. Orders received on Monday thru Thursday will be shipped the day following receipt of the order. Orders received on Friday will be shipped the following Monday.

## HOW TO ORDER

In order to give the fastest possible service, crystals are sold direct and are not handled by any jobber. Where cash accompanies the order, International will prepay the Airmail postage; otherwise, shipment will be made C.O.D. Specify your exact frequency and the crystal will be calibrated to .01% or better of this frequency with the unit operating into a 32 mmf load capacitance.

# EVERYONES BUYING DELUXE "PHASEMASTER-JR." EXCITERS

Only  
\$194.50

## NEW DELUXE "PHASEMASTER-JR" CHECK THESE EXCLUSIVE FEATURES

- ✓ SSB with Switchable Sidebands also AM-PM and CW operation
- ✓ 50W Average Voice Power Input
- ✓ Heterodyning Phasing Type Exciter
- ✓ All band 160M thru 10M supplied with heterodyning crystal and coils for 80M operation
- ✓ 40DB or more SB suppression
- ✓ New Carrier Level Control - inserts carrier for AM operation - zero beating VFO—or tuning, without disturbing carrier suppression
- ✓ Superb Anti-Trip Voice Control operation with ATVC plug-in unit
- ✓ RCVR muting and final amplifier blocking bias
- ✓ New Eye Indicator — for carrier balancing — tuning — AM modulation
- ✓ Simplified operating controls

**INDUSTRIES**

408 COMMERCIAL STREET MANITOWOC, WISCONSIN  
MANUFACTURERS OF PRECISION ELECTRONIC EQUIPMENT

were very busy watching the beautiful girls, also. The boys have taken over the 49ers Motel at Carson City each year and latest reports have it that the owners of said motel intend to spend the winter studying the code and hope to have W7 calls next year. 7ZT held his usual party for the gang the evening of the parade. Carson City certainly gives the amateurs a royal welcome each year. W6 calls heard in W7-Land were CTH, EJY, GCG, ISO, PAZ, UJ, UUQ, BMY, YPM, FNC, LFZ, OPU, and GGC. Sunday morning the boys had their usual club breakfast before setting off for home — all with a little lighter pocket-book. The 2-meter boys on c.d. have been invited to join the East Bay C.D. Net, 2 meters. ACN recently underwent an operation. Archie worked hard to get the license plates for the W6 boys. Calls were heard on MTN for blood donations and many responded. Congratulations to PHT on the BPL total. SWP didn't get his usual high score in as his wife was in the hospital. Reports are that she is well on the road to recovery now. Traffic: W6PHT 831, SWP 452, QMO 357 GGC 34, MWF 12.

**SACRAMENTO VALLEY** — SCM, Harold L. Lucero, W6JDN — Asst. SCMs: Ronald G. Martin, W6ZF; Edward V. Fuller, K6BMU; Gerald R. Hobbs, W6TMP. SEC: JEQ. Asst. SEC: EKP. OBSs: FNS, MWR, ILZ, SBN, AKF. OPSs: FNS, MWR, LJ. ORSs: ASX, SYY, FYK, LJ, OMR. ECs: ULC, AYU, EXP, JKA, NCV, SIY, SLV, CFZ, JDN. PAM: TYC. OESs: LSB, QAC. RM: OPY. OOs: BIL, FYK, FNS. These calls are for your future field and other ARRL contests. From now on the winter will bring us added contests as to our ability to cope with any emergency so, fellows, let's really be on the ball. We have lost one of our main traffic stations, REF. Betty has moved to Washington State. Luck to you at your new location, Betty. TYC reports that he is getting along very well with the PAM appointment. OPY is the man to get the c.w. nets on their way and I believe Harvey is doing everything possible. Keep up the good work, Harvey. SUP, K6GKR, and KN6HLO are father, mother, and son. SBH is more than filling his schedule as OBS. New officers of the Tehama County Amateur Radio Club are OEY, pres.; SBH, vice-pres.; TMP, secy.-treas. This is a very fine choice and the Club should go far. The new SJVN is now going and has several members in this section. I hear that this net is to change its name to the Central Valley Net. We are sorry to report that BHV had an auto accident and broke his back. 6ANR has moved to Nevada and now has the call 7ANR. Well, fellows, the appointments are coming along fine. Let's have more. Traffic: W6MWR 20, K6CFZ 15, W6JDN 10.

**SAN JOAQUIN VALLEY** — SCM, Edward L. Bewley, W6GIW — SEC: EBL. RM: K6BGM. PAMs: ZRJ, WJF. The SJVN is active again on 3635 kc. After getting poor results on CCN, our RM decided to try to get the old SJVN gang active again, and so far it looks hopeful. Any of you who are interested in handling some traffic, check in on 3635 kc. at 1900. A net has been started on 3900 kc. at 1100 Sun. by EBL in an attempt to bolster AREC activity and to help formulate ideas for the good of the section. It is hoped that all ECs and representatives from all the clubs in the section will check in regularly, and inform the rest of the section of the local activities. This also should help to coordinate activity between the various clubs. TXM is the new Kern County EC. FKY is in Detroit for a visit. A club is beginning to take shape in the Sonora Area. This will take in a large mountainous area, with hams widely scattered. These are adverse conditions for a club, but the gang is determined and we are sure it will be a success. A 2-meter transmitter hunt held by the Turlock Club was won by SQR, who was accompanied by GYN. The Stockton Club visited a TV station, watched a studio program, and then took a tour of the entire station. K6DUU and W6ZRJ presented very interesting and informative talks to the Turlock Club on incorporation and c.d. K6BGM is NCS on PAN Sat. nights. OHB is hunting in Wyoming. DVI attained an excellent rating in the last Frequency Measuring Test. Traffic: K6FAE 898, W6ZRJ 290, TTX 133, EBL 43, FEA 21, WJF 18, SJJ 15, ADB 10, K6BMM 3.

## ROANOKE DIVISION

**NORTH CAROLINA** — SCM, C. H. Brydges, W4WXZ — SEC: ZG. RM: VHH. PAM: ONM. OO: SOD. NCN is trying to get a new start on 3605 kc. There might be a few hams who remember the c.w. alphabet. YPZ has a new Telrex 20-meter beam. The Gastonia C.D. Net meets at 7 o'clock on 29,300 kc. A project by the members is to build portable transmitters and receivers with batteries for fixed or portable operation. The Charlotte C.D. Net meets on 3825 kc. at 9 A.M. Sun. Plans are now being looked over for a state-wide emergency organization in case of another "Hazel." FUS is making a roster of stations and their hours of operation during the hurricane. If your station has not been reported, mail information to FUS, Maiden, N. C. The call letter license plate bill is one we all have to work on. It is not a one-man or a group job. I have lots of information from the Virginia group which pushed it through in that State, and we have lots of work ahead of us. CZR is a new Official Bulletin Station. He transmits on 3860 kc.

### "POLY-PEDANCE"

## MODULATION

## TRANSFORMERS

These multi-tapped Stancor transformers will match all common impedances of Class "B" modulators to Class "C" load impedances of 2,000 to 20,000 ohms. With these versatile units in your rig you can change transmitting tubes or operating characteristics without having to invest in a new modulation transformer.

# Plan Now for the **4** biggest days in radio-electronics!

## **I R E** National Convention and **RADIO ENGINEERING SHOW**

**March 21-24 • New York City**

Once again, you'll soon have the opportunity of appraising all of the important new developments of the past year in radio and electronics. In 4 days, from March 21 through 24, the I R E National Convention and Radio Engineering Show will give you the complete picture of significant developments in the industry achieved during the past year.

**You'll hear** the presentation of scientific and engineering papers of vital interest to you, carefully arranged into related groups of technical sessions.

**You'll see** more than 700 exhibits in a 4-acre panorama of all that's new in the radio and electronics field, at Kingsbridge Armory and at Kingsbridge Palace.

**The Institute  
of Radio Engineers**

1 East 79th Street, New York City

at 2015 Mon. through Thurs. YPY has p.p. 813s and will be on with a "killer-watt" in the near future. A wide-spaced beam is used on 20 meters. I would like to take this opportunity to congratulate everyone who helped during Hurricane Hazel. All did a noteworthy job, especially the Wilmington boys, who were red hot. MVP and TLA are new ECs and VHH is the new RM. Happy New Year to all. Traffic: W4WXZ 20.

**SOUTH CAROLINA**—SCM, T. Hunter Wood, W4ANK—South Carolina amateurs did an outstanding job in providing emergency communications during Hurricane Hazel. Reports from ECs in Georgetown and Florence, W4FFH in Charleston, our PAM, and W9MQV/4, who operated from Myrtle Beach, have been consolidated in a report to the NEC. W9MQV/4 now is K4AQQ. ZIZ reports that his activity must be reduced because of the doctor's orders. LXX reports from Florence that FGX is working DX on 20-meter c.w., TSU has a new Harvey Wells transmitter, and LXX still is working toward WAS. ANK and TL in the last Frequency Measuring Test made average errors of 3.0 and 5.0 parts per million, respectively. WN4HOZ has worked 22 states with his 60 watts and reports that ERN, FM, HQC, and SBR have been a big help to him and he hopes to pass his General Class exam soon. WN4HGW has an HQ-129X and Heathkit transmitter. ANK and 3111/4 attended the Roanoke Division Convention and were the only South Carolina hams there. Traffic: W4ZIZ 88, FM 2.

**VIRGINIA**—SCM, John Carl Morgan, W4KX—VN and VSN meet on 3680 kc.; VFN on 3835 kc.; VON on 1820 kc., and ODN on 3845 kc. An outstanding job was done by the Virginia gang during Hurricane Hazel. The Blue Ridge ARC, Roanoke, keeps PCC fired up. The RARC is to be congratulated on its usual fine job of putting on a bang-up Division Convention. The Shenandoah Valley ARC's new club house now is under construction. New officers of the PVARC are 3GRF, pres.; KXV, veep and act. mgr.; AMZ, secy.; CC, treas. NRO, back at William and Mary, says the college club and PYN are back in business. Ex-PYNers 2KJE and 3UQU now are Mr. and Mrs. ZFV, back at V.P.I., reports a club is in formation there. The University of Virginia club station, SK1, was quite active during the summer. 3QQE really is keeping the Quantico Marine Hobby Shop station, PFC, rolling as evidenced by traffic totals. 3WDP does likewise at K4MC but complains of lack of outlets for southbound traffic, which indicates the need for more Virginia participation in 4RN. CHK, now Gen. Class, is NCS of the Southeastern Novice Net (3735 kc., Mon., Wed., and Fri. at 1700 EST). YHD, now back at M.I.T. and 1MX, says he worked 87 countries during the summer vacation from his home QTH in Loudoun County. LW is taking time out between issues of his *PB Virginia Bulletin* to build a new VFO and an all-band transmitter. JUJ has a new B. & W. 5100. CGE is trying new skywires to squeeze more out of 40 watts. JOS moved to North Carolina. KFC reports a mess of new plumbing atop a 50-foot pole. IF is complaining of skip snafu-ing VN. RJW says, "Back to the salt mines in mobile." YVG does music-making five nights, watch-repairing every night, yet keeps the rig mighty warm. Traffic: (Oct.) W4PFC 882, TFZ 138, K4MC 122, W4BLR 106, YKB 106, VYZ 72, YVG 70, KX 67, DWP 58, RJW 45, PCC 30, TYC 27, YZC 24, OLD 13, IF 9, LW 9, CKI 7, BYZ 5, BZE 4, ZYV 3, JUJ 2, ZFV 2, HJK 1, PYN 1. (Sept. corrected) W4PFC 740.

**WEST VIRGINIA**—SCM, Albert H. Hix, W8PQQ—USO has a new 20-meter beam. LXG has mobile rig on 40 meters. JUW is home from 5A3-Land and is at K4AF. HNC has a new rig with p.p. 810s at a kw. QHG has a new Ranger and is building new high-power final. KDQ has the new c.w. break-in system working well. GCZ got his 2nd-class telephone commercial ticket and is active on both nets. VCT should be back from Texas before too long. The following attended the Roanoke Division Convention in Richmond: GBF, JWX, PZT, BOK, NYH, CLX, and PQQ. NLT had a ham get-together at his home recently. PQQ was in Texas for a month. BK1 had DX as a guest recently. He is doing a lot of 2-meter work. ATF, now in Weston, will be on soon with new all-band rig. YPR, the SEC, has the AREC plan for this State worked up and it is urged that clubs get a copy of same in order to make final criticism and comments before it is printed and distributed. If any groups have suggestions and ideas as to what can be done to further organize for emergency operations, please contact YPR by letter as soon as possible. Tests are being conducted on 160-meter phone to determine what its possibilities are in being used for emergency communications. Traffic: WSAUJ 130, GEP 67, HZA 36, JWX 33, ETP 29, NYH 29, DFC 21, KDQ 3, HNC 7, LXG 5, PQQ 4.

### **ROCKY MOUNTAIN DIVISION**

**COLORADO**—SCM, Karl Brueggeman, W0CDX—SEC: MMT. RM: KQD. PAM: IUF. Congratulations to KQD on her appointment as RM and to IUF as new PAM. KQD also was elected to the Pacific Area Staff as member-at-large. The new officers of the Ski-Hi Radio Club are DRY, pres.; OIB, vice-pres.; OXS, treas.; W. H. Kadesch, secy. 7QHF and family have moved to Alamosa from Phoenix. (Continued on page 102)

*Also Worth waiting for!*

## THE *Harvey*-WELLS BANDMASTER RECEIVER R-9

### T-90 MATCHING TRANSMITTER

90 watts — The Midget with the mighty punch! Same size as R-9 Receiver to make a complete Station in only one cubic foot. Factory built and tested and complete with tubes.

Price **\$179.50\***

\*Prices subject to change without notice

This is a double-conversion, super-heterodyne receiver featuring a high signal to noise ratio and sensitivity. The low frequency second I.F. stages provide high selectivity. Minimum frequency drift for phone and CW operation is assured by stabilization of the variable H.F. Oscillator, Fixed H.F. Oscillator and the B.F.O. This is accomplished by the use of temperature compensating capacitors and voltage regulation of the d.c. supply to the oscillators.

The circuits employed on all five bands consist of one stage of radio frequency amplification, a first detector and high frequency oscillator, one stage of 1600 Kc. intermediate amplification with another detector, and a stabilized high frequency oscillator. This is followed by two stages of low frequency intermediate amplifiers (260 Kc.) followed by a detector of the diode type, a noise limiter, a high gain audio stage, and the audio output stage. Automatic volume control, beat frequency oscillator, voltage regulator, and rectifier circuits are included.

The audio output stage provides a full five watts of audio which is sometimes needed in mobile or marine installations having high ambient noise conditions. The unit is designed to operate from either 115 V 60 cycle power, 6, or 12 volts d.c. An illuminated "S" meter and rear lighted lucite dial assure ease of operation.

A socket mounted on the chassis provides a mounting place for a crystal filter or a crystal calibrator which will be available as accessories.

Rigid steel construction affords reliable performance under the most trying conditions, such as marine and mobile installations where vibration effects become very serious. This performance packed receiver is packaged in a very small case measuring only 12 3/4" x 10 1/2" x 6 3/4" overall.

R-9 receivers have self-contained 115 V 60 cycle a.c. power supplies. For mobile or marine installations, 6 or 12 volt d.c. vibrapacks are available. No modification to the equipment is necessary for operation with 6 or 12 volt d.c. supplies.

### PERFORMANCE DATA R-9 RECEIVER:

- Image Rejection: 30 to 60 db. from Band A to Band E.
- I.F. Rejection: 40 to 65 db. from Band A to Band E.
- S. N. Ratio: 10 db. on all bands measured with 2 microvolts signal input, 30% modulation, and five hundred milliwatts output into an 8 ohm load.
- I.F. Selectivity: 4 Kc. between 6 db. points.
- Audio Response: 200 - 7000 cycles at 3 db. points.
- Input Impedance: Nominal 50 ohms over all bands.

Price only **\$149.50\*** completely built and tested and with tubes

***Harvey*-WELLS ELECTRONICS, INC., SOUTHBRIDGE, MASS.**

# PENTA

**PL-6549**

## New Beam Pentode

This new transmitting type pentode offers good performance *even at low plate voltage* . . . and requires very little driving power.

For example . . . as a Class C amplifier it will deliver output of 60 watts at 600 volts . . . 74 watts at 750 volts . . . 110 watts at 1000 volts . . . driving power is less than  $\frac{3}{4}$  watt in each case. And for higher-power use, output of 250 watts at 2000 volts, with 0.8 watts drive!

PL-6549 is an aligned-grid pentode, conservatively rated at 75 watts plate dissipation. Its quick-heating, 6-volt thoriated tungsten filament . . . its rugged construction . . . make it ideal for mobile applications.

The suppressor grid of the PL-6549 gives it excellent current-division characteristics . . . thus screen power requirements are very low. It offers excellent power gain and output, either as an audio or radio-frequency amplifier.

**PENTA LABORATORIES, INC.**  
312 NORTH NOPAL STREET  
SANTA BARBARA, CALIF.

Ariz. The Hi-Noon Net handled 231 messages in 18 sessions. WVZ is bucking the Rio Grande RR extra board and is home a lot working DX on 20-meter c.w. LZY will be keeping the same OBS schedules. They are Mon., Tue., and Wed. at 1200 noon on 7094 kc. Elmer is working nights and can't keep any net schedules. IA has a new Class B final that puts out about 100 watts. Gene reports that there still is no activity on the Colorado Army MARS. The Colorado Slow-Speed Net will be active this winter, meeting on Mon., Wed., and Fri. at 1715 hours on 3570 kc. K0WBB and W0KQD will alternate as NCS. The Fort Collins group has applied for affiliation with the League. The Club's name is the Trout Route Mike and Key Club. Our Director, IC, has prepared all the necessary paper work for the introduction of the auto license bill to the State Legislature. It is now up to all of us to contact the officials of our districts and acquaint them with the bill before it is introduced. If we all do our part, fellows, we'll get this through; so don't shirk, just work. Traffic: W0KQD 473, CYT 49, AMR 39, IUF 36, HOP 13, IA 9.

UTAH — SCM, Floyd L. Hinshaw, W7UTM — The UARC program for October embraced a discussion of s.s.b. which was very ably directed by JPN, OOK, of the Club's TVI Committee, gave details of its activities. The Club is conducting a drive for new members and expects a large increase because of the prizes being offered by NMK. SAZ is mobile with war surplus and junked car receivers. Bert uses modified vibrator pack for filament supply. His signals are very FB even if the gear is not "commercial." RQT is sporting a new all-band whip antenna. RPY and QDJ won the second transmitter hunt held by the Ogden Club. Six mobiles participated in the hunt. KUX has a new 10B exciter and is running about 500 watts on s.s.b. now. Ery also is active on 2 meters. VEX, VHV, WMM, and RVX recently received General Class licenses and are now heard almost daily on 75 meters. The Novice Net still meets at 2 P.M. every Sun. on 3735 kc. Traffic: (Oct.) W7PIM 141, UTM 10, QWH 2. (Sept.) W7QWH 5.

## SOUTHEASTERN DIVISION

ALABAMA — SCM, Joe A. Shannon, W4MI — SEC: TKL, RM: KIX, PAM: RNX. New appointments: TKL as SEC; DZF, WOG, and WOH as ECs; WOG as OBS. Welcome to the following newcomers at the section: KNAS AIW, ALL, and AIP in Huntsville; AJG in Tuscaloosa; AJJ in Childersburg; and KN4FMI and W4BHF in Tuskegee. S.s.b. is hopping in Birmingham with EBD, KNW, RKS, and YEG each striving to get on first. DFE, now has Old Timers Club certificate. WJX, ARR, and YYJ took in the YLRL picnic in Virginia and visited with KYL, SIB, CXL, and ZOI in Kannapolis, N. C. The Birmingham Club held a hot dog supper for members with about fifty turning out. The Montgomery Club is holding raffles of parts to raise money for a new club house. FMV does the honors as auctioneer. Transmitter hunts again are being held the 2nd Sun. of each month at 1400 on 3825 kc. HEK, in Northport, now has his General Class license and is making plans for a new rig to work 75 meters. OR reports that activity is increasing in Cullman and lists the following newcomers at St. Bernard College: BFT, GUR, and WNAs EFTO and HFZ. Welcome, fellows. Traffic: (Oct.) K4FDY 730, W4KIX 140, WJG 96, TXO 39, YRO 29, TKL 26, DXB 24, PWS 22, EJZ 17, OAO 14, OR 11, VIY 8. (Sept.) W4UHA 69, PWS 28, WHW 7.

EASTERN FLORIDA — John W. Hollister, Jr., W4FWZ — Birthday greetings to the Flamingo Net. In the October S.E.T. held near Palatka five ECs and 19 stations participated in a joint drill. The Miami S.E.T. brought out 45 stations. Thanks to ECs UHY, DVR, OBB, UHC, WEM, and IYT. A new net is the Transcontinental C.W. Net, on 3790 kc., starting at 4 A.M., with BMY as NCS. Use it to QSP the left-overs or to originate; it has very wide coverage. There will be plenty of net traffic for all at the State Fair at Tampa which starts Feb. 5th. The Novice Hurricane Net Bulletin (by YJE) is full of news about the gang. Get a copy. The NHN is going places. Ft. Lauderdale: FNR reports twenty 144-Mc. stations are expected as the result of renewed interest. AB, club station, uses Viking and NC-240D. PM says JZV, EUV, and ZUJ are using 20-meter VP beams. EC PPR turned out a good drill for the S.E.T. Jacksonville: The DCEN mobile gang meets Thurs. at 1931 on 29.0 Mc. and now includes 7 stations. The JARS sets up traffic-taking booths wherever they can. Key West: DRT finally got WAS. ELS reports a ham club on board at the NAS with 20 very active members. Merritt Island: FIQ reports new club officers are FIQ, FXH, and GED. Ken uses a Viking II, Miami: Here's a new wrinkle: The club auctioned off kits! IEH moved to Ft. Lauderdale. BSX, an Asst. EC, moved to Oklahoma. DRD got a Coast Guard citation for doing a good job with the Auxiliary Net. PBS has a 500-watt emergency generator for use with DEN work. The DEN has 36 active members on 29,044 kc. Clippers and compressors are being built like mad, says PBS of the gang. Ocala: That traffic booth at Silver Springs made BPL for DVR again. Orlando: We grieve with DQA in the loss of his jr. operator. BMY has p.p. 813s for a kw. on c.w. St. Augustine: WN4FJE

Then read what Hams say who own the

## MOSLEY 'Vest Pocket' Beam

60 countries in 4 months, says Leo, W4ERK, Miami

"...used a Vest Pocket Beam on 20 about four months. Cannot praise it too highly. We worked all 48 states in 7 weeks. To date, over 60 foreign countries. ...compliments daily on our signal."

40 Meter QRM no Bogey for Mel, W8GQY, Denver.

"...the 40 Meter (Vest Pocket) Beam has proven very satisfactory. We have not lost a single contact from being covered up with QRM. ...I think this beam is really worthwhile."

Expanded Ham horizon for Bill, W0RFC, Waverly, Ia.

"I am very well satisfied with my Mosley V-P Beam. I hear countries I have not heard with any other antenna in my 20 years as a Ham."

"Such good reports hard to believe", says Frank, VE6AC, Calgary, Alberta, Canada.

"...I have found it hard to believe my ears. My power input ranges from 22 to 50 watts ...yet my reports are, almost without exception, much better than those I am able to give. My Mosley V-P Beam (is) a joy beyond words."

"Outstanding results" for Whitey, W4PQ, Miami.

"...the performance and results obtained have been outstanding. W.A.C. and W.A.S. accomplished in a matter of days after the Vest Pocket Beam was installed, with many fine DX contacts."

Zed-L's say S-9 on 40 meter sig now, reports Nick, W0MUU, Salina, Kansas.

"Just a few lines to tell you how pleased I am with the (Mosley) 40 Meter Vest Pocket Beam. It is the best antenna, possible, for a city lot. It solved all my problems. I have been getting S-9 reports from New Zealand consistently. I have had several reports of 35 Db front-to-back. (I) do hope others will be able to enjoy the same advantages I have found."

Write for specifications and data sheets:

**MOSLEY ELECTRONICS, Inc.**  
8622 St. Charles Rock Rd., St. Louis 14, Missouri

Called stations answer Mac, W9CVQ, Wilmette, Ill.

"...I have found the Vest Pocket Beam highly satisfactory. Its power gain appears to be virtually equal to that of full sized beam antennas. I think I can summarize its performance by saying that when I call stations on the V-P Beam, they come back! Assembly of the beam was a straightforward, simple task in view of the clear instructions and color coding. I assure you I am well pleased with the MOSLEY Vest Pocket Beam Antenna."

and remember, when choosing Your beam—

MOSLEY 'V-P' Beams are made as small as possible, consistent with True Beam Performance. Element lengths are correctly proportioned to the loading coils to practically eliminate end-fire. Boom lengths and element spacings are such as to provide outstanding forward gain and front-to-back ratio with negligible SWR over a convenient bandwidth.

MOSLEY 'V-P' Beams are built up to high standards ...not down to a low price for false economy. Quality materials and good design assure Long Service Life and True Beam Performance. MOSLEY Beams for 20 and 40 are available NOW! A V-P Beam for 10 and 15 will be announced soon!

Order from your favorite Ham supplier!

WHO'S... WHO on the band  
WHAT... spots are free  
WHERE are replies to your CQ's

YOUR ANSWER:

# NEW PANADAPTOR MODEL PR-1

the eyes of your receiver

For amateur operation featuring  
Panoramic reception on a  
3-inch CR Tube

Why operate "blind"? The new PANADAPTOR MODEL PR-1 provides visual monitoring over a band of frequencies up to 200 kc lets you "see" everything from the other fellow's frequencies in three-way or round robin QSO's to replies to your CQ's. You see it all on a 3-inch CR Tube which also simplifies frequency setting and station monitoring, facilitates network operations, assists in making adjustments of transmitters and antennae, enables identification and interpretation of transmitter signal characteristics (your own and others), selects QRM-free spots for sending and listening.

Once you've used the PR-1 on your rig—once you've gotten the "feel" of the over-all band picture, send continuously—you'll never again want to feel your way without these eyes!

## FEATURES!

- Visual displays up to 200 kc. wide • 3-inch Cathode Ray Tube • Phone output for use of PR-1 as a second unisignal aural receiver • Cathode Ray Tube connections for use as external scope.

14 South Second Ave.,  
Mount Vernon, N. Y.

says he lost his good antenna that really snagged the QSOs. At Ketterlinus are AGK, AGU, WN4FJE, and KN4AHA, a good group for EC UHC, St. Petersburg: With a sad heart we report the death of EYL, Tampa: New club officers are YIL, LAW, YFI, and ALP. Traffic: W4DVR 579, PJU 514, LAF 139, WEO 114, BMY 100, IYT 61, DRD 71, WS 47, TRN 34, RWM 255, FWZ 24, ZIR 21, DSC 18, FSS 12, FIQ 5, YV 4, WEM 3, YNM 1.

**WESTERN FLORIDA**—SCM, Edward J. Collins, W4MS/RE—SEC: PLE, ECs: HIZ and MIF, QK has a pair of 813s going on 75 meters. CCY is perfecting his mobile gear. JPD has put up 40-meter antenna for the winter season. TTM had transformer trouble with the HT-9. 9CPI/4 is enjoying 20-meter c.w. on the B. & W. HJA is looking at the s.s.b. unit for his B. & W. DAO/DEF is QRL with the club station. K4ALI, UYS, YRF, BGG, BBU, HBK, KN4AGM, and W4AYS are planning big things for the Pensy High School Radio Club station, K4AEF. GMS keeps weekly ssked with Pensy from Tallahassee. UUF keeps the 144-Mc DX stations jumping. KN4AEP is having transmitter trouble. MUX reports from Rome, Italy, while on vacation. OWN reports many early morning QSOs on 40 meters. EAR meets the gang on 10 meters. ZFL has FB vertical and gets out FB on 20-meter c.w. The gang wishes Mrs. UCY a speedy recovery. MS is working on linear amplifier for 10B exciter. WKQ worked 303 in 54 sections during the CD Party. CPE has a new converter in the car. ROM is back on 10 meters. RKH has the monitor for 10 meters going full time.

**GEORGIA**—SCM, George W. Parker, W4NS—SEC: OPE, PAMs: ACH, LXE, RM: MTS, OCG, Nets: Georgia Cracker Emergency Net meets on 3995 kc. Sun. 0803, Tue. and Thurs. 1830 EST; Georgia State Net (c.w.) 3590 Mon., Wed., Fri. at 1900. New appointments: IKK as OES, CFJ and FZO as OPS. The Atlanta Radio Club has a new meeting place in the Red Cross Building on Peachtree St. Meetings are held the first Thurs. of each month at 7:30 p.m. All Atlanta hams and visitors are invited to attend. KN4ANZ now is on in Moultrie. FGH, of Quitman, and CFJ, of Atlanta, are building on TV stations. BXV has a new 348-R. OCG reports that the c.w. net is picking up; he still needs more Georgia outlets and more Georgia traffic. IKK, in Rome, EUK in Marietta, KGD in Dahlonega, and CFJ in Atlanta, are getting rigs on 420 Mc. IKK wants to hear from anyone who would like to try for Rome on 220 or 420 Mc. WN4HYV, the XYL of OGG, is on the Novice bands in Augusta. YRX, active on 75 meters in Warner Robins, is looking for traffic. K4WBP operated from the Southeastern Fair this year. FZO got 32 states on 40-meter 'phone in October. LXE has a new mobile rig. IPL is rewiring his mobile for a new 12-volt car, and is moving his home rig into a new pine-paneled shack. The Macon Club meets every other Mon. at the City Hall. All Macon amateurs and visitors are welcome. WKP is getting a new mobile from Santa this year. Thanks to the club secretaries and others for all the news this month. Happy New Year. Traffic: K4WAR 1171, W4OCG 285, YRX 166, IMQ 140, K4WBP 127, W4BWD 107, WN4HYV 76, W4ZW/T 63, MTS 44, NS 22, MA 11, FZO 3, BXV 2.

**WEST INDIES**—SCM, William Werner, KP4DJ—SEC: HZ, ZW received ORS appointment. DV renewed ORS, OBS, and OO appointments. WD and MS have Tel Rex beams on 20 meters. RK built a short beam for 20 meters. WR has a 300-watt Eldico on 15 meters. The PRARC meets at the N. G. Officers Club the first Tue. of each month. ZV is ex-W4KZT, W6PXC, DL4XD. WF sends greetings from the U. of Miami; WXC sends greetings from the U. of Maryland. KD worked HI6TC for No. 209. ES, CI, BI, and EE loaned the Ponce c.d. their Gonset Communicators when c.d. equipment failed during the floods. The first 2-meter contact from Red Cross station ID was with AAN and CX, using Gonset Communicators. AC and PK are using 430 Mc. ID will call the roll of the P. R. Emergency Net at 7 p.m. AST because of skip at 8 p.m. on 3925 kc. The Antilles Net, YX NCS, meets at 7 a.m. and 6 p.m. on 3865 kc. OOs DV, KD, and RL qualified in the September F.M.T. 2-meter activity in the San Juan Area now includes VX, CX, HZ, DV, EA, JM, and AAN, all using Gonset Communicators. HN uses a Millen 75-watt job; the frequency is 145.26 Mc. MV built a copy of the Tel Rex beam for 20 meters. K2BLN and W3IOU visited KP4-Land. YX has new 75A-3 receiver. W4DKW now is ABC. W7SVJ/KP4 and W8DRT/KP4 are on 75 meters. KH6ABS/KP4 is on 20-meter c.w. AAO is a Navy 'copter pilot. ML is back from stateside military training. ZN was sent a 100-signature scroll from Rosario, Argentina, thanking him for sending a vitally-needed drug that saved a lady's life. QA sent reports to a Colombian amateur station on their team's progress in the international bicycle race here. PRARC's Work KP4 Contest will be held in January. Traffic: KP4ZW 5, GP 3, RK 3, ZD 1.

**CANAL ZONE**—SCM, Roger M. Howe, KZ5RM—WA replaced RM as SEC. DG is the new PAM, and DE and GF continue as RMs. GF finally got that hundredth card. W5FJA spent a week here as the guest of WA and had a fine time. He even had the privilege of seeing those "mad beam erectors," the washer crew, in action at GF's QTH. DG and KA are "witches" No. one and six, respectively, and handle quite a bit of traffic for the Maritime Mobilers

on 15 meters. Ex-KZ5BL, now K4AEE, is on the air at Miami Springs, Fla. Your former SCM, NM, has been very ill but is improving daily. For a while FL, DG, and XYLLM were keeping daily skeds with W5TAF to report on his condition to his family. DL6NU was in town and attended the monthly meeting of the CZARA, which was held at the home of club proxy, RV. The CZARA station, KZ5JW, is on the air with a Viking I and NC-125. Traffic: KZ5WA 57, KA 5, RM 2.

### SOUTHWESTERN DIVISION

**LOS ANGELES** — SCM, Howard C. Bellman, W6YVJ — Latest happenings include the appointment of Hank Garman, 6BHC, as Assistant SCM, with Bill Schuch, 6CMN, taking over Hank's job as RM of SCN. The last Traffic Breakfast of the year was held at Clifton's again and BHG was the chairman. The next meeting will be held in January. The following qualified as Class I Observers in the September F.M.T. in order of accuracy: AXV, LIY, RW, NKT, MUR, MSG, CK, ENR, and K6FA. Although not qualifying, K6HB also took the test. Included in the *Oscillator*, the magazine of the Associated Amateurs of Long Beach, are two pages of "Cures for TVI Caused by Fundamental Blocking." SCW, scoutmaster, informed me that his Explorer Post 177, sponsored by the Whitney High Handicapped School, has a radio unit with a 300-watt, 20-meter layout. The financial backing comes from the Studio City Rotary Club. One of the Explorers is KN6IC1, of Canoga Park. Ages run between 14 and 18. Bob, the scoutmaster, used to be 7MIQH. NCP was visited by K17ANT, ex-W6ZEV. LVQ reports that the Whittier 50 Club had seven mobiles patrolling the city on Halloween at the request of the police. The boys also participated 27 hours in the S.E.T. in Whittier. LDR is running 1 kw, now and says he is sporting a new 20-meter beam. ORS tells of a rig blowing up at UID/6 while mobile on 2 meters. LYG is bragging about his Viking Ranger. He now needs outlets in Santa Ana and Newport Beach on 2 meters. K6BEQ is trying to form a 40-meter net. For details see K6DDI and/or K6EZM. Walt went bike-mobile with a buzzer and worked a mobile. LPE, of K6FCZ, wants to start a 20-meter net on 14,260 kc. Dave Wersen, K6CV, announces that the Frank Wiggins Radio Club, YAS, is a member of the Council of Radio Clubs in Los Angeles. K6DIM and CV are delegates to the Council while KPQ is alternate. New officers at the Club include K6DIM, pres.; KN6EBJ, vice-pres.; IPS, secy.; K6IDW, treas.; K6IDX, sgt. at arms; KPQ, station mgr.; and K6CV, sponsor. The members will accept traffic from 1600 to 2200 Mon. through Fri. on 14.1 Mc. Traffic: (Oct.) W6LYG 648, K6FCZ 542, W6CMN 384, K6FCY 278, W6FMG 180, GYH 94, NCP 94, USY 64, BHG 46, CK 24, K6BWD 22, DQA 17, W6ORS 16, K6BEQ 13, W6DWP 13, F1 13, NTN 11, K6COP 6, KN6HOV 6, W6LVQ 6, AM 2, PZN 2. (Sept.) K6FCZ 1063, DQA 89, W6GYH 86, GJP 27, PZN 6. (Aug.) K6DQA 84, W6GYH 50, PZN 10. (July) W6GYH 30.

**ARIZONA** — SCM, Albert H. Steinbrecher, W7LVR — Asst. SCMs: Kenneth P. Cole, 7QZH; Dr. John A. Stewart, 7SX. SEC: VRB, PAM; KOY, Arizona 'Phone Net: Tue. and Thurs., 7 p.m., 3865 kc. Arizona C.W. Net: Tue. and Thurs., 8 p.m., 3690 kc. In accordance with the recent policy of our new SEC, VRB, of having the ECs in various sections around the State sponsor alerts, October saw the AREC in action in a statewide "Operation Car Count," sponsored by Tucson, with LAD, local EC, in charge. The purpose of the alert was to spot mobiles on the main highways leading to and from Arizona communities; to count all incoming and outgoing vehicles; to report same to a local fixed control station, which in turn would relay this information to headquarters at Phoenix. The alert was a huge success, thanks to the following ten fixed and mobile stations located in ten communities around the State: BFA, CDQ, DRQ, HUV, IRX, KUJ, LAD, LHF, LND, LVR, MQE, MVV, MWD, NYT, OEE, PJY, PSH, QHD, QHT, RBA, REO, ROZ, SQX, STQ, TJT, TNY, TOA, UCA, UCX, UNL, UXK, VRB, VVJ, 6SBK, K6BAW, and KB6AN. RUX received MARS appointment. ULP and VAG got General Class licenses. TVJ is new EC for Douglas Section. 5BDB/7 is moving back to Dallas. VOZ is back from Alaska. VRB won a Worked All Tucson (WAT) certificate. Traffic: W7LVR 15, RUX 8.

**SAN DIEGO** — SCM, Don Stansifer, W6LRU — Asst. SCMs: Tom Wells, 6EWU; Shelley Trotter, 6BAM; Dick Huddleston, 6DLN. SEC: VFT. ECs: BAO, BZC, DEY, DLN, HFQ, HRI, IBS, KSI, KUF, and WYA. RM: ELQ. K6DBG, OBS, in Santa Ana, now is putting out bulletins on 145.3 Mc. Mon., Wed., and Fri. nights. The Rohr Club is giving instruction on Tue. and Thurs. for beginners in both code and theory. K6DBG is building a Ranger Kit. GBG tells the gang to try 21 Mc. more often with good openings from sunrise on noted. The Orange County gang went all out in the recent S.E.T. with 33 stations participating. The AREC in San Diego County held a very successful S.E.T. on 75, 10, and 2 meters with the majority of its members participating. The organization was much better than last year, and the speed of traffic-handling because of frequency allotments was noted. GBM passed his exams for Naval Air Cadet. K6HKX is a new amateur in Santa Ana.

(Continued on page 108)

MGT is chasing DX, and is up to 50 countries. Nine San Diego DX men attended a DX meeting at the home of LRU in November. We are glad to note more activity in this field locally, which should have more representation DX-wise considering the number of active amateurs. For information on meetings, contact LRU or BZE. KN6DVF has a new HQ-140. K6BEC has an LM frequency meter now. K6CUZ has a new VFO and 33-foot vertical, and swears he might work out of the State now. The Convair Club is very successful with its classes, and many are taking their Novice and General Class exams as a result of the knowledge gained attending this worthwhile activity. Happy New Year and good hunting in 1955. Traffic: W6IAB 3028, IZG 538, YDK 439, KYB 207, ELQ 169, K6DBG 38.

**SANTA BARBARA**—SCM, Vincent J. Haggerty, W6IOX—The traffic report from K6NBI by radiogram was delivered by JPP. K6CRJ reports of 2-meter signals from Santa Maria being heard in Santa Barbara, which constitutes an extensive "over the hills" jump. IID is building an amplifier to go with his 20A s.s.b. exciter. FYW is active on CARS and runs skeds with JFP on 145.8 Mc. Art Monsees, HJP, reported from Offutt Air Force Base in Nebraska to say he will be locating his antenna system in the Santa Barbara Area one of these days. Members of the section are reminded that it is time to be considering a replacement for the present SCM, who wishes to retire at the end of his term. Traffic: K6NBI 121, CRJ 7, W6FYW 2.

## WEST GULF DIVISION

**NORTHERN TEXAS**—SCM, T. Bruce Craig, W5JQD—SEC: RRM, PAMs: IWQ, PAK, RMs: PCN, QHL. The Dallas Amateur Radio Club had an interesting program on Transistors with a movie on "The Atom Goes to Sea" as part of the Nov. 22nd meeting. A new Novice in Dallas is WN5HHK. Our Vice-President, NW, has every QST since the beginning except Jan. 1943. K5FBE reports the BC-610 is back on the air with 3-band vertical. JLT reports the visit of a Navy buddy, 01GP, recently, the first time since 1945. SYL reports as one of the operators at the Dallas Fair where 200 operators made over 2000 contacts and handled 308 messages. PTK has completed the 300-watt rig, complete with VFO power supply, speech amplifier, etc., all in 8 3/4 panel. He uses a 4-125A final with a pair of 811A modulators. KVA is completing the kw. rig with 4-400, 100TH modulator, and power supply all in a 17 1/2-inch panel space. DYU reports as one of 55 amateurs in the Fort Worth c.d. test on Oct. 31st. Sixteen mobile units were employed and 25 "handy-talkie" units. CVA headed the Fort Worth amateurs. YIJ, at Marlin, is handling traffic for vets in the hospital there. The October SEC report shows a gain to 311 reporting stations. The Terry County Amateur Radio Club has been issued the call HPI. The club (NFO, pres.) has 30 members and meets the 1st and 3rd Tue. of each month. SNX, OES, reports a v.h.f. meeting was held in Brownfield on Oct. 23rd with 50 present. Fellows, please have your club secretary send in a postal card with activities to your SCM. The v.h.f. boys are making progress and we are still hoping to get a complete link of 2-meter operation across the entire northern half of Texas. Traffic: W5TFB 638, K5FBE 548, W5YPI 207, AIC 172, KFB 162, PAK 121, UBW 63, UFP 54, ACK 47, ZWR 33, CF 30, SYL 24, TPT 21, RRM 18, DYU 9.

**OKLAHOMA**—SCM, Dr. Will G. Crandall, W5RST—Asst. SCM: Ewing Canady, 5GIQ. SEC: KY, PAMs: PML, SVR, ROZ, RM: GVS. While on a Goodwill Tour of the South American countries for the Federal Department of State, Governor Murray of Oklahoma kept in regular touch with his office in Oklahoma City by means of amateur radio via GZK. The North Fork Amateur Radio Club of Western Oklahoma obtained excellent state-wide publicity on its Simulated Emergency Test on Oct. 17th with very favorable editorial comment in the *Greer County News of Mangum*. Publicity of this sort should be the aim and object of every amateur and amateur group as it amply justifies the retention of amateur frequencies for public service. KY, as SEC, has definitely enlivened the State for AREC by appointment of many new county ECs and is holding a weekly EC round table following OPEN on Sun. morning. The Will Rogers High School Amateur Radio Club has been organized with 15 members and has the club call ETJ. Officers are DCC, pres.; CEG, vice-pres.; DCA, secy.; WN5DBZ, treas.; and ZWT, trustee. Newly-elected officers of the Enid ARC are GIQ, pres.; PCQ, vice-pres.; KWF, secy.-treas.; REC, asst. secy.; WN5HBL, custodian. A new code class also has been started. Many thanks to those sending in news and traffic reports. Traffic: W5MRK 192, PML 35, SVR 32, SWJ 25, FEC 23, AIQI 20, QAC 20, KY 17, TNW 16, RST 15, ADC 14, WSM 12, EHC 10, TC 9, REC 8, VAX 8, MFX 7, PAA 5, PNG 5, BYC 2, WTA 2.

**SOUTHERN TEXAS**—SCM, Dr. Charles Fergagh, W5FJP—ZIH, MRV, and RP11 detected a faint c.w. signal on 75 meters from RES mobile in the hills of New Mexico. His car was broken down "60 miles from nowhere." They made a long distance call to Hobbs, N. Mex., and had repair parts taken to him. New officers of the Temple ARC: VLF, pres.; VRN, vice-pres.; WDW, secy. The TARC is sponsoring a local mobile emergency net. Drills

# HANDSOME PRACTICAL USEFUL

You'll agree that's an accurate description once you start using *QST* Binders. If in the past you've had trouble locating a particular issue of *QST* in that pileup of books and papers around your shack, now is the time to do something about it. Start the New Year right by obtaining a Binder in which to protect and preserve the big, new 1955 issues coming up.

Finished in reddish-brown fabrikoid with stiff covers, each Binder holds twelve issues of *QST*, opens to any page and lies flat. Your copies are protected and always available for easy reference.

**QST BINDERS (POSTPAID)**  
Each — \$2.50

## EASY TO LEARN CODE

It is easy and pleasant to learn or increase speed the modern way — with an **Instructograph Code Teacher**. Excellent for the beginner or advanced student. A quick, practical and dependable method. Available tapes from beginner's alphabet to typical messages on all subjects. Speed range 5 to 40 WPM. Always ready, no QRM, beats having someone send to you.

### ENDORSED BY THOUSANDS!

The **Instructograph Code Teacher** literally takes the place of an operator-instructor and enables anyone to learn and master code without further assistance. Thousands of successful operators have "acquired the code" with the **Instructograph System**. Write today for full particulars and convenient rental plans.

## INSTRUCTOGRAPH COMPANY

4709 SHERIDAN ROAD, CHICAGO 40, ILLINOIS

are held Tue. at 5:30 P.M. on 3855 kc. PNP is NCS. UPO and VLF are now mobile. VRN found the hidden transmitter at the Oct. 24th family picnic. AET, Hidalgo County EC, reports a considerable amount of activity on the border. The Rio Grande Valley staged the 1st Red Cross simulated disaster just a few weeks before the recent flood. FZO, control station for STEN Zone 4, and member of TSG and MARS, has a kw. power unit for emergency work. The RGARC in Edinburg is doing an FB job and many new amateurs will be heard in the near future. The boys in Harlingen have organized a new club and had a transmitter hunt in cooperation with the Harlingen AFB amateurs. SZB found the transmitter and AET was second. The Rio Grande Valley has organized a motorcycle corps of Boy Scouts, industrial mobiles, USNR, National Guard, State Guard, Border Patrol, amateurs, etc. SZB reports from the RGARC. AET changed his mobile loop to a center-loaded whip. YDI has a new mobile. SU is putting up a new 15-meter beam. BRD is on 40-meter c.w. working DX. TVL is back with a new rig. WN5BWT took the Tech. Class exam. CRA has a new B. & W. transmitter. AUO has a new mobile converter on all bands. VIT has a new TCS. NVQ has a new 813 rig on the air. MBU has a new low-drain emergency rig. FZO has a vertical on 75 meters and a 40-meter vertical beam. PAR is operating on *Padre I*, with a kite antenna. PBU is building a new shack. BYI has a 40-meter beam which is a pair of 40-meter dipoles fed 135° out of phase. GLA has an 11T-9 on the air. Mary Ann reports the GCARC club house is coming along FB. YDO is spraying it. OGG is giving code lessons. AUN is looking for a pair of 813s. VUS is putting up a vertical for his 813. Gateley is now WN5HWS. Devaney has been racking up a lot of DX with a new ground plane. BPF also is doing FB with DX. DJD is decorating the club walls with QSL cards. OGG is custodian and trustee of the club transmitter. URU has been elected to the board of directors of the HARC. FJF, recently in Washington, passes along 73 from Mr. and Mrs. George Ashenden, formerly of the F.C.C. office in Houston. JQ made all-40-meter c.w. WAS. IUU is operating mobile. The HARC is conducting a drive to raise funds for a new club house. Traffic: W5MN 1089.

**NEW MEXICO** — SCM, G. Merton Sayre, W5ZU — SEC: KCW, PAM: BIW, V.I.I.F. PAM: FPB, RM: JZT. The NMEPN meets on 3838 kc. Tue, and Thurs. at 1800. Sun. at 0730; NM Breakfast Club every morning except Sun. 0700-0900 on 3838 kc.; the NM C.W. Net daily on 3633 kc. at 1900. GEM has taken NCS for NMEPN until BIW gets the big rig back on. On Oct. 9th WBJ, THA, UDM, GEM, EDN, OME, BIW/DRA, and 1RII/5 helped out with "Seaborn Collins Day" at Las Cruces. The Tularosa Valley ARC's new officers are JMM, pres.; DVA, vice-pres.; FVV, secy-treas.; ORP, program ch.; DGR, station mgr.; Lou Oliver, pub. mgr. The Caravan Club is very active in the Albuquerque Area. SUC won the award for the most outstanding Junior Amateur in the West Gulf Division at the Kerrville Convention. RFF won the V.H.F. Award for New Mexico in West Gulf competition. AYU in Texas, and SCX in Oklahoma. VWU has worked 7VMP in Phoenix on 2-meter c.w., and has been copying meteor scatter from 4HHK. He now has 32-element 2-meter beam operating. FAG also copies VMP. HZC, IIZG, HZH, and HZP are new Novices in Albuquerque. In the Sept. 16-17 F.M.T. the following average errors in parts per million were made: QHK 5.7; BIH 13.0; GRI 40.3. This qualifies them as Class I Observers. Ruidoso in 1956! Traffic: W5ZU 115, WPA 40, AQO 35, HJF 33, BXP 13, ZSL 10, GEM 7, WBC 6, CEE 5, QR 5, UTS 5, ZGG 5.

## CANADIAN DIVISION

## Heat transferring electrical connectors for Eimac tube types

Eimac HR connectors are especially designed to give proper electrical connections with the plate and/or grid terminals of Eimac tube types while providing efficient transfer of heat to the air from the tube element and glass seal. Machined from solid dural rod, these heat radiating connectors are available in ten types to accommodate Eimac internal anode type tubes—rectifiers, triodes, tetrodes or pentodes.

For further information on Eimac HR connectors, contact our Application Engineering department.

latest members of the Brass Pounders League. DFE gave his antenna system its annual pre-winter overhaul. AEH and BMV have completed mobile installations. DRE has an antenna rotor. AXZ, at Carnat, operates a Mark Nineteen set on batteries. DLN is trying hard for Class A. AIG, who visited VE2FL and OB recently, hopes to be working mobile soon. There was an uplift in 10-meter activity in October. The Hamilton Emergency Radio Corps gave fine demonstrations at home and school association of the Prince Philip School. BSW covered 3300 miles on his vacation trip to the Deep South. NN gets good reports on 10-meter f.m. mobile. The Quinte Club held a successful auction. VZ, manager of OSN, which operates nightly on 3535 kc, solicits your traffic. AJR contacted WSRP/VE3, who was mobiling in the Windsor Area and piloted him and his family right to her festive board. Up Kapuskasing way AVS has formed a northern net in an effort to provide coverage to northern Ontario and Quebec and to provide traffic-handling experience for amateurs situated in the Bush Country. The Net operates twice weekly at 1915 EST Mon. on 3680-kc. c.w., and Wed. on 3755-kc. 'phone. Newly-elected officials of the West Side Radio Club of Toronto are AYO, pres.; IZ, vice-pres.; AIB, secy. At the helm of the Mohawk Radio Assn. we find CC, pres.; DQU, vice-pres.; BLT, secy. This club has a fine 2-meter mobile program well under way. The Hamilton Amateur Radio Club officers are CJM, pres.; IQ, vice-pres.; DFE, secy. BNQ is editor of the club's monthly bulletin. Traffic: VE3NG 260, NO 220, BUR 129, BJV 126, AJR 113, VZ 94, TM 87, ATR 82, GI 82, AUU 73, DQX 61, AOE 45, CP 37, DFE 14, AVS 5.

**QUEBEC**—SCM, Gordon A. Lynn, VE2GL—WW has five-element beams on both 20 and 15 meters, also a six-element beam on 10 meters, and placed guys on the supporting mast after Hurricane Hazel! JR has 120 watts on 20-meter 'phone with a two-element beam. PZ has 500 watts 'phone on 20 meters. APH is using three-element beam on 20-meter c.w. AAO took part in the Frequency Measuring Tests with gratifying results. EC reports with regret the death of XV. VE1YW now is VE2ANK. AM and VA are newcomers in Victoriaville. AUH is on 3.7 Mc. from Forestville. ACS, LE, and AME are now operating VE2CL, the club station at Laval University. KG has completed walkie-talkie and gave it a workout during the C.D. Test and is converting the home rig from 814 to 833A. PL reports formation of the Northland Net on 3755 kc, at 1915 hours Wed. with 13 reporting stations, all members of AREC. ZZ visited several of the boys in Trois Rivières. AON has flea power on 75 meters. ADK has had the call changed to IQ. UQ, formerly VE3DPG, has Command transmitters on 80, 75, and 40 meters with 1155 receiver. H again is active with battery-operated equipment from his summer place at Wallis Lake, with 175 watts c.w. on 80 and 40 meters and Elmac AF-67 on 'phone with S-76 and NC-240D receivers from Sherbrooke. AGG now has the big rig operating from Drummondville on both c.w. and 'phone. CP has been appointed alternate PQN net control and EAN liaison TRN Wed. DR reports conditions poor with net work difficult. Traffic: (Oct.) VE2DR 104, GL 32, EC 25, ATQ 10, FL 9. (Sept.) VE2EC 21.

**ALBERTA**—SCM, Sydney T. Jones, VE6MJ—XG has been appointed Route Manager and is in the process of organizing a new net to be known as the Pipe Line Net on a frequency of 3620 kc. This net meets daily except Sun, at 1930 hours, and will have outlets to OSN, WSN, RN7/VE7, and the Polar Net. Harry is interested in hearing from all who may wish to take part in this net activity. AL is a new ORS. OS is a new OBS. HMI has returned from a visit to Halifax. A new radio club has been formed at Coaldale with AM, pres.; CK, vice-pres.; and TS, secy.-treas. WC reports he will have to rebuild to get away from TVI. The Northern Alberta Radio Club has code classes under way on 3687 kc, on Mon., Wed., and Fri. at 1930. Comments regarding reception would be appreciated. Calls of the code practice stations are 6CE, 6WR, 6YP, and 6ZR. Your SCM will welcome applications for any of the ARRL appointments. Emergency Coordinators are needed in all the larger centers in Alberta. Traffic: VE6HM 47, OD 22, WC 8, YE 8, MJ 7.

**BRITISH COLUMBIA**—SCM, Peter McIntyre, VE7JT—Congratulations to ASR, who was nominated by the W group of RN7 to take over the management of the RN7 traffic net. As he has accepted, your cooperation with Whitey would be appreciated by him. Also congrats to AV upon winning the BCARA Trophy Cup. Denny Readville has been untiring in his efforts in amateur affairs and has been president of the BCARA for three terms. Both he and his capable executive have just been reelected for another term. Others who had been nominated for the BCARA Trophy were FY, QC, JB, US, and XW, all of whom have contributed to the betterment of amateur radio in one form or another. The thanks of the British Columbia amateurs is extended to them for the work they have done in their individual fields for amateur radio. A new revised edition of the *Amateur Radio Telephone Directory* is being revised and brought up to date as soon as possible and the listings will be as of the latest DOT address listing, so if any errors in QTHs are made you didn't get your change of address in soon enough for the "Book."

# new branch!

Radio Shack Corporation  
announces a new branch at  
230-234 Crown Street  
New Haven 10, Connecticut

NEW HAVEN'S RADIO SHACK duplicates in every way the operations of the 32-year-old parent company at Boston. In its own three story building on busy Crown Street in downtown New Haven between Temple and College Streets, the new Radio Shack carries the complete line of 30,000 items shown in our 224-page 1955 catalog. Branch Manager W1WIS — sometimes referred to as Mr. Single Sideband — and staff are alert to the needs of novice and veteran Hams alike; not to overlook the music lovers, servicemen, experimenters and "do-it-yourself" gentry who naturally gravitate to Radio Shack because more things are in stock at the right time . . . and because our prices are capital-L-low. In other words, Radio Shack of Connecticut is a full-fledged husky, not a 90 lb. weakling. We hope you'll use our facilities and our SPruce 7-6871 phone number often!

**At New Haven:**

\*Coming: VFO for 2 Meters, Highly Stable, Reasonably Priced

AQS and his XYL have left for the Barbadoes. The Island seems to be having a surge of mobilitis, with more reports of fellows going mobile. The interior gang wants to start a 2-meter net. Anybody want to start the ball rolling? Traffic: VE7TF 118, QC 70, DH 39, KL 27, ZV 19.

**MANITOBA** — SCM, Leonard E. Cuff, VE4LC — NW has been doing some experimenting recently and finds that using a lamp bulb as a dummy load is just the thing to work up to 50 miles on 75 meters. GY, the Air Force Club station, has been heard again on the 75-meter band putting out a big signal. AY, at Haskett, is being heard again after a long lay-off with a very good signal. YR has moved to a new home in the same locality. AP is reported to have been visiting AI at Binscarth. AN is a new one on 75-meter 'phone. KG went hunting in the Dauphin Area but did not report what he was hunting or what success he had. HL paid one of his periodic visits to Winnipeg and informs us that he has new antennas on 80, 40, and 20 meters. AI is a frequent visitor to Winnipeg these days. The Manitoba C.W. Net is in full swing on 3700 kc. daily at 1900 CST. Anyone interested in the c.w. net, please contact HL, the RM. The NCSS for this Net are AZ, KL, and KN. Those of you who wish to keep up to date with the ARRL Official Bulletins should tune in to JM, who is an OBS and may be heard at the following times on 3760 kc.: Mon., Wed., and Fri. at 1830 CST, and Sun., Tues. and Thurs. at 1230 noon. Traffic: VE4AI 33, GE 19, EF 17, HL 14, KG 7, RB 5, GB 4, QD 4, NW 3, JW 2, MK 2, MO 2, WS 2.

**SASKATCHEWAN** — SCM, Harold R. Horn, VE5HR — CW reports from Regina that local AREC members had a good workout in the Oct. 9-10 Simulated Emergency Test. JK, JW, GH, RH, HA, DM, DP, ZZ, and CW, as control station, made 112 points. Besides the home stations 1 mobile and 2 walkie-talkies were used. New officers of the Regina Club are CW, pres.; TS, vice-pres.; HA, secy. The Club visited the local TV station and gained considerable knowledge but no equipment. OC is on a new shift and should find it better for chasing the rare ones. EO is now on 'phone and is a new member of the 'phone net. HJ has moved to Lloydminster; GK also is a new ham there. JZ is new at Pelican Narrows. 5RE did better than the VEOs, getting 100 per cent check-in on their 'phone net. TH is in VE3-Land for a few months. RC took unto himself an XYL. FY says amateur frequencies are poor at Uranium City. YF is heard occasionally between home and school meetings. DN advises that activities at Prince Albert are at a low ebb. JO and DA work 21 Mc. with good results. The XYL of MV presented him with a young YL. Traffic: (Oct.) VE5HR 28, DS 22, CW 17, DR 14, FG 13, RE 12, BF 10, GC 10, BZ 8, JN 8, GX 6, LU 6, GO 2, KG 2, QL 2. (Sept.) VE5DS 29.

## The Exciting **JOHNSON VIKING** **NEW 1-KW POWER AMPLIFIER**

The ultimate in Deluxe Transmitters at a sensational price—CW, AM and SSB transmission at the maximum allowable amateur power. Amplifier, modulator, power supply and controls self contained in a single, gray metal desk pedestal base. Accessory top and three drawer pedestal unit is available at extra cost, to form executive type metal desk.

Never Before Have You Seen Such a Transmitter With These Features:

- Single switch selects maximum legal input SSB, AM phone or CW, with 250w input position for tuning and/or low power operation.
- All controls easily reached from seated operating position.
- Requires only 30w RF and 15w audio for AM, or 10w peak for SSB.
- Continuous tuning 3.5 to 30Mc. with no coil changing.
- Rugged wide range pi-network plate tuning and loading assembly, can be tuned at full power without danger of damage. Matches nominal 50 to 500 ohms impedance with additional capability of tuning out large amount of load reactance.
- Bridge neutralized 4-250A final amplifier tubes are completely stable.
- High level class 'B' modulators, using push-pull 810's, has plate saturation limiting.
- 2500v. plate supply delivers over 700ma.
- Push-Pull blowers in modulator-power section for continuous air exchange.
- Requires 210-240v., 50-60 cy., 1-phase.
- Thoroughly TVI-suppressed.
- Entire compact chassis unit slides out of cabinet on rollers for instant and complete accessibility.
- Engineered throughout for safe operation. Complete overload protection with electrical reset switch and fuses located on power control panel.

**COMPLETE YOUR GALLON RIG with any of the following transmitters as an exciter-driver unit.**

### JOHNSON VIKING 'RANGER' Transmitter-Exciter Kit

A rugged, compact, and completely self contained transmitter-exciter designed for easy assembly by either novice or experienced amateur. These are the features:

- TVI Suppressed • Built-in VFO—7" dial • Instant bandswitching—10 to 160 meters • 75 watts CW—65 watts phone • Pi network output
- Panel mounted crystal sockets • 6146 final and 1614 modulators
- Dimensions: 15 x 12 x 9"

Complete Kit, less tubes **\$179.50**  
Factory Wired and Tested **258.00**

### Deluxe Transmitter Kit JOHNSON VIKING II 100 WATTS ON PHONE 130 WATTS ON CW

Every desirable feature has been included in this outstanding transmitter: BAND-SWITCHING to all amateur bands, from 160 through 10 meters...TVI suppression...100% AM modulation...PARALLEL OUTPUT 6146 tubes...PUSH-PULL 807 MODULATORS. Supplied complete with pre-punched chassis, copper-plated steel cabinet, tubes, hardware, assembly instructions, and all necessary parts and components. **\$279.50**

Viking II complete with tubes, wired and air tested. **337.00**

### B & W TRANSMITTER Model 5100

Complete self-contained amateur transmitter with maximum operating ease and efficiency. Only three tune-up controls: VFO set, final amplifier, and Pi network loading. Single bandswitch selects correct output frequency and Pi network inductance for desired band. Blue-gray steel contour cabinet with recessed touch-latch cover.

- Features: • 135 watts phone, 150 watts CW • Self-contained VFO • Covers 80-40-20-15-11-10-meter bands • Rapid bandswitching • Built-in low-pass filter • TVI suppressed • Pi network output.

Complete with tubes. **\$442.50**

**SINGLE SIDEBAND ADAPTER** in compact matching cabinet now available for Model 5100 approx. **250.00**

### New CENTRAL ELECTRONICS Model 20 A Multiphase Bandswitching SSB Exciter

Has new performance features, plus the proven characteristics of the popular Model 10A. 20 watts peak output — SSB, AM, PM, CW. **\$249.50**

In Kit Form. **199.50**

**MULTIPHASE EXCITER 10B**—10 watts peak output—SSB, AM, PM, CW. **179.50**  
In Kit Form. **129.50**

**SIDEBAND SLICER**—An SSB adapter that will improve any receiver. **74.50**

### COLLINS 32V-3 AMATEUR TRANSMITTER

A receiver-sized high-performance rig built to Collins standards in every detail. Rated at 150 watts input CW, 120 watts phone, gang-tuned with bandswitching to cover 80, 40, 20, 15, 11, and 10 meter bands. Excellent audio gives extraordinary good readability. Stable VFO, completely enclosed R-F section and thorough filtering and shielding provide maximum protection against TVI. Complete with **\$775** tubes.

Established 1927

For 1955!

The DOW-KEY CO. now offers a silent open type AC power relay.

The only AC power relay with a written guarantee covering silent operation. These midjet relays, with a rating of 25 amps, set a new standard. Versatile design provides 5 possible mounting positions. Available in all voltages both AC and DC.

The popular DOW coaxial line has the new look for '55!

The service we promised to consumer and dealer is now available with enlargement and tooling program recently completed.

Complete information is in our new catalog and free by request — send for your copy today.

Only DOW guarantees silent AC relays. "It's the principle of the thing."

*Territories in both Canada and USA open for established factory reps.*

## Auroral Propagation

(Continued from page 16)

visible portion of such formations, but one might expect that a good returned signal could be obtained from the ends of the arc which appear near the horizon. The rotary Yagi showed, however, no signals coming from those directions. This is another case of no signal coming from the brightest part of the visible aurora. This is in agreement with Figs. 7 and 8, showing that signals are rarely observed in the east or the west, but only in the northern quadrant.

V.h.f. auroral radar echoes have been studied at several other places in the northern hemisphere, where the above-described large ranges and restrictions of the echoes to the north have also been found. At most locations, however, the visible aurora has occurred predominantly at large distances from the observing site, and so the radar results were to be expected. For example, at Ithaca, New York, most visible aurora is at low angles in the north. Overhead visible aurora is seen only for a total of a few hours over the whole year, and southern aurora is even more difficult to study. For high latitudes, with generous quantities of aurora, the experimental observations require some unusual process to be involved which will limit the echoes to the ranges and azimuths that are found.

### An Explanation

Supported by these observations, Booker, Gartlein, and Nichols<sup>11</sup> at Cornell have enlarged upon a theory by Moore<sup>12</sup> which considers the auroral ionization to be composed of numerous streaks of ionization running parallel to, or concurrent with, visible auroral rays. Aurora is believed to be caused by charged particles shot from the sun which are able to enter the earth's atmosphere only if they follow the lines of the earth's magnetic field. Indeed, auroral rays are sloped slightly with respect to your horizon, because they are following the lines of the earth's magnetism. A corona (overhead star-shaped formation) is a bundle of such rays viewed up from the bottom, the center appearing slightly to the south. Now meteor trail ionization has been previously studied and has been found to give v.h.f. radio reflections best when looking perpendicular to the trail.<sup>13</sup> The perpendicular requirement becomes more severe as one uses higher frequencies. The strength of the reflected signal fluctuates during formation and during wind distortions of the meteor trail, because the contributions to the total signal from the different parts of the trail interfere with each other.<sup>14</sup> The Booker, Gartlein, and Nichols theory im-

## BUY OF A LIFETIME! TRIED AND PROVEN THE WORLD OVER

### LETTINE MODEL 240 TRANSMITTER WITH MOBILE CONNECTIONS AND A.C. POWER SUPPLY

This outstanding transmitter has been acclaimed a great performer throughout the world. Excellent for fixed station, portable or mobile operation. Air wound plug-in coils used for greater efficiency — never obsolete — will take any new freq. Ideal for General Class Amateur, Novice, CAP, CD, MARS, Broadcast, Marine and Airport Communications. An outstanding buy, direct from our factory, ready to operate.

The 240 is a 40 to 50 watt Phone-CW rig for any freq. from 1.6 to 30 mc., complete with: (8 x 14 x 8) cabinet, A.C. power supply, 40 meter coils and crystal and tubes: 6V6 osc., 807 final, 5U4G rect., 6SJ7 crystal mike amp., 6N7 phase inverter, 2 6L6's PP mod. for excellent audio quality. Weight 30 pounds. TVI instructions included. 90 day guarantee. Price \$79.95.

\$25 deposit with order — balance C.O.D.  
80, 20, 10 meter coils \$2.91 per Band, 160 meter coils \$3.60.

Telephone: Freehold 8-1880

agines the auroral ionization to be composed of hundreds of such "meteor" trails. This would explain the observed fast-fading or growl of the aurorally-propagated signal. It would also require that the radio-ray paths be nearly perpendicular to the trails, or in this case, the earth's magnetic field. (See Fig. 10.)

Calculations have been made by Chapman<sup>15</sup> for locating the feet of perpendicular lines from the receiver and transmitter to the lines of the earth's magnetic field. These calculations relate the height above the earth, the range of expected echoes, the angle of elevation of the radio path, and the latitude of the echo point for a given magnetic latitude of the observing site. Theoretically, auroral echoes should be limited to northerly directions in the northern hemisphere and should occur only at large distances having low angles of elevation. This, as shown in earlier paragraphs, is verified by experiment.

Since auroral reflections can come only from low angles of elevation with respect to the horizon, the amateur should design his antenna to favor these directions. The antenna should be very sharp in the vertical plane and pointed at the horizon. Thus, vertical stacking is highly recommended. Low-angle radiation requires that the antenna be high above the surrounding terrain and emphasizes the importance of a good QTH and a tall tower. The perpendicularity theory would suggest a greater spread in azimuth than in the elevation angle, and indeed, simultaneous echoes have been obtained from separated directions in the north. It would, therefore, be wise to leave the horizontal pattern as broad as 30 degrees or so, meaning that the antenna should not be wider than about 4 dipoles. Frequently, during violent aurora, there is difficulty in finding the direction that gives maximum signal. It is tempting to think that such behavior is due to signals arriving from high angles of elevation, where the auroral light appears brightest, but this explanation is probably false. The perpendicularity theory may explain why aurora seen visually does not give a signal because of its position. (In addition, it is felt by some that active ray forms will give stronger signal than quiet arc forms.) In general, sufficient low-angle radiation is a more important aid in getting strong auroral signals than was previously expected.

### Acknowledgements

A large vote of thanks is due the many amateurs that have sent in auroral reports via Tilton and QST. Here is a further example of amateur radio supplying research information difficult to obtain in any other way. Assistance has been rendered by Ken Bowles, W2MTU, and Ed Tilton, W1HDQ. Financial aid has been provided by the U. S. Army Signal Corps at Cornell and the Geophysical Institute at the University of Alaska.

## ELECTRICAL ENGINEERS or PHYSICS GRADUATES

*with experience in*

### RADAR or ELECTRONICS

*or those desiring to enter these areas...*

*The time was never more opportune than now for becoming associated with the field of advanced electronics. Because of military emphasis this is the most rapidly growing and promising sphere of endeavor for the young electrical engineer or physicist.*

Since 1948 Hughes Research and Development Laboratories have been engaged in an expanding program for design, development and manufacture of highly complex radar fire control systems for fighter and interceptor aircraft. This requires Hughes technical advisors in the field to serve companies and military agencies employing the equipment.

As one of these field engineers you will become familiar with the entire systems in-

involved, including the most advanced electronic computers. With this advantage you will be ideally situated to broaden your experience and learning more quickly for future application to advanced electronics activity in either the military or the commercial field.

Positions are available in the continental United States for married and single men under 35 years of age. Overseas assignments are open to single men only.

Hughes Field Engineer H. Heaton Barker (right) discusses operation of fire control system with Royal Canadian Air Force technicians. Avro Canada CF-100 shown at right.

Relocation of applicant must not cause disruption of an urgent military project.

## Mobile Converter

(Continued from page 20)

The r.f. amplifier may now be lined up, band by band, by tuning in a signal from a generator or the antenna, and then adjusting the amplifier grid and plate coils for maximum response. The grid-coil slug should be adjusted with signals near the high-frequency end of the band, and with  $C_3$  set near minimum capacitance. The antenna coupling should then be adjusted to the point where a slight peak in signal or background noise is heard within the range of  $C_3$ .

At 3.5 and 7 Mc., it is important that the receiver used with the converter be well shielded if broadcast-band interference is to be avoided. Most car receivers are well shielded, but some of the less-expensive communications receivers may not be. However, the converter will be most useful to a communications receiver at the higher frequencies where feed-through will usually be negligible. When interference from local broadcasting stations is experienced, the slug of  $L_1$  should be adjusted to minimize the strongest b.c. signal toward the low-frequency end of the b.c. band, while the slug of  $L_2$  should be likewise adjusted for the strongest signal toward the high-frequency end of the band. These two adjustments will usually serve to attenuate most other b.c. signals between the two extremes of frequency. However, other combinations may be advisable, depending on the frequencies of the local stations. In most cases, it should be possible to wash out b.c. interference, by adjustment of these two traps to the point where it is no longer bothersome.

In some parts of the country, the second harmonic of the 2900-ke. crystal will beat with WWV's 5-Mc. signal, so that it will be heard when the b.c. receiver is tuned to 800 kc. (or signal frequency of 3700 kc.). This can be used as a check point for the frequency alignment of the b.c. receiver.

With the crystal frequency known, ham-band frequencies can be determined quite accurately (if the b.c. calibration is correct) by simply adding the h.f.-oscillator frequency, given in the table, to the reading of the b.c. dial.

Measurements with a signal generator showed that recognizable audio output could be obtained with a signal input as low as 0.1  $\mu$ v. Most of the background noise disappeared with the input signal raised to 0.3  $\mu$ v., and solid reception was possible with an input signal of about 0.5  $\mu$ v.

The cost of a complete set of components for this converter will run about \$65.00. The crystal and set of three coils required for each band runs about \$7.65, so that the cost will be reduced by this amount for each band that is not needed.

## Cubical Quad

(Continued from page 23)

loop are at equal distances from the center. A permanent joint can then be made between antenna wire and pole by wrapping several turns of bare copper wire tightly around the pole where the antenna touches it, threading the ends of this bare wire through small holes drilled in the bamboo pole, and then soldering together as shown in Fig. 3. Use a good grade antenna wire so it will not stretch later.

The main boom consists of a 12-foot piece of 2 X 2 pine with another 6-foot piece used as a center brace to prevent the ends of the boom from dropping. This boom is mounted at its center by bolting it to a piece of angle iron welded to the top of the rotator shaft. A lower boom composed of a 12-foot piece of 1 X 2 pine is mounted by means of a small bracket 8 feet 4½ inches down the rotator shaft parallel to and in the same plane as the main boom. The completed radiator and reflector are fastened to the ends of the main boom by means of the mounting brackets, and the center insulators for the radiator and reflector are fastened to the ends of the lower boom which also serves to support the feed line and the reflector stub. This lower boom is probably unnecessary but it does make the beam neater and stronger.

The radiator and reflector are made exactly the same. Small insulators are placed in the center of the bottom side of both reflector and radiator and the stub is fastened to the one and the feed line to the other. Seventy-two ohm coax will give a very close match, but 52-ohm coax has been used here with very good results, even though there is some mismatch. The stub for the reflector is 6 feet long and spaced 3 inches. A very simple sliding short can be made by putting a Fahnestock clip on each wire of the stub and then soldering a wire between these clips. This "short" can be easily slid along the stub from the top of the antenna tower or pole by means of a small stick. Remember to use bare copper wire for the stub or the sliding short will not work. After the beam is in place atop the tower, the reflector may be tuned by sliding the shorting bar up and down the stub until a minimum S-meter reading is obtained from a local ham located off the back of the beam. That is all there is to it; you are now tuned on the nose and ready for business.

Antenna articles always seem to contain a paragraph or two telling about the results achieved with the antenna under consideration, usually in very glowing terms. This article is no exception. This beam has consistently given good results, DX reports averaging about 1 "S" point higher than on the old three-element job, and if the band is open at all it is unusual to call CQ DX and not receive at least one reply. The power usually runs 125 watts here. This beam is not a cure-all for your DX and QRM problems, but it will certainly give the three-element boys a good run for their money. Put one up — you'll like it.

# Terminal Radio

## BRAND NEW 1955 HAM GEAR

...For a Full Measure of Pleasure Thruout the New Year!

### NEW! Johnson Viking ADVENTURER CW Transmitter Kit

Work round the world with the ADVENTURER . . . the perfect transmitter kit for both novice and experienced amateur. Completely self-contained.

Loaded with new features:

- Power Input — 50 Watts • Effectively TVI suppressed
- Pi-network output tuning — no antenna tuner needed
- Single-Knob Bandswitching on 80, 40, 20, 15, 11 and 10 meters
- Extremely compact in size — only 7 3/4" high x 10 3/4" wide x 8 1/4" deep.

No. 240-181-1 VIKING ADVENTURER Kit with tubes, less crystals and key. Complete with easy assembly directions and operating instructions.

**\$54.95**

TERMINAL Regularly Stocks these Famous JOHNSON Ham Favorites:—

### NEW! GONSET *Monitone* MODEL 3022

#### 3 Way Code Oscillator

No need to tie up dollars in an instrument which can be used only for code practice purposes. The NEW MONITONE is a multi-purpose instrument — can be used three ways: Code Oscillator, Phone Monitor and CW Monitor. Has no shock hazard on the keying system. Can be used with any CW Transmitter to monitor code sending as well as transmitter keying characteristics. At the flip of a switch it can be used as a monitor for speech quality in conjunction with a radiotelephone transmitter. Size 6 3/4" wide x 5 1/4" high x 4" deep — 115 volt AC

**\$19.50**

NEW! Model 3057 GONSET 2 Meter DE LUXE COMMUNICATOR in 12 VDC/117VAC **\$229.50**

NEW! Model 3049 GONSET 6 Meter DE LUXE COMMUNICATOR in 6 VDC/117VAC **\$229.50**

Also Model 3058 in 12 VDC/117VAC **\$229.50**

NEW! GONSET 500W SSB, AM or CW Linear RF Power Amplifier **\$395.00**

TERMINAL distributes all of GONSET'S Communications Equipment for Amateur, Commercial and Private Aircraft.

NEW!

### Hallicrafter S-38D Receiver

The new and completely revised model of the old S-38C — 5 tubes AC-DC with built-in speaker — 540 Kc to 32 Mc with 4 Band selector plus band spread tuning

**\$49.95**

The newest and most complete line of HALLICRAFTER always available at TERMINAL: S-38-D • S-85 • S-86 • S-94 • S-95 • SX-62-A • SX-88 and SX-96. Write W2BUS for further information on availability and prices.

NEW!

### Hallicrafter SX-99 Receiver

This brand new Communications Receiver from the HALLICRAFTER Laboratories provides a new concept in Receiver performance in its price class.

**\$149.50**

### ELMAC AF-67 TRANS-CITER

The ELMAC AF-67 is a compact 60 watt input, fully AM modulated, 7 band, built-in VFO or crystal controlled transmitter. Since power supply is external, it is equally adaptable for use in car or home, or both. Too

many features to list, ask W2BUS for any additional dope you want. AF-67 Wired, tested with all tubes

All ELMAC Products Regularly Stocked.

**\$177.00**

PMR-6A — 6 Volt Receiver .....	\$134.50
PSR-6 — 6V Power Supply .....	24.50
PMR-12A — 12V Receiver .....	134.50

TULSA, OKLA.

## Receiver Performance

(Continued from page 27)

extremely large signal-handling capabilities required. Several tubes recently announced show some promise, but until they are proven the receiver designers laughingly suggest a 4-125A or similar for the receiver r.f. stage.

To prove cross-modulation when operating "on the air," the received signal can be reduced with a 20-db. resistive attenuator. This will reduce an S9 signal to about S6, which is still readable, but at the same time drop a 1-volt signal, due to that kilowatt next door, to 0.1 volt. If the splatter disappears when the attenuator is placed in the antenna lead, then the difficulty is in the receiver. Remember not all modulation splatter is in the receiver. A few inconsiderate amateurs are guilty of severe overmodulation. A more simple test is to remove the normal antenna and connect any short piece of wire that will reduce the desired signal to a just readable level, and then note the presence or absence of splatter. Either test is acceptable for tracing the source of this type of interference.

If you are not looking for weak signals, either of the above methods for reducing input signal level can help receiver cross-modulation. A separate r.f. gain control (variable cathode resistor) is also sometimes helpful in reducing the cross-modulation that occurs in the mixers.

This receiver discussion has been handled in general terms. A later article will give some hints as to how the 75A-3 can be adapted best to serve the amateur with special interests like DX work on one hand or just local rag-chewing on the other.

I would like to express my appreciation to the many Collins engineers who assisted in this discussion of receiver performance.

## Appendix

So-called thermal noise is generated in any resistance whether it is the antenna resistance, the parallel tuned impedance of the r.f. stage grid circuit, or an actual resistor. Noise power is proportional to absolute temperature, bandwidth, and resistance. Noise power is given by

$$N = \frac{E_n^2}{R} = \frac{4KT \Delta f R_{eq}}{R}$$

where

$K$  = Boltzman's constant =  $1.38 \times 10^{-23}$ ;

$T$  = Absolute temperature, 300° at room temperature;

$\Delta f$  = Bandwidth in cycles;

$R_{eq}$  = Noise resistance of the receiver plus the dummy antenna; and

$R$  = Sum of the receiver input resistance plus the dummy antenna resistance.

Signal power is given by  $S = \frac{(mE_c)^2}{R}$

where  $m$  is the percentage of modulation divided by 100 — sometimes called modulation factor;

$E_c$  is carrier voltage of receiver signal; and  $R$  is as above.

A perfect receiver is one which has no noise due to coupling circuit, r.f. stage shot noise, mixer noise, or any other noise contribution except that of thermal noise given by the above expression.

Noise figure =  $N.F. = \frac{S/N \text{ theoretically perfect receiver}}{S/N \text{ actual receiver}}$

(Continued on page 126)

*Gratitude is  
a debt I  
intend to repay.  
Uncledave*

← Then

Now →

For the past 35 years radio amateurs throughout the world have been purchasing equipment and supplies from me. Their friendship and loyalty have been the determining factors in our success. For this we are grateful and it is time that we made an effort to express our appreciation in a material way.

Many amateur radio clubs need financial aid. Many others can use extra funds if these funds can be obtained without assessing their members. We have a plan which will greatly assist all amateur radio clubs.

For every order received until March 1, 1955, we will send our check for 15% of your order — to your radio club for deposit in their treasury. When you place your order, be sure to include the name and address of your club and treasurer.

My best wishes for a healthy, happy and prosperous New Year.

## with the amazing, new AMECO LOW PASS FILTER

The AMECO low pass filter suppresses the radiation of all spurious signals above 40 Mc. from the transmitter. The filter uses a Constant K Circuit, and is designed for Coaxial cable (52 to 72 ohms).

**OTHER FEATURES INCLUDE:**

- Negligible Insertion Loss
- 35 Db and more attenuation of harmonic and spurious frequencies above 50 Mc.
- Will handle up to 200 watts of RF power
- Each unit complete with bracket, and instructions

At the amazingly  
**LOW, LOW price of \$1.95** Amateur  
net

## HIGH PASS FILTER

The AMECO high pass filter is placed in series with the TV receiver's antenna to prevent the transmitter's signal from entering the receiver. All frequencies above 45 Mc. are passed through without loss. The AMECO high pass filter is designed for use with the common 300 ohm twin line.

Model HP-45

### OTHER FEATURES INCLUDE:

- 40 db and more attenuation at 14 Mc. and below; 20 db attenuation at 10 meters.
  - Negligible insertion loss
  - Filter uses balanced constant K circuit
- At the amazing  
low, low price of

5BRF—Workmate to FTR. **\$67.95**

**C3 Radio Supply Company**

2502 Jefferson  
Tacoma 2, Wash.

Phone  
BR 3181

As the actual receiver approaches theoretical performance, the above expression approaches 1.0, or 0 db. If the receiver noise is zero except for thermal noise across  $R_{eq}$ , and the antenna matches the receiver input resistance, then  $R_{eq} = 2R$  and the noise figure is 2.0 (3 db.), because the noise power is doubled over that of the ideal receiver.

### Example 1:

Assume a perfect receiver of 6-kc. bandwidth and a 100-ohm antenna with no input circuit losses or set noise. What is the required input level at  $m = 0.3$  for a signal-plus-noise-to-noise ratio of 10 db.?

$$\text{If } \frac{S+N}{N} = 10, \frac{S}{N} = 9$$

$$\frac{S}{N} = \frac{(mE_c)^2}{4KT \Delta \text{ant } fR} = 9$$

$$E_c = 0.98 \text{ microvolts.}$$

If the receiver is matched to the antenna (which should be done in the practical case), then the noise is 3 db. greater and, to preserve the same signal-to-noise ratio, the signal must increase 3 db.

$$E_c = 0.98 \times 1.4 = 1.39 \text{ microvolts.}$$

### Example 2:

Suppose the receiver of Example 1 was found to have a signal-plus-noise-to-noise ratio of 10 db. with an input of 1.8 microvolts in a matched case. What is the noise figure?

From Example 1:  $1.39 \times 10^{-6}$  volts for  $N.F. = 3$  db.

$$N.F. = 3 + 20 \log \frac{1.8}{1.39} = 5.2 \text{ db.}$$

## Grounded-Grid

(Continued from page 36)

near cut-off. An oscilloscope is necessary for proper adjustment. With the 'scope connected to the r.f. output of the linear the loading, bias and excitation should be adjusted until the waveshape of a 400-cycle tone is a replica of the same tone being applied to the driver. When modulation is removed the amplifier input should not vary and the height of the r.f. envelope on the 'scope should be reduced to half the full-modulated size. For adjustment with single-sideband exciters refer to the 1954 ARRL *Handbook*.

A copper plated, expanded steel shield was used over the top of the chassis and no TVI complaints have been filed.

Don't forget that every point in this circuit contains potentially dangerous r.f. or d.c. power. Pull out the wall plug before monkeying with the works.

The final test is an 8 P.M. CQ on forty. The blast of QRM answering on your frequency is very satisfactory!

## FEED-BACK

The following errors have been detected in Burns, "Sideband Filters Using Crystals," in the November, 1954, issue:

Page 39, reference 14, should be *Electrical Communications*, December, 1949.

Page 148, seven lines from the bottom of the column,  $C_c$  should appear instead of one of the  $C_{D's}$ .

Page 150, third line, replace  $C_c$  with  $C_D$ .

Page 150,  $f_{L2C2}$  and  $f_{L3C3}$  in the equations of Appendix I should each have an exponent "2." In other words, the correct values will be the square roots of those determined by the formulae as shown.

M. R. BRIGGS, A HAM OPERATOR FOR 35 YEARS, IS MANAGER OF MISSILE  
GROUND CONTROL ENGINEERING, WESTINGHOUSE ELECTRONICS DIVISION

# ALL ELECTRONIC ENGINEERS WITH A DESIRE TO CREATE!

The building of a ham station is an outlet for some of our creativeness. In the 35 years I've been a ham operator, I've found a lot of satisfaction in my hobby; but nothing gives me more creative pleasure than my job.

At the Westinghouse Electronics Division, creativeness is encouraged. Important, too, is the fact that the work is so vital! We're working on advanced development projects that are both interesting and challenging! For the expansion of these projects we are looking for electronic engineers experienced in radar and Missile Guidance Systems.

Of course, Westinghouse offers the finest income and benefit advantages, as well as a good location. You'll find ideal suburban living accommodations and many big-city attractions.

If you'd like more information on the high-level openings to be filled in the near future, drop us a line today!

R. M. Swisher, Jr.  
Employment Supervisor, Dept. 34

## In this top rated rig TVI is sealed in with METEX Electronic Weatherstrip

Viking Ranger

This inexpensive product will do the same for your own rigs. Follow the lead of Johnson and other high placed manufacturers.

For sealing your own rigs or any consumer, industrial or military equipment against RF leakage METEX Electronic Weatherstrip is highly effective and is a simple operation. It's made of highly resilient compressed knitted wire which comes in several forms to meet all normal requirements even where closure is of an uneven nature. Type TVI 20-S is easily applied to most rigs in the home workshop. METEX Electronic Weatherstrip is the simplest and most inexpensive method for sealing in RF leakage yet devised. Try it. Results are amazing. Ham and industrial inquiries invited.

## Noise Reduction

(Continued from page 37)

really big advantage of the traps is that they do not interfere with motor performance. The decreased motor performance will bother the amateur who loves his car, as he does his ham rig. Here in the Cumberland Mountains, the loss in power on grades when suppressors were used was distinctly noticeable.

The traps are easily constructed, and the mounting problem solved, by drilling through standard commercial suppressors to open their resistance (not strictly necessary, but it will increase the  $Q$  of the circuit), and then winding the coils around them. If no grid-dipper is available, 7 turns of No. 20 wire, close-wound, tuned with a 50- $\mu$ f. disk ceramic condenser, will be effective over the entire ten- and eleven-meter bands. If only one-band operation is desired, these traps are well worth the effort spent in constructing them. Similar traps should effectively solve your noise problems in circuits where simple by-passing fails.

In case anyone is worried about it, removal of the suppressors did not result in an increase in noise on the b.c. band.

## CASCADE CRYSTAL CONTROLLED CONVERTER

for 144 or 220 Mc.

### Provides:

- **HIGH SENSITIVITY** — Sensitivity better than 1/10 microvolt. Gain approx. 30 db. Noise approx. 4 db.
- **COMPLETELY STABLE**. C.W. on 144 mc. NO mechanical modulation. Pure D.C. note. No drift.
- **RUGGEDLY BUILT** — Suitable for mobile application.
- **USE WITH ANY COMMUNICATIONS RECEIVER** — Availability with output at I.F. frequencies 6-10 mc., 8-12 mc., 10-14 mc., 12-16 mc., 14-18 mc. We recommend use at I.F. output 14-18 mc.
- **COMPLETELY SHIELDED** — In beautifully finished silver gray hammett steel case.
- Available (SPECIAL ORDER) for other CD or industrial frequencies. Also available for Collins receiver.
- **USES 6BZ7, 2 — 6CB6, 2 — 6J6 tubes. COMPLETE** with plugs, tubes and crystal..... **\$42.50**
- **Kit Form. Complete.**..... **\$29.75**

# LAFAYETTE'S SPECTACULAR MULTITESTER VALUES

## Lafayette Greatest Tape Buy Ever!

1200 FT. REEL  
Genuine Plastic Base  
**RECORDING TAPE**  
Shpg. Wt. 14 oz.

LAFAYETTE made a terrific deal with one of the leading manufacturers of recording tape to supply us with their regular tape which sells for almost twice our price. **WE GUARANTEE ABSOLUTE SATISFACTION OR YOUR MONEY BACK.** The finest, professional-quality recording tape obtainable. Highest performance for thousands of playings. Red Oxide Base in a smooth, uniform coating; greater signal strength; with maximum fidelity; uniform frequency response from 40-15,000 cps.

**\$1.89** per roll plus postage (C.O.D. accepted)

In lots of 10 rolls - **1.75 ea**

## CARDWELL UHF CONVERTER SALE!

List **42.50**  
Net **13.95 ea.**  
Lots of 3

Singly **14.45 ea.**

Outstanding Value! The Cardwell ES-1 UHF converter covers the entire UHF spectrum—channels 11-83. Has 6AF1 oscillator, 6CB6 IF amplifier and 1N72 crystal diode. Features printed circuit oscillator; high overall gain (3 to 4 times), high sensitivity, constant L/C ratio tuner, 25-1 gear drive. Has AC cord and plug, 3-pcs. switch for UHF, VHF and OFF. Handsome wood cabinet 8 3/4" x 6 1/2" x 3 1/4" with easy reading dial. Shpg. Wt. 4 1/2 lbs.

CARDWELL ES-1 Converter—Lots of 3 each..... **13.95**  
Singly each..... **14.45**

## SARKES TARZIAN VHF TUNER

Latest Type  
Complete  
With 2  
Tubes

Brand new—covers entire VHF spectrum. It is an exact duplicate of thousands now in use in many chassis including the Sylvania 510 and 520 series. Has 7" long concentric shafts. Excellent gain, noise factor, image and I.F. rejection. For 40 mc. IF systems. Complete with 6BC5 and 6X8 tubes and shields. Shpg. Wt. 4 lbs. Worth 3 times the price!

TL-24—In lots of 3 each..... **4.45**  
Singly each..... **4.95**

**PRECISION DRAFTING SET**  
11 Pieces—Fitted Felt-Lined Case  
Made in Germany, of heavy brass, nickel plated and polished. Instruments include 3/4" Compass with pencil and pen points and lengthening bar, 5/8" Divider, three 3 1/2" sidewheel bow dividers with needle point, pen point and pencil point. 5" Ruling pen, extra handle for pen or pencil, capsule with extra leads. Interchangeability of these many parts makes this an exceptionally versatile set. Your money back—if this set is not worth twice our price!

## HIGH SENSITIVITY AC-DC MULTITESTER 20,000 ohms per Volt

The new Lafayette High Sensitivity Multitester is a complete instrument (not a kit). Here is an instrument packed with every desirable feature found only in instruments costing twice as much. One of the most sensitive multitesters ever offered. **20,000 ohms per volt DC; 5,000 ohms AC**, having a high sensitivity 15 microamps meter. Full scale AC-100 voltage ranges are 0-10V, 0-50V, 0-250V, 0-500V, 0-1000V; DC current ranges 50 microamps, 2.5 ma, 25 ma, 250 ma. Resistance: 0-5K ohms, 0-50K ohms, 0-500K and 0-5 megohms. Decibel range: -20 +5 db; +5 +22 db (0 db -0.75V -600 ohms). Extreme versatility and accuracy. 1/2" precision resistors; 3" meter; beautiful plastic front, with metal bottom for ruggedness. Size: 3 3/4" x 5 1/2" x 2 1/2". Complete with batteries and leads. Shpg. Wt. 4 lbs.

## NEW POCKET AC-DC VOM MULTITESTER 1,000 ohms per Volt

This instrument is one of the best buys that Lafayette has ever offered in a Wide Range AC-DC MULTITESTER. An ideal portable unit that meets the need for a compact, yet rugged test instrument. Has ease of operation usually **FOUND ONLY IN MORE EXPENSIVE INSTRUMENTS.** Has 1000 ohms/volt sensitivity on both AC or DC. Uses full 3" rectangular meter with large easy to read scale. Uses 1/2" precision resistors, jeweled D'Arsonval microamp meter movement. Ranges: AC-DC and output volts 0-5, 0-25, 0-250, 0-1000V; DC current 0-1, 0-10, 0-100, mA; Resistance 0-10K and 0-100K ohms. In handsome sturdy bakelite case. Size: 4 1/2" x 3 1/4" x 1 1/2". Supplied Complete with test leads and batteries. A Must for every serviceman, shop, Laboratory or experimenter—and at Lafayette's Price you can afford to own one. Shpg. Wt. 2 1/2 lbs.

### GONSET COMPANY

801 S. Main Street, Burbank, California

## DX Competition

(Continued from page 67)

c.w. section is 18, and contacts made on the same band with the same country after the quota is filled will not count. Thus complete exchanges with 6 stations in one country on one band fill the band quota for that country. The maximum number of points per country per band which may be earned by VE/VO stations in the c.w. section is 24, and contacts made on the same band with the same country after the quota is filled will not count. Exchanges with 8 stations in one country on one band are thus permitted Canadian participants. There is *no quota* for stations in the c.w. section outside of the U. S. and Canada. There is *no quota* for any station in the 'phone section.

11) *Reporting*: Contest work must be reported as shown in the sample form. Each entry must include the signed statement as shown in that example. Contest reports must be mailed no later than April 29, 1955, to be eligible for QST listing and awards. All DX Contest reports become the property of the American Radio Relay League. No contest reports can be returned.

12) *Awards*: To document the performance of participants in the Twenty-First ARRL International DX Competition, a full report will be carried in QST. In addition, special recognition will be made as follows:

a) A certificate will be awarded to the high scoring single-operator 'phone and to the high-scoring single-operator c.w. entrant in each country (as shown in the ARRL Countries List) and in each of the 73 U. S. and Canadian ARRL sections (see page 6 of this issue) from which valid entries are received. In addition, a certificate will be awarded to the high scoring multiple-operator station in each section or country from which three or more valid multiple-operator entries are received.

b) A suitable certificate will be awarded to the operator making the highest single-operator 'phone score in each ARRL-affiliated club, provided the club secretary submits a listing of a minimum of three 'phone entries by bona fide resident members of such club, and provided further that these scores are confirmed by receipt at ARRL headquarters of the individual contest logs from such members. The highest single-operator c.w. scorer in each club will be awarded a certificate under the same conditions.

c) ARRL will award a gavel to the affiliated club submitting the greatest aggregate 'phone and c.w. score by bona fide resident club members, whether single- or multiple-operator entries, provided such scores are confirmed by receipt at ARRL headquarters of the individual contest logs from such members.

13) *Judges*: All entries will be passed upon by the ARRL Award Committee, whose decisions will be final. The Committee will void or adjust entries as its interpretation of these rules may require.

14) *Disqualifications*: Each participant agrees to observe the contest rules as well as all regulations established for amateur radio in his country. Some examples of grounds for disqualification are: off-frequency operation as confirmed by a single FCC citation or advisory notice or two ARRL accredited Official Observer measurements; low tone reports in logs; working countries on the "banned list" — footnote information applies to U. S. A. amateurs only.

<sup>1</sup> As we go to press, prefixes to be avoided are F18, PK (except PK7), EP-EQ, HL, HS, 3W8 and XW8.

## Strays

Patience, practice and persistence have paid off for W3TOC of Etna, Pa. Licensed as a Novice three years ago, he qualified for his General Class license in November. Suddenly stricken by blindness sixteen years ago, the code was quite an obstacle. Bill isn't resting on his laurels, though — he's now busy helping five blind friends become hams!

# where to buy it?

## you can make your best deal at Burghardt's

**Terrific Trade-Ins**—As liberal as anyone in the country... and yours may be worth more at Burghardt's. Trade-ins usually cover down payment on your new gear.

**10% Down—Easy Terms**—10% down lets you "take it away." Up to 18 months to pay on balances over \$200. Burghardt's own financing saves you money—lets us adjust terms to your budget. All time payments based on 1/2 of 1% per month based on original unpaid balance. Full payment within 90 days will cancel all interest or carrying charges.

**Speedy Delivery—Personal Attention**—No order too large or small for personal attention. All inquiries acknowledged and orders processed day received.

**Prepaid Shipping**—Here's a real money-saver. All orders totaling \$50 or more net, after trade-in allowances, will be shipped to you prepaid!

100% Guarantee

**Satisfaction Guaranteed**  
or your money refunded  
after 10 day trial.

**VIKING KILOWATT POWER AMPLIFIER**—The new Viking Kilowatt has every conceivable feature for safety, operating convenience, and peak performance. Low power or maximum legal input AM, CW, or SSB may be selected with the flip of a single switch. Tuning is continuous over the range 3.5 to 30 mc. with no coil change necessary. A compact pedestal contains the complete unit, including RF power amplifier, modulator, power supplies, and all control equipment. This unit rolls out of the pedestal, providing complete accessibility to all electrical components for adjustment or maintenance. Excitation requirements are 30 watts RF and 15 watts audio for AM and 10 watts peak for SSB. The Viking "Ranger" transmitter/exciter (shown above) is an ideal RF and audio driver for AM and CW, and the new Viking SSB transmitter/exciter will drive the Viking Kilowatt to full output on SSB.

**Viking Kilowatt Power Amplifier**—wired, tested, complete with tubes... Only \$159.50 down ... \$86.92 per mo. for 18 months.

**Viking Kilowatt** complete with Matching Accessory Desk Top and 3 drawer pedestal ... Only \$171.88 down ... \$93.65 for 18 months.

**VIKING RANGER**—A rugged, compact transmitter—the Ranger may also be used as a flexible exciter unit without modification. As an exciter it will drive any of the popular kilowatt level tubes and provides a high quality speech driver system for high powered modulators. As a transmitter it is a self-contained 75 watt CW or 65 watt phone input unit with 100% AM modulation, 10 through 160 meter amateur bands. Extremely stable, built-in VFO—or may be crystal controlled.

**Viking Ranger Kit**, less tubes, crystals, key, and mike ... \$17.95 down

Also available wired and tested, less tubes ... Only \$25.80 down

**VIKING II TRANSMITTER**—TVI suppressed. All amateur bands from 10 to 160 meters, 100 watts phone output, 130 watts CW. Instant band-switching—VFO input provision—dual power supplies. All stages metered. Pi-network coupling output amplifier. Self-contained—no plug-in coils. 100% amplitude modulation.

**Viking II Transmitter Kit** complete with tubes, less crystals, key, and mike ... \$27.95 down

Also available wired and tested ... Only \$33.70 down ... \$18.36 for 18 months.

**VIKING ADVENTURER**—Big transmitter features in a new, compact CW kit. Single-knob bandswitching 80 through 10 meters—50 watts input—TVI suppressed. Easy to assemble and operate. Self-contained power supply wired for use as "extra" station power source when transmitter is not in use. Clean, crisp break-in keying.

**Viking Adventurer Kit** with tubes, less crystals and key ... \$5.45 down

**VIKING VFO KIT**—Variable frequency oscillator with 160 and 40 meter output for frequency multiplying transmitters.

**Viking VFO Kit** ... \$4.25 down

**Viking VFO** wired and tested, with tubes ... Only \$6.40 down ... \$5.06 for 12 months.

**VIKING "MATCHBOX"**—Performs all antenna loading and switching functions required in most medium power Amateur stations. Only \$4.95 down ... \$7.70 for 6 months.

**TOP TRADE-INS**—10% cash discount on the following with no trade:

## World Above 50 Mc.

(Continued from page 56)

simple means for obtaining a c.w. beat note with receivers like the 522 and Gonset Communicator. W6NOB suggests a b.f.o. method that may not have occurred to some owners of these receivers. He has a Command transmitter hooked up near his Communicator. Turning on this unit and tuning it so that it beats with the Communicator i.f. does the trick very nicely. A simple crystal oscillator on a frequency about 1000 kc. away from the receiver i.f. will also do.

Such makeshifts will allow you to copy the c.w. sigs you hear, but remember that they will not give you a full appreciation of the value of c.w. in weak-signal reception until you go to the higher selectivity that c.w. makes possible. Narrow the passband down to a few hundred cycles and you'll be amazed to hear the way the readability of weak c.w. shoots up. This, however, also shows that the tunable oscillators in these receivers are rather unstable. The next step is, of course, a crystal-controlled converter, a must for any real 2-meter DX enthusiast.

### SPRINGER MODEL ARSG SIGNAL GENERATOR NOISE DIODE TYPE

Length—6½" Dia.—1½" Weight—12 oz.

- Self contained, operates with Burgess Z4, 6 volt battery.
- Ideal for receiver sensitivity checks and "Touch Up" alignment to improve signal to noise ratio of AM receiving equipment.
- Generator signal output connection provided thru 24" length of 52 ohm concentric line.
- Average maximum signal output level of generator is 15 microvolts.
- Calibrated linear dial provided for output control.

**EARL W. SPRINGER AIRCRAFT RADIO CO.**  
Sky Harbor Airport, Route 11, Box 330  
INDIANAPOLIS 19, INDIANA

## U. S. N. R.

An ardent amateur radio operator is the commanding officer of Naval Reserve Electronics Division 8-12, Paris, Texas, which won the Hooper trophy in national competition for excellence in Naval Reserve electronics training. He is Cmdr. Paul H. Daniels, USNR, W5CTM. He has held an active amateur license for 30 years and a commercial license for 28 years.

Cmdr. Daniels' interest in amateur radio activities helped him to progress rapidly in the Naval Reserve. He enlisted as a radioman first class in 1931. Three years later he was chief petty officer in charge of USNR Communication Reserve Unit No. 7, Junction City, Kans. At that time he was discharged to accept a commission as ensign in the Naval Reserve. He reported for active duty to the Commandant, Norfolk Navy Yard, as assistant communications officer in April, 1941.

Cmdr. Paul H.  
Daniels, USNR.

During World War II Cmdr. Daniels served on the staff of Commander, Operational Training Command, U. S. Atlantic Fleet. In 1947 he was designated to command Volunteer Electronics Warfare Company 9-146, Emporia, Kans. He was relieved of command when he moved to Paris in 1949. Cmdr. Daniels was assigned to Volunteer Electronics Warfare Company 8-51, Paris, as training officer. He assumed command of the company in August, 1950. On deactivation of the volunteer company in 1951 and activation of Organized Electronics Company 8-12, Cmdr. Daniels was named commanding officer.

He has made his hobby his profession. In civilian life, he is chief engineer for the Paris radio station, KPLT.

Six members of Naval Reserve Electronics Platoon 8-50, Clarksville, Ark., hold amateur radio licenses. They are Lt. James K. Harrison, W5WXN, officer in charge; Russell E. Murray, CWO, W5VUL; Phillip B. Latimer, ETC, W5JPY; Grover F. Krohn, ATC, W5SXM; Frank Carl Eichenberger, SA, W5WUP; and Joseph V. Murray, SN, WN5BGX. W5WXN, WN5BGX, and W5WUP obtained their General Class licenses through membership and training in the Clarksville unit.

Last year W5JPY organized a code class for members of a Boy Scout troop to qualify them for a code merit badge. Eight scouts continued their study and four now hold Novice licenses.

### New "TENACLIP" (Pat. Pend.) attaches to car... stops antenna whipping

Clear plastic clip quickly fastens to resin molding... holds right or left antennas. Prevents damage to antenna from low hanging limbs or driving into garage. See your dealer or order direct. No C.O.D.'s please.

## YL News and Views

(Continued from page 51)

for ham licenses. Eleanor was also elected president of the Unit for the coming term. . . . The daughter of W4MS, SCM of Western Florida, recently became K4AGM (Gwen). . . . YLs who attended the ARRL West Gulf Division Convention were W5s DEW EGD JAD KQG RYX SPV WXT YAJ. . . . Ten hours after the birth of her first child, KN6HJP, Laura Lee, began a series of two-meter QSOs from her hospital bed with OM KN6ELR at their home in Santa Barbara. The baby's pediatrician was K6CRJ (this item by way of OM K6ATX). . . . YLs who attended the October hamfest of the Federation of Long Island Radio Clubs were W2s EEO IGA JZX KDP MWY; K2s AFR CFF EBU; KN2JHIQ. . . . OM W3IIX points out an article in the *National Radio-TV News*, Oct.-Nov. '54 issue, which briefly describes the educational use of amateur radio by WSNEJ and XYL WSNEK, Marianne, in connection with their work on the Seney National Wildlife Refuge in Michigan. . . . The licensing of four more YLs who work at Headquarters (see photo, December *QST*, page 52) brings the total of YLs at 38 La Salle Road to ten, thanks in large measure to W1YYM, Ellen, who has conducted classes during lunch hour for months. Several of the girls who started as Novices have gone on to General or Technician Class licenses. Calls of the Headquarters girls are W1s YYM ZCS ZIB ZID ZIM ZJE; WN1s CIE CIJ CIM CLC.

### YLs You May Have Worked

Since acquiring her license in August, 1953, W0OMM, Donna Illosey, has worked various frequencies daily from morning until late at night. Active in RACES, a member of

W0OMM

the Independence Three Trails Radio Club, the Missouri Emergency Net, the Kansas Net, and the YLRL, Donna particularly likes to handle traffic going into Kansas City. She usually makes several telephone calls a day to deliver messages from servicemen and college students. Donna works 10, 20, 40, and 75. Her OM is W0QZY and her son is W0OMP.

### 1955 FIELD DAY DATES

ARRL is pleased to announce that the 1955 Field Day will be held the week end of June 25th and 26th. Whether you plan to participate with a club or on an individual basis, it's not too early to start thinking about Field Day. Watch *QST* for complete rules.

## Correspondence

(Continued from page 50)

### FOGEY

8637 9th Court So.  
Birmingham 6, Ala.

Editor, QST:

Keep up the good work ("Fulminatin's from Ol' Fogey," Nov. QST). To me, a great deal of the pleasure of amateur radio operating is gone today because of the sloppy techniques that are in use—even in my favorite game of traffic handling. . . .

— Marc Molyneux, jr., W4MVM

1917 Glenview  
Park Ridge, Ill.

Editor, QST:

. . . Such articles as "Fogey's" are very exasperating to me; you may as well devote the space to advertising. . . .

— Jim Strandberg, W9JBZ

### SEEK YOU

Rice Rd., R.R. No. 2  
East Aurora, N. Y.

Editor, QST:

I just got my Novice about two months ago, and am I ever having fun!

One thing which is very noticeable on the Novice band is the time spent on calling CQ. A lot of the Novices call CQ ten times or more before giving their call. I feel that a CQ consisting of CQ three times, the call three times, and then that again is very adequate. Also, after making a contact with a station it is only necessary to give his call and sign yours once, or at the most twice. I am quite sure that when someone calls CQ for a seemingly endless period of time, he loses contacts because a lot of people don't want to wait until the call letters come around.

So, Novices, let's make our CQs a little shorter, thus our QSOs a little more interesting and numerous.

— Nancy Townsend, KN2JIR

### PI-NET SAFEGUARD

Chatham, Mass.

Editor, QST:

There are many transmitter circuits in QST and the Handbook which use a pi-network output circuit. In most of these circuits danger exists in case of failure of the d.c. blocking condenser. This can place the d.c. plate voltage on the antenna and feeder. In commercial designs this possibility is anticipated and protection provided by the use of an r.f. choke between the output terminal and ground. Examples of circuits in which this danger could exist may be found in Dec. 1953 QST, p. 18, June 1954 QST, p. 18, and the 1952 Handbook, pages 171, 156, 138.

After giving a little thought to this situation I think you will agree that you should bring this point to the attention of readers of your publications.

This problem is not based on theory only. I know of an instance where a serious shock resulted.

— William C. Ryder, W1JNM

[Editor's Note — This source of danger has been recognized in the ARRL Safety Code which appeared in the June, 1952, issue of QST. This measure also reduces the peak voltage across both input and output condensers, since it provides a d.c. short across the capacitors. Since the failure of the blocking condenser may cause the choke to burn out, the primary of the plate transformer should be fused, not only as a measure of personal safety, but also to save the equipment.]

### HAMFEST CALENDAR

**District of Columbia** — The Old Timers Club of the Washington and Baltimore area will hold their winter dinner and meeting the third Saturday in February in Washington, D. C. Tickets for the event will be \$3 per person, and reservations may be obtained from Dr. A. J. Dalton, 1007 Paul Drive, Rockville, Maryland.

## Army-Air Force Observe MARS Sixth Anniversary

The Military Affiliate Radio System has entered upon its seventh year of operation. MARS will continue to emphasize the training of amateur radio operators who want to learn more about military radio practices and procedures.

Efforts are being made to establish an effective in-place system which can be made available

Maj. General Back

Maj. General Blake

to military commanders for planned use in the event of peacetime disaster or national emergency.

The Chief Signal Officer, U. S. Army, and the Director of Communications, U. S. Air Force, sent the following message to all MARS members on the anniversary date:

SPECIAL BROADCAST — 26 NOVEMBER 1954

To All MARS Members

The Sixth Anniversary of the Military Affiliate Radio System, 26 November 1954, marks another year of integrated radio operation and training between Army and Air Force communications and United States licensed amateur radio operators. Events of the past year have proved that military unit stations at Army and Air Force Bases can be netted with personally-owned and operated amateur facilities to provide a reliable system for training and for MARS administrative traffic. Personal messages handled for Armed Forces personnel and their families and friends have contributed to the high morale of our servicemen everywhere. The Chief Signal Officer and the Director of Communications unite in extending sincere thanks for your loyalty and support. We urge you to continue to carry on the advancement of MARS. Sgd Major General George I. Back, Chief Signal Officer, United States Army; and Major General Gordon A. Blake, Director of Communications, United States Air Force.

## New **FREED** COMPONENTS for HI-FIDELITY AMPLIFIER PROVIDE IMPROVED PERFORMANCE

This Freed circuit incorporates several changes from the original Williamson circuit to provide optimum performance at high and low frequency extremes. It is rated at 10 watts with triode connected output tubes. However, by connecting the screen grids of these tubes to taps provided on the Freed KA-10 output transformer, it is possible to double the power output for a given distortion percentage.

Recommended power supply is choke-input type with a two-section L-C filter to maintain constant D.C. output and to improve filtering to the voltage amplifiers.

Other high quality Freed components include miniature audio transformers, magnetic amplifiers, toroidal inductors, subminiature encapsulated pulse transformers, precision filters and a complete line of precision laboratory test instruments. Complete catalogs are available to engineers requesting same on firm letterheads.

Freed components required  
for this amplifier include:

FREED KP-10 POWER TRANSFORMER  
FREED KA-10 OUTPUT TRANSFORMER  
FREED KC-10 FILTER REACTOR  
FREED KC-11 FILTER REACTOR

# Be *Sure* of Your Transmitter to Antenna Match with the new **CoAx Ratiometer** (S.W.R.)

Install a CoAx Ratiometer in the line between your transmitter and antenna (or tuner) and stop guessing at a proper match. In this new device, well-established principles are applied to produce a unique answer to the problem of measuring standing wave ratios. The result is a design of exceptional accuracy and simplicity.

There are no condensers to balance, no resistors in line to dissipate your power. The unit handles frequencies from 2 to 200 MCS, power loads from 10 to 1000 watts (so it can't be overloaded). Rugged construction, but so compact it can easily be permanently installed inside your transmitter. Free mounting bracket included with every unit.

Sensing unit may be purchased with or without the easy-to-read remote indicator. Complete instructions include how to make your own remote indicator. See your favorite distributor today. If he hasn't heard about the CoAx Ratiometer, send us his name and your check. We'll ship direct to you, postpaid.

# HAM-ADS

(1) Advertising shall pertain to radio and shall be of nature of interest to radio amateurs or experimenters in their pursuit of the art.  
(2) No display of any character will be accepted, nor can any special typographical arrangement, such as all or part capital letters be used which would tend to make one advertisement stand out from the others. No Box Reply Service can be maintained in these columns.  
(3) The Ham-Ad rate is 30¢ per word, except as noted in paragraph (6) below.

(4) Remittance in full must accompany copy. No cash or contract discount or agency commission will be allowed.  
(5) Closing date for Ham-Ads is the 20th of the second month preceding publication date.

(6) A special rate of 7¢ per word will apply to advertising which, in our judgment, is obviously non-commercial in nature, and is placed and signed by a member of the American Radio Relay League. Thus, advertising of bona fide surplus equipment owned, used and for sale by an individual or apparatus offered for exchange or advertising inquiring for special equipment, if by a member of the American Radio Relay League take the 7¢ rate. An attempt to deal in apparatus in quantity for profit, even if by an individual, is commercial and all advertising by him takes the 30¢ rate. Provisions of paragraphs (1), (2) and (5), apply to all advertising in this column regardless of which rate may apply.  
(7) Because error is more easily avoided, it is requested signature and address be printed plainly. Typewritten copy preferred.

(8) No advertiser may use more than 100 words in any issue no more than one ad in one issue.

*Having made no investigation of the advertisers in the classified columns, the publishers of QST are unable to vouch for their integrity or for the grade or character of the products or services advertised.*

**QUARTZ**—Direct importers from Brazil of best quality pure quartz suitable for making piezo-electric crystals. Diamond Drill Carbon Co., 248 Madison Ave., New York City 16.

STILL the biggest list of ham gear for a three-cent stamp. Receivers, transmitter, parts, meters, rotators, the accumulation of a lifetime. Want coax switches, relays, rotary inductors, Collins 75A3, cash or trade. W0ERU, 2511 Burrmont Road, Rockford, Ill.

WANTED: 250-300 watt modulator or parts. Paul Powell, 801 Matamoros, Laredo, Texas.

VIKING I Transmitter, in excellent condition, complete TVI, \$150.00. Cannot pack or ship. Ernest E. Plant, W2GDL, 47-37 189th St., Flushing, N. Y. Flushing 7-7510.

SELL: Eldico TR75-TV transmitter with coils for 10 through 80 meters, \$45.00; Eldico 40-watt modulator, \$30.00; Meissner EX VFO all bands, \$50.00. All equipment in excellent condition, Paul Juliff, W1SWO, Choate School, Wallingford, Conn.

COLLINS 32V-3, fine condition, \$565. W0VTP, 8506 Broadmoor Dr., Omaha, Nebr.

NEW Crystals for all commercial services at economical prices; also regrinding or replacement crystals for broadcast, Link, Motorola, G. E. and other such types. Over 19 years of satisfaction and fast service. Send for L-7 catalog. Eidson Electronic Co. Temple, Texas.

MORROW SBR, newest, used a few hours, \$64.00; \$40A and SM40 "s" meter, gnd condn, \$63. Sylvan TR2-144, new 2-meter 100 watt trans., \$25; Pads FM tuner, new, \$15, same used, \$12. Want SP44 Panadapter and mod. trans. for pr 811A or 5514. W2HDR, John A. Schwerbel, 111 W. Hoffman Ave., Lindenhurst, L. I., N. Y.

SELL: QSTs 1925-1939 inclusive except for 4 issues, in excellent condition, make offer; HRO B.C. coil, \$5; four 24G's, \$1.00 each; 4A A-13 Mod. trans., \$100V, \$7.50; 5 Mc. xtal, \$2.50. D. L. Robinson, 1609 Westview Drive, New Kensington, Pa.

FOR Sale: Collins 32V1 transmitter, \$300. Approximate 500 watt final transmitter with modulator, best offer. Audio amplifier, 60 watt, \$30; Elmac A54 transmitter with power supply, \$100; Elmac PMR 6A receiver with power supplies, \$100. Goldie Farrell, 912 Noyes Ave., Hamilton, Ohio. Phone 4-6780 or 3-6557.

PRINTED Circuits: Make your own etched wiring for transmitters, receivers, etc. Simple process. No silk screens or photographic plates. Kit contains all materials and illustrated instructions. Send \$2.95 now. Felix Dutko, 2078 Vyse Ave., Bronx, N. Y.

SELL: Variacs, 5 amp, \$5, 45 amp, \$50; new BC-459A, BC457A, \$5. All trans., 1000, 65 amp, \$10; Mine detector SC825, \$30. ARCA Rk. TX, \$20; 75 meter mobile station, \$90; Thordarson 21M64 300W mod. xfrmr, \$20; HQ129X, NC4173, Wand 75A, W6WZD.

FOR Sale: Elmac AF-67, \$145; Gonset Super Six, \$42; both two weeks old, used only 1/2 hour. A steal. . . . Also PE103, \$14; 660 all-bander coil, \$11.00, W8NYA, Laferty, 917 South Shore, Holland, Mich.

SELL: HQ129X, Gonset Communicator with squelch, Telrad frequency standard, unmodified BC522 receiver, modified BC522 receiver, AR-13 Mod. trans., 100V, \$7.50; National oscilloscope with internal sweep circuit. Best offers, W2DCQ.

SELL: Navy long wave receiver 600 to 15 Kc, \$35.00, W4OF.

FOR Sale: 450TH and 808 power tubes, new, never used. Other equipment also. Write Donald Pratt, Harpersville, N. Y. CRYSTALS: FT-243's, 3500 to 870 Kc  $\pm$  5 Kc, \$1.00 each. All C.A.P. frequencies. Prices range like 4507.5, 4385, 4467.5, 8008.2, 8230, \$2.50 each, .005% setting. Hundley Crystal Co., 2951 North 36th, Kansas City 4, Kans.

A.C. Instructograph, 10 tapes, built-in oscillator, instructions. Hardly used. Best offer over \$35.00. K2GMA, Michael August, 10 Rahway Rd., Millburn, N. J.

SELL: AR-13, modified, 110v. power supply. Emission switch controls remote 24VDC, 24 VAC, 450V, 1500 V @ 500 mill supplies. Complete with spare 813, 1625, Tech, manual, schematic showing modifications, power supply, cable connections, de-TV'd. On air. Best offer. SCR-522 with tubes, \$35.00, BC-342, new paint, knobs, markings. Rear connections for speaker, converter, antenna, ground, send/receive. Modified per QST Sep. 46. Best offer, J. R. Divers, Jr., W4JVM, Rt. 4, Chattanooga, Tenn.

SELL: Johnson Viking II factory-wired and VFO 1 1/2 year old. In A-1 condition, \$310. Ernest Nettum, W0PVG, Kindred, No. Dakota.

FOR Sale: TR-75TV coils, 10, 20, 40, extra grid coil, \$40; MB-40, unused tuner, \$9; JCX50E, \$5; DM-36B, 6-10 converter, \$13; \$14.50, \$2, \$5, \$1.50; W5RJB, Seyler, 3286 Rinda Lane, Cincinnati 22, Ohio.

REFLECTORIZED aluminum call sign. Regular \$1.50. Jumbo, \$2.00. Lawn state, \$2.75. Overnight shipment. Whitley, W2LPJ, 133 Airsdale Ave., Long Branch, N. J.

NC-125 receiver, LYSCO 600 xmitter (no TVI), Clampmaster modulator and antenna coupler for highest bidder over \$200. WIBML, LeRoy Flatt, 19 Vernon Rd., Natick, Mass. Phone OL-38891.

SELL: 400-watt complete transmitter, 35Ts P.P., 6-ft. rack, \$150. R. Julien, Maryknoll P.O., N. Y.

VIBRAPACKS: Navy surplus, 6V input, 250v at 165 Ma. output. Filtered, fused and with control relay. New, \$15.95. Kit of basic components to build above unit, less chassis with diagram, \$6.95. Drillick Electronic Sales Co., 5279 W. Pico Blvd. Los Angeles 19, Calif. Tel. WEbster 1-9202.

NOVICES: Hallcrafters S-38B. Good condition, \$25. Dave Lifton, 140 Beach 135th St., Rockaway Beach, L. I. N. Y.

DANGER! High Voltage! embossed metal signs, 3" x 12", baked enamel colors, \$1.00 each. W9WFT, Lackner, 2029C Bradley, Chicago 18, Ill.

TRANSMITTER 300 watts PP35Ts spares, relay rack enclosed cabinet, coils for 40, 20 and 10 Class B modulator, separate preamp, \$100. Make an offer local. Meck T60 xmitter, 60 watts, 10-meter coils. Phone or c.w., \$50. Val Brygnak, W8VDF, 668 E. 130th St., Cleveland 8, Ohio.

FOR Sale: NC98 revr, in original carton. First \$100 takes it. Dom Garofano, W3VMJ, 4332 Germantown Ave., Phila., 40, Pa.

LONG Island Hams! We have moved to a larger store! It's easy to get to. Plenty of parking space. Lots of bargains. Trade-ins taken. Algeradio Electronics Co., 236 N. Franklin St., Hempstead, L. I., N. Y.

TAPE Recorders accessories, Hi-Fi phonographs. Exceptional values. Cerston, 215 East 88th NYC 28.

FOR Sale: HT-9 with VFO, \$150; BC348 MOD for 110V, \$90; 851 vac tube, \$30; 67" black enclosed xmitter cabinet, \$25; 1 KW 11 v. fil. xformer, \$20; Gonset 10/11 converter, \$20; list of other old-style xmitter parts, meters, cords, xfrms, ckt bkrs and inst. Bks available. Want SSB equip. Lt. Col. Hiler, W2SQ/4, 280 Coral Drive, Eau Gallie, Fla.

FOR Sale or trade: Globe Scout 50-watt phone/c.w. transmitter. Used less than one year and complete with Balun coils and microphone. Completely bandswitching 160-10 M, \$85; T-69-20A Motorola 10M mobile transmitter including power-supply, control box and microphone, \$15.00. Gonset 10M converter, \$12.00. R. Hanson, 4609 Drew Ave., So., Minneapolis 10, Minn.

FOR Sale: NC-125, brand new, with spkr, \$130; Viking Ranger, complete with tubes, ready to operate, \$265, both for \$375. Eicor 5.8 volt 425 volt 375 Ma. dynamotor, new, \$20; five (5) 44td. 6000-volt filter condensers, \$12, each five, \$50. Neill A. Jennings, W4NWW, 1714 Friendly Road, Greensboro, N. C.

WANTED: Johnson or Mims rotator, complete. Panoramic adaptor, 3000/4000 volt filter condensers. Sell or swap: 450TLs, Eico VTVM DuMont 3" scope, LM, VHF152A, BC348, 805s, 4D32, 4-125A, 813s, Collins MBF. King, W7NRB, Box 488, Kirkland, Washington.

VIKING Ranger, like new, \$175. Will not ship. John Warner, W8GPT, West Unity, Ohio.

BC221 with chart, excellent, \$125. Meissner shifter, Model EX1 clean and stable, \$45. RME 10 and 5 converter, unmodified Mode DM36 like new, \$25. BC312, fair condition, \$25. Prices F.o.b. P.O. Box 691, Woodcliff Lake, New Jersey, or phone Parkridge 6-0591M.

SELL: BC-654, \$25; NC-183-R, \$185; 21A Teletype midjet tape printer with wiring diagram, \$45; Dumont #241 scope, \$275; Collins 30-J, 600 watt input phone and c.w. crystal controlled; 2-60 MC., \$30; NC-125, \$145; NC-100X, \$95; RHM 12 000 ohm relays, \$1.75. Want: ART-13, ARC-1, DY-12, BC-221, BC-342, APR-4 tuning units, technical manuals. Tom Howard, W1AFN, 46 Mt. Vernon St., Boston 8, Mass. Tel. Richmond 2-0916.

WANTED: Late model Gonset or Elmac mobile transmitter and receiver. Dr. Roger West, W4CPQ, P.O. Box 2423, Norfolk 1, Va.

HARVEY-WELLS DeLuxe TBS-50D with Bandmaster VFO, HB. power supply, Astatic JT-30 mike, Hallcrafters S40A, 75-watt antenna tuner w/10, 20, 40 and 80 JCL coils and changeover relay. All excellent condition. Best offer over \$200 or will trade on Viking II. Wm. C. Harnsberger, W4ZNT, 126 Shamrock Rd., Charlottesville, Va.

VIKING II, factory-wired, new in appearance and in first class condition, \$275. Fred E. Norton, 1450 Winchester Dr., Muskegon, Michigan.

Q5'ER, McMurdo-Silver, with power supply, \$18.00; Gonset Tri-Band, perfect, no holes, \$30; Stancor P-4086 transformer, 5 volts, 14 amperes, 10,000 volt insulation, \$11.00; unused 813s, \$7 or trade for 304TLs. W. T. Curtis, W21WS, R.D. #1, Jamesville, N. Y.

ALL models Elmac receivers, transmitters, power supplies in stock. All c.w. now c-a-c-a-y, beams, 6 and 12 volt dynamotors, \$29.50. Bob Wolfe, W3HDT, Bob Wolfe Electronics, 2506 Hoffman St., Baltimore 13, Md.

CLEANING house! Mobile equipment, NRI xmitter, BC454B with 110v. supply, components, etc. Write for list. W9FXD, Van Vickle, Box 25, Mount City, Mo.

SELL: Hallcrafters S-76 receiver with R-46 matching speaker, new, in perfect condition. Make an offer. Allan Turpin, W4ZXU/6, Deep Springs College, via Dyer, Nevada.

WANTED: All tubes, receiving, transmitting and industrial. Lab test and TS equipment and Selsyns. Carrier equipment CF-1A, CF-4, repeater CF-5, ARC3, BC221, BC610, BC611, BC614, BC729, BC939, BC739, BC191, BC375, BC131 and all tuning units. "TAB" 111 Liberty St., New York City.

BC-458 converted for 75-80 or 40 meters with modulator, power supply, either rig, \$50. New pair 813's, \$15.00; new 4D22, \$10; parts for pair of 811 modulators, includes AN/ART-13 transformers; misc. parts, power supplies, etc. Cleaning out at give-away prices. Seidman, W2GNZ, 1535 Longfellow, Bronx, N. Y.

FOR Sale: Signal slicer, \$37.50. Eico VTVM, \$22.50. HS33 headset, no plugs, \$1.25 each. Send for list of other parts. Want National ML40BS, W3FKI, E. Aicher, 737 Pine, Steelton, Penna.

SALE: 32V3, in tip-top condx. Little used, \$595. W3WPM, Col. F. L. Moore, Hq. AACs, DCS/O, Andrews AFB, Washington 25, D. C.

## The No. 90901 One Inch Instrumentation Oscilloscope

Miniaturized, packaged panel mounting cathode ray oscilloscope designed for use in instrumentation in place of the conventional "pointer type" moving coil meters uses the 1" 1CP1 tube. Panel bezel matches in size and type the standard 2" square meters. Magnitude, phase displacement, wave shape, etc. are constantly visible on scope screen.

## A good microphone can improve your results as much as a high gain antenna

Ever notice that two signals of the same "S meter" intensity sound differently? One is muddy, dull, a little hard to read—the sibilant letters like S and F almost alike. The other signal is sharp, clean and readable even in QRM and QRN—because there's usable intelligence. No mistake about the call or comments.

The greatest variation is in the microphone. A sharp peak adds no intelligibility but limits the modulation to that value. A peak of, say 6 db, which is usual in many ordinary microphones, will reduce voice power by HALF. Don't be fooled by a microphone that sounds "louder"—loudness by itself is not a criterion of performance; quite the contrary since it may indicate undesirable peaks.

An E-V microphone with smooth, peak-free response, replacing an inferior instrument, often will do more for a phone signal than a new antenna or increased power. As a further *plus*, of course, you get well-known E-V durability, style and performance. An E-V microphone, to raise stations, to carry through a QSO, is your best station investment.

Shown above are a few of the E-V microphones designed for effective communications. Amateur discount applies.

(upper left) Model 611 high output dynamic and Model 911 crystal. On-Off switch. List from \$25.50 to \$37.50

(upper right) Model 950 Cardax high-level crystal cardioid, with dual frequency response. On-Off switch. List, \$42.50

(lower left) Model 630 wide range, high output dynamic, with exclusive Acoustalloy diaphragm. On-Off switch. List, \$47.00

(center) Model 636 "Slimair" wide range dynamic. Pop-proof head. Acoustalloy diaphragm. On-Off switch optional. List, \$70.00

(lower right) Model 623 slim-type high output dynamic, with E-V Acoustalloy diaphragm. On-Off switch. List, \$49.50. Also Model 926 crystal, less switch and connector. List, \$24.50

(Other E-V microphones for mobile and aircraft communications, telecasting, broadcasting, recording, and public address.)

FOR ONLY

No other receiver at anywhere near the low price offers you these eight "high-priced" features: (1) Calibrated bandspread for 80, 40, 20, 15 and 11 meter bands (large 6" indirectly-lighted lucite scales). (2) Delayed A.V.C. (3) Higher sensitivity. (4) New miniature tubes used exclusively. (5) Antenna trimmer. (6) Better selectivity. (7) An extra tube (total of eight plus rect.). (8) More compact.

For complete catalog of National receivers, write to Dept. Q 155.

**\$119<sup>95</sup>**

Calibrated bandspread for 80, 40, 20, 15, 11 and 10 meter bands (large 6" indirectly-lighted lucite scales).

Advanced A.C. superhet circuit uses 8 high gain miniature tubes plus rectifier

Covers 540 kcs. to 40 mcs. in 4 bands

Tuned R.F. stage

Two I.F. stages

Two audio stages with phono input and 2-position tone control

Antenna trimmer

Separate high frequency oscillator

Sensitivity control

Series valve noise limiter

Delayed A.V.C.

Headphone jack

Standby-receive switch

Conelrad(CD) frequencies clearly marked

## WITH THE RCA-6524

A new, low-cost twin beam power tube for "ham" use in the 420-450 Mc band

**RCA-6524—Max. Plate Input and Voltage vs. Frequency (Push-pull, Class C Operation)**

Service (ICAS)	Frequency Band Mc	Plate Input Watts	Plate Voltage (Volts)
Plate-Modulated Telephony	144-148	49	435
	220-225	44	370
	420-450	31	300
Telegraphy (CW)	144-148	78	540
	220-225	68	460
	420-450	47	380
Frequency Tripler	144-148	46	380
	220-225	40	370
	420-450	35	370

If you are planning a new rig for fixed or mobile operation in the 420-450 Mc range, the new RCA-6524 is the tube you want. The high power sensitivity and high efficiency of the 6524 permit operation with moderate plate voltages to give large power output with small driving power. In cw service, the tube will take 45 watts input (ICAS) at 470 Mc. (See table for Ham-Band ratings.)

Design features of the 6524 include balanced compact beam power units which have low interelectrode capacitances, and a cathode common to the two units to reduce cathode inductance to a minimum. High-conductivity seals and short, heavy, internal leads minimize rf losses.

The 6524 is available now. Ask your local RCA Tube Distributor about it. For technical bulletin, write to RCA, Commercial Engineering, Section A37M, Harrison, New Jersey.

THE STANDARD OF COMPARISON FOR OVER 20 YEARS

# HIGH FIDELITY TRANSFORMERS

FROM STOCK... ITEMS BELOW AND 650 OTHERS IN OUR CATALOGUE B.

## TYPICAL UNITS

### LINEAR STANDARD series

Linear Standard units represent the acme from the standpoint of uniform frequency response, low wave form distortion, thorough shielding and dependability. LS units have a guaranteed response within 1db. from 20 to 20,000 cycles.

Hum balanced coil structures and multiple alloy shielding, where required, provide extremely low inductive pickup.

These are the finest high fidelity transformers in the world. 85 stock types from milliwatts to kilowatts.

#### LS-10X Shielded Input

Multiple line (50, 200, 250, 500/600, etc.) to 50,000 ohms ... multiple shielded.

#### LS-19 Plate to Two Grids

Primary 15,000 ohms.  
Secondary 95,000 ohms C.T.

#### LS-50 Plate to Line

15,000 ohms to multiple line ... +15 db. level.

#### LS-63 P.P. Plates to Voice Coil

Primary 10,000 C.T. and 6,000 C.T. suited to Williamson, M.L.F., ul-linear circuits.  
Secondary 1.2, 2.5, 5, 7.5, 10, 15, 20, 30 ohms. 20 watts.

CASE	LS-1	LS-2	LS-3
Length	3 1/4"	4-7/16"	5-13/16"
Width	2 5/8"	3 1/2"	5"
Height	3 1/4"	4-3/16"	4-11/16"
Unit Wt.	3 lbs.	7.5 lbs.	15 lbs.

### HIPERMALLOY series

This series provides virtually all the characteristics of the Linear Standard group in a more compact and lighter structure. The frequency response is within 1 db. from 30 to 20,000 cycles. Hipermalloy nickel iron cores and hum balanced core structures provide minimum distortion and low hum pickup. Input transformers, maximum level +10db. Circular terminal layout and top and bottom mounting.

#### HA-100X Shielded Input

Multiple line to 60,000 ohm grid ... tri-alloy shielding for low hum pickup.

#### HA-106 Plate to Two Grids

15,000 ohms to 135,000 ohms in two sections ... +12 db. level.

#### HA-113 Plate to Line

15,000 ohms to multiple line ... +12 db. level ... 0 DC in primary.

#### HA-133 Plate (DC) to Line

15,000 ohms to multiple line ... +15 db. level ... 8 Ma. DC in primary.

Case	H-1	H-2
Length	2 3/4"	3-9/16"
Width	1-15/16"	2-13/16"
Height	3 1/4"	3 1/2"
Unit Weight	2 lbs	5 lbs.

### ULTRA COMPACT series

UTC Ultra Compact audio units are small and light in weight, ideally suited to remote amplifier and similar compact equipment. The frequency response is within 2 db. from 30 to 20,000 cycles. Hum balanced coil structure plus high conductivity die cast case provides good inductive shielding. Maximum operating level is +7db. Top and bottom mounting as well as circular terminal layout are used in this series as well as the ones described above.

#### A-10 Line to Grid

Multiple line to 50,000 ohm grid.

#### A-18 Plate to Two Grids

15,000 ohms to 80,000 ohms, primary and secondary both split.

#### A-20 Mixing Transformer

Multiple line to multiple line for mixing mikes, lines, etc.

#### A-26 P.P. Plates to Line

30,000 ohms plate to plate, to multiple line.

A CASE  
Length ..... 1 1/2"  
Width ..... 1 1/2"  
Height ..... 2"  
Unit Weight ..... 1/2 lb.

### OUNCER series

UTC Ouncer units are ideal for portable, concealed service, and similar applications. These units are extremely compact ... fully impregnated and sealed in a drawn housing. Most items provide frequency response within 1 db. from 30 to 20,000 cycles. Maximum operating level 0 db. These units are also available in our stock P series which provide plug-in base. The O-16 is a new line to grid transformer, using two heavy gauge hipermalloy shields for high hum shielding.

#### O-1 Line to Grid

Primary 50, 200/250, 500/600 ohms to 50,000 ohm grid.

#### O-6 Plate to Two Grids

15,000 ohms to 95,000 ohms C.T.

#### O-9 Plate (DC) to Line

Primary 15,000 ohms, Secondary 50, 200/250, 500/600.

#### O-14 50: 1 Line to Grid

Primary 200 ohms, Secondary .5 megohm for mike or line to grid.

OUNCER CASE  
Diameter ..... 7/8"  
Height ..... 1-3/16"  
Unit Weight ..... 1 oz.

## All G-E Tubes get individual tests to assure maximum dependability!

**Q**UALITY-CONTROL sampling isn't enough—though G-E standards for this lead the industry. *Every* General Electric tube is checked for important operating characteristics.

Instrument dials say if the tube plate current is correct . . . if transconductance equals the prescribed value . . . if no undesirable reverse current flows in the grid . . . if there is no tube short, open circuit, or vacuum leak.

G-E tubes that pass these individual tests, must run the gauntlet of quality-control checks for over-all satisfactory performance. Are microphonics at a minimum? Does life-testing leave tube characteristics unchanged? Only if the

answers to these and many other questions are "yes" can G-E tubes be cartoned and shipped.

The tubes your G-E tube distributor sells are the best that precision manufacture, rigid inspection, and thorough testing can produce. Install them with confidence! *General Electric Co., Tube Department, Schenectady 5, New York.*

★ ★ ★

General Electric congratulates the winner of the 1954 Edison Award, Benjamin S. Hamilton, W6VFT, La Mesa, California. The judges named Mr. Hamilton as the amateur whose achievement was most noteworthy, because he provided San Diego County, California, with "an outstanding Civil Defense and disaster-emergency radio network". Recognition given to Award-winner W6VFT and to others whom the judges cited, was equally a tribute to the public-spirited efforts of radio amateurs everywhere.

# MALLORY HAM BULLETIN

## Mallory Type "K" Rheostats for 25 to 500 watts

In the course of experimental work, you occasionally run into a spot where you need a power rheostat or high-wattage voltage divider. When you do, we believe that Mallory Type "K" Vitreous Enamel Resistors will give you performance comparable to that which you have been getting from other Mallory wire-wound controls in lower wattages. This series is available in a complete range covering ratings from 25 to 500 watts.

One of the first things you will notice about the Series "K" control is its smoothly operating sliding contact, mounted snugly in its unique, spring-loaded and hinged carrier.

The firm direction of force exerted by this assembly eliminates completely the problem of "rocking" contacts which has plagued power control users for years. The specially compounded copper-graphite contact lubricates the resistance element, at the same time that it reduces the contact resistance between the two parts. A flexible pigtail connection provides a direct electrical path between the contact and the center collector mechanism.

Perhaps the most outstanding feature of this whole assembly, however, is its construction which allows the contact to be lifted from the resistance element for cleaning purposes without distorting or disturbing the applied force. Incidentally, the contact is almost as easy to replace as the brushes in a small electric motor.

The spring collector and shaft assembly is spring-

loaded to assure virtually constant electrical conductivity for the life of the control. In addition, all Series "K" controls above 25 watts are equipped with a copper-graphite buffer plate as a part of the collector assembly to reduce erosion as well as assure positive electrical contact. The shaft is centered and insulated from the electrical circuit by means of a high quality steatite bushing.

The body of each Series "K" control is formed from electrical grade porcelain and each turn of the resistance winding is uniformly wound on this form to provide an even progression of resistance change vs. shaft rotation. A non-alkaline, non-hygroscopic enamel is applied carefully to the winding, and then heated to a hard, glass-like finish for maximum protection to the vulnerable parts of the winding.

The smaller sizes, 25 through 150 watt, are equipped with conventional threaded bushings for panel mounting; sizes above 150 watt are equipped with set screws. All sizes have panel locating lugs which may be adjusted for universal mounting. Suitable knob and dial plate are supplied with each.

A brochure containing dimensional drawings of these controls, plus catalog listings, has been prepared. For your copy, write to us at Box 1558, Indianapolis 6, Indiana. Meanwhile, check with your Mallory Distributor, and take a good look at these power controls. Their construction alone will inspire confidence in their ability to operate properly for a long, long time.

**S-53A** The finest small communications receiver built and ideal where maximum performance is required in small space. Several steps better than the S-38C, but not quite up to larger S-40B. Covers Broadcast Band 540-1630 kc plus four short-wave bands covering 2.5-31 and 48-54.5 Mc.

Electrical bandspread for easy tuning. Two i-f stages. Switches for automatic noise limiter, code reception and high-low tone. Phono jack for records. Headphone tip jacks on rear and built-in PM speaker. Temp. compensated to reduce fading due to frequency shift. For 105/125 V. 50/60 cycle AC.

Brand New and very much wanted—Model **HT-30** Single Sideband AM and CW Transmitter/Exciter.

- Highly stable VFO with full 100:1 ratio gear drive system built-in, calibrated in kc.
- Stability comparable to most crystals .009%. Full band switching.
- Ample gain for 55 db microphone. Hum and noise 40 db down.

- Full 50 watt peak envelope output.
- Complete built-in metering.
- Unwanted sideband at least 40 db down. AM—CW—SSB.
- Undesired beat frequency down 60 db or more. T. V. I. suppressed.
- Stable 50 kc filter system.
- Provisions for coaxial output fitting.
- Built-in voice control circuit with bias switching for final amplifier.

# has

Model **SX-96** Selectable Sideband Receiver

- Covers Broadcast 538-1580 kc plus three S/W 1720 kc-34 Mc.
- Double conversion with selectable crystal controlled second oscillators.
- Selectable sideband reception of both sup-

- pressed carrier and full carrier transmissions. Highly selective 50 kc I. F. system.
- CW operation with AVC on. Delayed AVC.
- Calibrated bandspread—"S" meter—double superhet. Precision gear drive dial system.
- 10 tubes, 1 rectifier and voltage regulator.

# COMPLETE

**S-94 (S-95)** These two new Civic Patrol receivers are over 10 times as sensitive as previous models, great increased audio power output and built-in relay squelch system. Perfect for monitoring, police, fire, taxicab, telephone-mobile, forestry, Civil Defense. The S-94 covers 30-50 Mc and the S-95 150-173 Mc. Built-in speaker and provisions for headphones. Eight tubes plus rectifier. 105/125 V. 50/60 cycle AC/DC.

# HAM

**S-38D** Low cost unit with high priced performance over Broadcast Band 540-1650 kc plus three short-wave bands from 1650 kc-32 Mc. Electrical bandspread operates over large easy-to-read dial. Headphone tip jacks on rear and powerful built-in PM speaker. Oscillator for reception of code signals. Four tubes plus rectifier. 105/125 V. 50/60 cycle AC/DC.

# 2XP

*the new LOW COST  
PR crystal  
especially made for  
converters, experimental  
applications, etc.*

## TYPE 2XP

FUNDAMENTAL  
1600 to 12000 Kc.  
 $\pm 5$  Kc. \$3.95

3RD MODE  
12001 to 25000 Kc.  
 $\pm 10$  Kc. \$5.00

Increased demand for broad tolerance crystals (frequencies outside amateur bands) has resulted in the new, low-cost Type 2XP . . . especially created for converters, some types of receivers, experimental applications and other special uses. Now you can buy top PR quality crystals in Type 2XP for these special requirements at practically the same cost as regular amateur frequencies. ASK YOUR JOBBER FOR THE NEW 2XPs. Of course, if close tolerance is required, we recommend PR Type Z-1, our regular commercial crystal . . . but these will cost more, naturally. You will find that the inexpensive Type 2XP will fill most of your requirements, at a big saving!

## Section Communications Managers of the ARRL Communications Department

**Reports Invited.** All amateurs, especially League members, are invited to report station activities on the first of each month (for preceding month) direct to the SCM, the administrative ARRL official elected by members in each Section. Radio club reports are also desired by SCMs for inclusion in QST. **ARRL Field Organization station appointments** are available in the areas shown to qualified League members. These include ORS, OES, OPS, OO and OBS. SCMs also desire applications for SEC, EC, RM and PAM where vacancies exist. *All amateurs in the United States and Canada are invited to join the Amateur Radio Emergency Corps (ask for Form 7).*

# THE AMERICAN RADIO RELAY LEAGUE, INC.,

is a noncommercial association of radio amateurs, bonded for the promotion of interest in amateur radio communication and experimentation, for the relaying of messages by radio, for the advancement of the radio art and of the public welfare, for the representation of the radio amateur in legislative matters, and for the maintenance of fraternalism and a high standard of conduct.

It is an incorporated association without capital stock, chartered under the laws of Connecticut. Its affairs are governed by a Board of Directors, elected every two years by the general membership. The officers are elected or appointed by the Directors. The League is noncommercial and no one commercially engaged in the manufacture, sale or rental of radio apparatus is eligible to membership on its board.

"Of, by and for the amateur," it numbers within its ranks practically every worth-while amateur in the nation and has a history of glorious achievement as the standard-bearer in amateur affairs.

Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification; ownership of a transmitting station and knowledge of the code are not prerequisite, although full voting membership is granted only to licensed amateurs.

All general correspondence should be addressed to the administrative headquarters at West Hartford, Connecticut.

# "It Seems to Us..."

## FCC's 20TH ANNIVERSARY

The Federal Communications Commission last year marked its 20th anniversary of existence as the federal agency regulating all forms of radio and wire communication.

Old-timers will recall that most radio matters were administered by the Department of Commerce prior to 1927; the Radio Act of that year created a Federal Radio Commission, with duties obvious from its name. Our affairs were handled by FRC until the Communications Act of 1934 designated a Federal Communications Commission to take over radio regulation from FRC, and to have in addition responsibility for wire telephone and telegraph matters. The 1934 change had no particular effect on amateurs or on radio in general, for it was simply administration by substantially the same Commission and staff as FRC. The anniversary seems an appropriate one to look back to our regulatory status two decades ago.

The new Commission inherited from FRC (in reality, from itself!) a fairly sound set of amateur regulations — they having been completely revised, in consultation with the League, a year earlier. It was also an extremely simple text; that the one printed page of regulations existing slightly more than 20 years ago has grown to more than 10 pages of fine print today is a measure of the increasing complexity of even the amateur phase of the art.

In June, 1934, there were 46,390 amateur radio operators; today there are approximately 125,000. In those days licenses were issued in Classes C, B or A for three-year terms, a relatively new set-up from the earlier one-year licenses of the generally-comparable Temporary, First Class, and Extra First Class tickets. (Comparable, that is, except for the Temporary certificate, which like our present Novice license had a one-year nonrenewable term.) There were 32 quarterly examination points, compared with 61 at present (plus thousands more volunteer amateur examiners under our current procedures.)

The code speed was 10 w.p.m. and you had to copy the text in longhand — no printing. One year's experience was required before taking the Class A test, which license entitled

you to the delights of voice operation in 3900-4000 (that's as big as the 'phone band was) and 14,150-14,250 kc. A commercial 'phone license waived the technical exam. Flunking any exam made you wait 90 days before tackling it again — it's now 30 days. The power limit, as always, was a kw. If you used any of the bands below 14.4 Mc. you had to put a filter on your power supply, but raw a.c. was permissible above that point. It is worthy of note that we had "gone d.c." for even the lower bands only a few years earlier. You could operate mobile only above 56 Mc. (meaning, in effect, the 56-60 Mc. band), and *only* in aircraft — there was no mobile operation as we know it today. The license automatically granted portable privileges in any band, but this was also a brand new regulation; only a year earlier separate portable licenses and calls were required for such operation.

The bands were:

1715-2000 kc.  
3500-4000 kc.  
7000-7300 kc.  
14,000-14,400 kc.  
28,000-30,000 kc.  
56,000-60,000 kc.

You could also operate anywhere above 110 Mc.; no one else was using those "microwaves" in 1934. But it was pretty tough to generate any r.f. with gear then available; even to get to 56 Mc. a lot of hams were removing "lossy" bases from tubes.

For 'phone operation any amateur could use:

1800-2000 kc.  
28,000-28,500 kc.  
56,000-60,000 kc.

with the Class A boys additionally entitled to 75- and 20-meter voice. You could transmit music if you were engaged in bona fide tests of modulation gear.

In the interests of strict accuracy, we should point out that amateurs were assigned one additional band: 400,000-401,000 kc. To our knowledge no amateur ever had a QSO there. As the story goes, the band was earmarked for us, years and years ahead of any possible practical use of that territory, because that frequency was calculated (erroneously, as it turned out) as one for which the parabolic

reflector of the common electric heater could be used for beam purposes.

It should be noted that the few differences between the over-all band limits above and those we have today are largely a result of international regulatory agreements and not arbitrary rulings by the Commission; FCC has always assigned amateurs in this country practically every kilocycle permitted under international treaty. In the formation of the U. S. viewpoint toward international regulation the Commission has been an unqualified supporter of the amateur, as of course have most other Government agencies concerned. In this field during the last twenty years we recall particularly the 1936 FCC hearings, looking toward the Cairo world conference of 1938, and the 1944 hearings, looking toward the Atlantic City conference of 1947, at both of which — as in every conference since 1927 — amateur radio was practically on trial for its life. We know, with pardonable pride, that the testimony put into the records on behalf of amateur radio established pretty thoroughly our right to continued use of our frequencies because of our record of operation in the public interest, convenience and necessity. Yet many of the contributions of amateur radio are intangibles, and it is indeed a rare group of men who are possessed of sufficient wisdom and vision to weigh these against the hard and cold facts and statistics of the commercial users, and come up with the answer they have.

The progress that amateur radio has made these past twenty years could never have been made without the help and coöperation of a Federal agency, representing the established Government viewpoint toward encouragement of scientific endeavors on the part of its citizens as an advancement of the national interest and culture. To the Commission as an agency, the League extends its sincere appreciation. Equally as important, to the many individuals on the staff who have over these years worked in our interest, the League on behalf of all amateurs extends its warm thanks.

## OUR COVER

Nowadays accurate frequency checking is an important responsibility of every amateur. The secondary frequency standard shown on this month's cover is designed for just that purpose, as well as being compact and economical. It is capable of supplying 50-ke. check points throughout the communications spectrum. In addition, it can be used with high-frequency crystals for identification of the points. The unit is described in detail starting on page 14 of this issue in "Frequency Marker with 50-Kc. Intervals."

The author, Beverly Dudley, ex-9BR, is now editor of *The Technology Review* at the Massachusetts Institute of Technology. A former ARRL staff member, Mr. Dudley was an Assistant Technical Editor of *QST* just twenty-five years ago!

## WHAT BANDS AVAILABLE?

Below is a summary of the U. S. amateur bands on which operation is permitted as of February 15th. Changes will, as usual, be announced by W1AW bulletins. Figures are megacycles. A0 means an unmodulated carrier; A1 means c.w. telegraphy; A2 is m.c.w.; A3 is a.m. 'phone; A4 is facsimile; A5 is television; F1 is frequency-shift keying; n.f.m. designates narrow-band frequency- or phase-modulated radiotelephony; and f.m. means frequency modulation, 'phone (including n.f.m.) or telegraphy.

3.500-4.000	— A1
3.500-3.800	— F1
3.800-4.000	— A3 and n.f.m.
7.000-7.300	— A1
7.000-7.200	— F1
7.200-7.300	— A3 and n.f.m.
14.000-14.350	— A1
14.000-14.200	— F1
14.200-14.300	— A3 and n.f.m.
11.300-14.350	— F1
21.000-21.450	— A1
21.000-21.250	— F1
21.250-21.450	— A3 and n.f.m.
26.960-27.230	— A0, A1, A2, A3, A4, f.m.
28.000-29.700	— A1
28.500-29.700	— A3 and n.f.m.
29.000-29.700	— f.m.
50-54	— A1, A2, A3, A4, n.f.m.
51-54	— A0
52.5-54	— f.m.
144-148	A0, A1, A2, A3, A4, f.m.
220-225	
420-450 <sup>1</sup>	A0, A1, A2, A3, A4, A5, f.m.
1.215-1,300	
2,300-2,450	A0, A1, A2, A3, A4, A5, f.m., pulse
3,300-3,500	
5,650-5,925	
10,000-10,500	
21,000-22,000	
All above 30,000	

<sup>1</sup> Peak antenna power must not exceed 50 watts.

In addition, A1 and A3 on portions of 1.800-2,000, as follows:

Area	Band, kc.	Day	Night
Minn., Iowa, Mo., Ark.,	1800-1825	500	200
La. and east, including	1875-1900		
Puerto Rico and Virgin			
Ids.			
N. and S. Dak., Neb.,	1900-1925	500*	200*
Colo., N. Mex., and west,	1975-2000		
including Hawaiian Ids.,			
Texas, Okla., Kansas	1800-1825	200	75
	1875-1900		

\* Except in State of Washington where daytime power limited to 200 watts and nighttime power to 50 watts.

**Novice** licensees may use the following frequencies, transmitters to be crystal-controlled and have a maximum power input of 75 watts.

3.700-3.750	A1	21.100	21.250	A1
7.175-7.200	A1	145-147		A1, A2, A3

**Technician** licensees are permitted all amateur privileges in the bands 220 Mc. and above.

# A Compact Dual Beam for 20 and 40 Meters

## *Two-Band Operation with Simplicity*

BY L. J. JENSEN,\* WØMIQ

• WØMIQ has built a simple compact dual rotatable beam for 20 and 40 meters. After preliminary adjustments, hands can be changed instantly at the flip of a switch. The system is fed with a single coax transmission line with low s.w.r. on both bands. The boom is only 15 feet long, and the elements 24 feet, so it will fit in almost any backyard.

THE recent revival of loaded antennas has not only made it possible for the ham with a small backyard to put up a rotatable array for 20 meters, but it has also made a 40-meter parasitic beam mechanically feasible for the average ham. A logical development of this principle is the use of a single set of elements for two-band operation, simply shorting out loading coils, or portions of them, for the higher-frequency band. Element spacing is not a problem because a spacing of approximately 0.1 wavelength at 40 meters, where maximum gain occurs with the parasitic element tuned as a director, becomes 0.2 wavelength spacing at 20 meters. This spacing is close to optimum if the parasitic element is adjusted as a reflector. The loading coils can be shorted out by means of relays.

The photographs and sketches show the construction of a two-element beam covering 20 and 40 meters. The boom is 15 feet long, and the elements are 24 feet long. The array is easily turned with a TR-4 TV rotator.

Loading short elements, especially when the

elements are close-spaced, results in a high- $Q$  circuit in which the reactance will vary rapidly with a change in frequency. Thus any matching adjustment will hold over only a relatively small portion of the band. This can be alleviated to a considerable degree by using a pair of conductors for each element, and fanning them, as shown in the photographs. This, in effect, increases the size of the conductor. The curves of Fig. 1, made with a Millen s.w.r. bridge, show that with a match at the center of the 7-Mc. band, the s.w.r. does not exceed 1.75 to 1 at the ends of the band. At 14 Mc., there is the added benefit of wide spacing. These curves were made with a single matching adjustment for both bands.

The transmission line (52-ohm coax) is inductively coupled to the center loading coil. On 20 meters, the radiator element is shortened only sufficiently to permit the use of enough loading-coil inductance to provide adequate coupling to the link. Loading inductance is added to make the electrical length of the elements suitable for 7-Mc. operation. A pair of relays shorts out the 40-meter loading coils in each element when operating on 20 meters.

### *Construction*

The boom is a 15-foot section of 3-inch diameter ST-61 aluminum tubing with  $\frac{1}{16}$ -inch wall. A guy wire, connecting the ends of the boom, runs over a truss at the center of the boom to add rigidity. The boom is fastened at its center to a mounting, shown in one of the photographs, by means of two large U bolts. This mounting permits the boom to be tilted in either direction for adjustment of the loading coils merely by re-

\*20 West 9th St., Kansas City 5, Mo.

◆  
This view shows the assembly at the driven-element end of the boom. Except for the link winding and coax cable connection to it, the assembly at the parasitic end of the boom is identical. Shielded relay control wires also are run through the boom, emerging through a hole in the boom, and entering the relay box at the rear. Vertical guys are attached to the insulators at the ring-bolt in the end of the boom, and horizontal guys to the inner ends of the upper-element conductor. The metal base and angles between the boom and redwood support help to stiffen the mechanical joint. The outer braid of the coax cable is connected to the boom. Weather-proof tape is used to seal the coax cable and reduce corrosion at electrical joints.  
◆

The elements of this dual 20-40-meter beam are only 24 feet over all, and the boom is 16 feet long. The elements are fanned for broadbanding.

moving one of the hinge bolts or the other.

Similar U bolts at each end of the boom support a mounting for the antenna elements. These mountings are of redwood, 1 $\frac{1}{8}$  inches thick, 3 $\frac{3}{4}$  inches wide and 7 feet long.

Each half element is made up of two 12-foot lengths of ST-61 aluminum tubing, 1 $\frac{1}{2}$  inch in diameter with  $\frac{1}{16}$ -inch walls. At each of the inner ends, the tubing is flattened and drilled for the threaded rod of a feed-through insulator. At the outer ends of the supports, the elements are attached to similar feed-through insulators by means of clamps fashioned from sheet metal. The threaded rod of the outer feed-through insulator is made to extend about 6 inches above the top of the insulator. This extension serves as a vertical truss in bracing the elements. Also attached to this insulator with a sheet-metal strap is a 30-inch length of  $\frac{1}{2}$ -inch aluminum tubing that will serve as a horizontal truss. The ends are guyed to the vertical truss at the feed-through insulator.

The two conductors of each element are fanned out at the ends so that their tips are separated 30 inches. The spreaders are made of the same material as the elements, and are flattened at the

ends and drilled for screws that fasten them to the elements. The tips of the elements are similarly flattened and drilled, but the elements are not flattened for the short intermediate spreaders, since this would weaken the elements. The short spreaders are placed as shown in the photograph.

A system of guy wires is used to brace the elements both vertically to prevent drooping, and horizontally to reduce whip. Copper-clad stranded steel guy wire used in TV work is good material for these guys. The guy wires are insulated from the boom, but not from the elements. On each side of the boom, a guy wire runs from a strain insulator fastened to the boom, over the truss at the outer feed-through insulator, and thence to the upper bolt at the short spreader.

The horizontal guys run from the stand-off insulators at the inner ends of the elements to the horizontal truss, and thence to a bridle at the short spreader. This bridle is simply a piece of guy wire loosely spanning the spreader.

The relays that short out the 40-meter loading coils are enclosed in standard 3  $\times$  4  $\times$  5-inch aluminum boxes. The relays should be of the antenna-changeover type with good insulation and heavy-current contacts, such as the Ad-

Each element is guyed both vertically and horizontally. The vertical truss is a brass rod extending above the outer feed-through insulator. The horizontal truss is a piece of aluminum tubing attached to the same insulator with a clamp. Similar clamps anchor the element conductors to the insulator.

vance AT/2C. I was able to pick up some surplus 28-volt models at \$1.29 each,<sup>1</sup> operating them from a 100-ma. selenium-rectifier supply.

Leads to the loading coils are brought out through 1-inch ceramic feed-through insulators set in the sides of the boxes. These feed-through insulators also serve as mountings for all coils except the link coil. The latter is fastened to a piece of  $\frac{1}{4}$ -inch polystyrene sheet attached to the redwood support for the elements. The mounting screws also serve as terminals for connecting the coax line to the link. The coax line is fed through the boom to a point near the center where it leaves through a hole to an anchorage on the mast.

Fig. 1 — Curves showing s.w.r. measured on transmission line feeding the dual beam.

The loading coils shown are wound with heavy-duty aluminum clothesline, although  $\frac{1}{8}$ -inch to  $\frac{3}{16}$ -inch copper tubing, or No. 8 copper wire could be used. The 20-meter loading coil in the driven element has 8 turns  $1\frac{1}{2}$  inches in diameter, turns spaced approximately the diameter of the conductor. The link coil has 5 turns, similarly spaced, 2 inches in diameter. The 40-meter loading coils in the driven element each have 20 turns  $1\frac{1}{2}$  inches in diameter. In the parasitic element, the 20-meter coil has 11 turns, and the 40 meter coils 18 turns each, all  $1\frac{1}{2}$  inches in diameter.

After completion, the entire beam was sprayed with two coats of acrylic or plastic lacquer. All exposed electrical connections were first covered with plastic tape and then sprayed.

### Adjustment

The parasitic element should be adjusted as a reflector for 20-meter operation first, with the 40-meter loading coils shorted out and the driven element open at the center. In my case, it was made 5 per cent electrically longer than a half wave for 14.2 Mc. With a grip-dip meter coupled to the 20-meter loading coil, the resonant frequency should be adjusted to 13.5 Mc. by squeezing or spreading the turns as necessary. If this does not suffice, it may be necessary to add or subtract a turn. Then, with the shorts removed from the 40-meter loading coils, the coils should be adjusted for element resonance at 7.5

Mc. This gives an electrical length about 4 per cent shorter than a half wavelength — a proper length for operation as a director.

Attention should now be turned to the driven element. With the 40-meter loading coils shorted out, the output terminals of a 52-ohm s.w.r. bridge should be connected to the link terminals, and a suitable r.f. source fed to the bridge. Following recommended procedure,<sup>2</sup> the 20-meter loading coil should be adjusted for minimum s.w.r. Then, with the shorts removed from the 40-meter loading coils, these coils should be adjusted similarly.

The 52-ohm coax line may then be connected and a recheck of the match made by connecting the bridge to the transmitter end of the line. Adjustment should be made as close to the final elevation as possible. If the adjustment as checked with the s.w.r. bridge at the input of the line does not hold after the array has been put in place, the s.w.r. measurements will show the frequency of minimum s.w.r., and thus the direction in which the driven element should be retuned.

If greater f.-b. ratio is desired, the procedure will be the same, but it should start out with a greater electrical length (lower resonant frequency) for the reflector, and a shorter electrical length (higher resonant frequency) for the director.

In conclusion, I want to thank W0PUB whose ever-ready strong arm enabled countless experiments to be completed with success.

The tilting mount for the boom. The stub is an 8-inch piece of  $1\frac{1}{2}$ -inch pipe welded to a channel of  $\frac{1}{8}$ -inch steel. This channel is 8 inches long, 6 inches wide, and the sides are 2 inches high. The mounting plate (with U bolts in place) is of  $\frac{3}{8}$ -inch hardened aluminum, 6 inches wide and 24 inches long. The U-shaped strips attached to the mounting plate are of steel strip  $\frac{3}{8}$ -inch thick and 2 inches wide, case-hardened after processing and fitting. The pins are  $\frac{3}{8}$ -inch steel with nuts welded at one end and cotter-pin holes at the other. The boom may be tilted in either direction.

# Frequency Marker with 50-Kc. Intervals

*A Compact, Low-Cost Unit Using Surplus Crystals*

BY BEVERLY DUDLEY \*

• Here is a frequency standard built around the low-frequency FT-211A crystals, and using a multivibrator to obtain markers every 50 kc. throughout the communication spectrum. The oscillator circuit is one that will work with high-frequency crystals as well, and thus provide spot checks for identifying the 50-kc. harmonics.

A FREQUENCY MARKER providing spot frequencies at intervals of 50 kc. per second is a useful piece of measuring equipment for the radio amateur, not alone because it permits accurate determination of the amateur band limits, but because it provides means for calibrating receivers, variable-frequency oscillators and similar gear. The frequency marker described in this article provides crystal-controlled marker frequencies at 50-kc. intervals up to at least 30 Mc.

Power to operate the unit is taken from the 60-cycle line. The frequency marker contains its own power supply, consisting of a 6.3-volt 1-ampere filament transformer, and a half-wave selenium rectifier and resistance-capacitance smoothing filter comprised of  $C_1$ ,  $C_2$ , and  $R_1$ . Protection against short circuits to ground is provided by the ground coupling capacitor,  $C_{12}$ , in the output circuit.

The crystal oscillator uses a 6AK5 pentode in an electron-coupled Pierce oscillator circuit, with the screen of the pentode serving as the plate of an equivalent triode while output to the multivibrator is taken from the plate of the pentode. The frequency of oscillation can be adjusted over a small range by means of the variable capacitors  $C_3$  and  $C_4$ . Capacitor  $C_4$  is used to raise the frequency, whereas  $C_3$  lowers the frequency slightly. Both of these capacitors are mounted on a single ceramic base as a double trimmer, and each has a capacitance range of from 10 to 170  $\mu\text{f}$ . A series capacitor,  $C_5$ , was used to reduce the

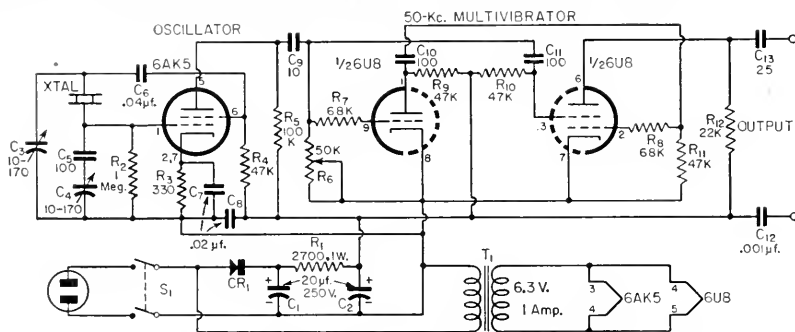

Fig. 1 — Circuit of the 50-kc. frequency marker. Resistors are  $\frac{1}{2}$ -watt composition unless otherwise specified. Capacitances in  $\mu\text{f}$ , except where specified otherwise.

$C_1$ ,  $C_2$  — Electrolytic.

$C_3$ ,  $C_4$  — Dual ceramic-mounted trimmer.

$C_5$ ,  $C_9$ ,  $C_{10}$ ,  $C_{11}$ ,  $C_{13}$  — Mica.

$C_6$ ,  $C_7$ ,  $C_8$ ,  $C_{12}$  — Ceramic or paper.

CR1 — 75-ma. selenium rectifier.

S1 — D.p.s.t. slide.

Except for the 115-volt a.c. source of power, it is entirely self-contained in a standard metal case, 3 by 4 by 5 inches in size. It uses a low-frequency crystal, such as are now readily available on the surplus market in FT-211 or FT-243 holders for two dollars or less.

## Circuit

As the wiring diagram, Fig. 1, shows, the marker comprises a 6AK5 crystal-controlled oscillator, followed by a 6U8 triode-pentode frequency-controlled multivibrator adjusted to provide marker frequencies at intervals of 50 kc. Output is ample for communication-type receivers up to 30 Mc.

maximum capacitance of  $C_4$  to about 60  $\mu\text{f}$ . Output from the plate of the 6AK5 is fed to the grid of the triode section of the 6U8 multivibrator.

The frequency divider consists of an electron-coupled multivibrator. When free running (i.e., not controlled by the crystal oscillator) its frequency range extends from about 30 to 80 kc., depending upon the setting of the frequency-adjusting resistor,  $R_6$ . When the multivibrator is frequency controlled to operate at 50 kc.,  $R_6$  has a value of about 23,000 ohms. Aside from the feature of electron coupling, which virtually eliminates effect of load on operation of the frequency marker, the only unusual feature of the multivibrator circuit is the use of series resistors in the grid circuits. These are not necessary but

\* 22 Temple Street, Belmont 78, Mass.

This unit generates frequency marker signals at 50-ke. intervals, using surplus crystals in the 400- to 500-ke. region as the primary frequency source. In this front view the oscillator tube is at the left rear and the multivibrator tube at the right.

are used as an aid in producing a reasonably good square-wave output at 50 ke.

### Adjustment

The oscillator goes into oscillation easily when the crystal is plugged into its holder. The multivibrator is, perhaps, easiest adjusted by coupling its output to a communications-type receiver and varying the resistance of  $R_6$  until marker frequencies are produced at intervals of 50 ke. This adjustment is most easily done in the broadcast band, or a similar low-frequency band of a multiband receiver. Proper adjustment is that for which the note in the receiver is sharp and clean. It will probably be found that the desired condition of operation can be obtained with  $R_6$  adjustable throughout a small range of angular rotation. If adjustment is made by means of a receiver alone, the mid-point of this angular rotation is probably the best adjustment, but a check at the high-frequency end of the receiver is advisable.

If a cathode-ray oscilloscope is available, it can be used to permit the output to be adjusted more nearly to a square wave. This is done by connecting the

output of the multivibrator to the input terminals of the vertical-input amplifier of the oscilloscope. The oscilloscope sweep circuit should be adjusted to provide horizontal sweep of from 10 to 50 ke., and the synchronizing adjustment should be advanced to lock the trace into a stationary pattern showing several cycles of waveform of the multivibrator. The resistor  $R_6$  may then be adjusted to that value of resistance which yields the most nearly square wave on the screen of the oscilloscope.

### Operating Data

Power consumption is small (approximately 10 watts) and thus the unit may be left running continuously. Very little drift — only a few cycles per second — is observed in warming up, however, so for most frequency measurements it is not really necessary to leave the unit running. The crystal frequency can be adjusted to exact value by varying  $C_3$  or  $C_4$  until the output is in zero beat with signals received from WWV.

A score of crystals have been used with this frequency marker and in all cases oscillation occurred readily. The multivibrator has synchronized easily with crystals whose fundamental frequencies were 200, 400, and 500 ke. The oscillator also worked well with crystals having frequencies of 1000 and 5000 ke., but the multivibrator would not synchronize at all with the 5-Mc. crystal, and only with difficulty and not too satisfactorily with the 1-Mc. crystal. This is in accordance with usual good practice of not using multivibrators for dividing the frequency of the

(Continued on page 120)

»

Power-supply components are at the top in this interior view of the frequency marker. Most of the oscillator and multivibrator circuit components are mounted on the Vector sockets for the two tubes.

# Overtone Crystals—How and Where To Use Them

*Some Circuits and Their Adaptation to V. H. F. Gear*

BY EDWARD P. TILTON, WIHDQ

**T**HOUGH we've used overtone crystal oscillator circuits in v.h.f. work for quite a few years, it's a safe bet that the vast majority of all hams who employ overtone techniques have little understanding of what actually goes on in such oscillators. Several types of overtone crystal circuits were discussed in detail in *QST* some years back,<sup>1</sup> and this information appears in boiled-down form in all recent editions of the *Handbook*. It is suggested that the reader go over these references, as what is to follow is supplementary to them.

All overtone oscillator circuits have one basic feature in common: some method of introducing additional feed-back, beyond that normally present in simple oscillator circuits. The difference between the various overtone circuits lies mainly in the method of controlling the feed-back. The idea is to give the crystal a little extra regenerative kick, on the frequency of the desired overtone, to encourage oscillation at that frequency rather than on the fundamental. There should be only just enough to accomplish this, without causing the stage to take off on a frequency determined by the tuned circuits, rather than by the crystal.

## How Crystals Work on Overtones

The frequency at which a quartz plate will

<sup>1</sup> Tilton, "Overtone Crystal Oscillator Circuits," *QST*, April, 1951, page 56.

Fig. 1 — How crystals oscillate at fundamental and overtone frequencies. The crystal, A, is shown at successive peaks of the cycle, when oscillating on its fundamental frequency, B and C. When oscillation is on overtones the crystal is broken down into layers, as shown at D and E.

• The economy and circuit simplicity that are achieved through the use of overtone crystal oscillators have a price: the need for some care on the part of the user, to be sure that they are adjusted and operated properly. Overtone crystals and circuits should be thought of as tools useful in attaining certain ends, rather than as an all-inclusive technique to replace other methods in v.h.f. circuit design. Here the good and bad features of overtone circuitry are sorted out, to enable the v.h.f. man to decide whether they are right for the job at hand.

oscillate is determined by the way it is cut from the main crystal, and in the case of frequencies we're interested in here, by its thickness. The crystal, Fig. 1A, is deformed mechanically during oscillation, as shown in greatly exaggerated form in Figs. 1B and 1C. When the crystal oscillates on an overtone (the fundamental frequency divided by some *odd* number) it breaks down into separate layers. There are three layers for a 3rd-overtone oscillation, five for 5th, and so on. The overtone crystal looks like Fig. 1D and 1E, again greatly exaggerated. There is no fundamental-frequency oscillation at this time, nor is it possible to develop oscillation on even multiples.

When we remember that a crystal is actually a very thin plate, we can see why some work perfectly on their design frequencies, but refuse to oscillate on overtones. And it is obvious why extreme care must be taken in grinding and mounting crystals where overtones higher than the third are to be used. A 7-Mc. BT-cut crystal is only about 0.014 inch thick. This means that the overtone layers, even for 3rd-mode operation, are less than 0.005 inch in thickness. For 5th mode they are less than 0.003 and for 7th, 0.002 inch thick! This doesn't allow much for variations in thickness due to imperfect grinding. Even a tiny scratch on the surface may destroy overtone-mode operation entirely. The slight convex curvature usually imparted to the surfaces of standard crystals also may prevent high-order overtone oscillation.

The method of mounting, too, may have considerable bearing on how well the crystal will work in overtone service. Pressure mounting, as in the FT-243 type of holder so commonly used, clamps the crystal in place and tends to inhibit overtone oscillation. In general, crystals mounted in the small CR-7 type of holder, with electrodes in the form of plated areas on the crystal surfaces, tend to work better on overtones than do pressure-mounted types. The capacitance of the holder may be an important factor in the attainment of high-order overtones, and here, again, the CR-7 holder and mounting method are superior.

Just about any crystal that will work well on its intended frequency will oscillate reasonably well on its 3rd overtone. Higher overtones are generally unsatisfactory with crystals ground for fundamental use. The 5th may be found, but with a majority of run-of-the-market crystals it will be low in output and very critical in adjustment. This applies to crystals between 5 and 12 Mc. Lower than 5 Mc., the crystals are thick enough so that 5th and sometimes higher overtones can be developed. Fifth-mode operation of 3.5-Mc. crystals, for instance, may be quite satisfactory. We keep hearing about this or that pet circuit that makes possible the development of high-order overtones with any crystal, but many hours of tedious adjustments with any number of circuit variations and with hundreds of crystals have convinced the writer that trying for overtones beyond the 3rd with crystals higher than about 5 Mc. is a waste of time and patience, unless crystals ground especially for overtone service are used.

### Overtone Circuitry

With crystals ground and mounted for overtone use, even simple circuits will work satisfactorily, provided that there is a tuned circuit at the overtone frequency, as in Fig. 2A. This is suitable for use between 12 and 54 Mc., the range over which relatively inexpensive 3rd-mode crystals are currently available. There is some overlap between 12 and 20 Mc. as to whether a crystal is an overtone type or not. Most manufacturers supply overtone crystals for any frequency above

12 Mc., though fundamental crystals can be made up to about 20 Mc.

The simplest circuit, Fig. 2A, ordinarily does not provide enough feed-back to make fundamental crystals in the 6- to 9-Mc. range take off on the 3rd overtone, however, so some provision

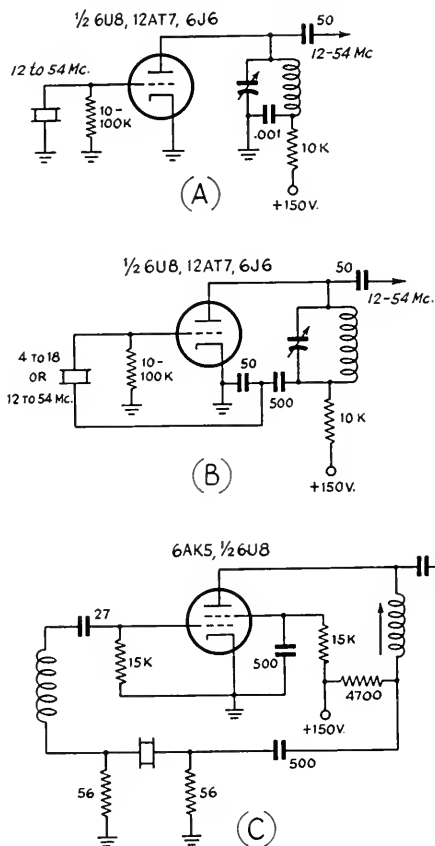

Fig. 2 — Three circuits for use with overtone crystals. Circuit A, the simplest possible overtone circuit, is suitable for use with crystals processed for overtone service. Circuit B introduces more feed-back, and may be used with fundamental-type crystals. The circuit at C is for obtaining high-order overtones with crystals that were processed for 3rd-overtone use. It was sent in by W9MBI, who reports use of it for direct control at frequencies as high as 216 Mc. In all three diagrams, the tuned circuits are resonated at the frequency of the desired overtone. The grid circuit in C may be tuned with a capacitor for greater range.

must be made to increase and control regeneration. In addition to the circuits we've been using for several years<sup>1</sup> there are variations such as the one shown in Fig. 2B. This circuit was first used in *QST* through the courtesy of the Robert Dollar Co. and W6EFT. The feed-back element here is the smaller of the two capacitors connected between the low side of the plate coil and ground. Decreasing the capacitance increases the feed-back, though the value of 50  $\mu\text{f.}$  has been satisfactory in several applications in which we've tried many types of crystals. This takes only one

# Flexibility in the Antenna Coupler

## A Wide-Range Antenna Tuner and Coax-Matching Circuit

BY T. H. PUCKETT,\* W5JXM

• Antenna couplers don't seem to have changed much over the years, but matching the coupler to a coax line is becoming increasingly important to amateurs. Here is a unit which performs both functions in one package.

THE advent of low-pass filters and pi-tank output circuits has just about made some form of transmission-line impedance matching a must in amateur stations. Also, if a balanced antenna and transmission line is used, most amateurs these days prefer to put in some

Fig. 1—Complete schematic of the coupler.  $T_1$  should be as required for series- or parallel-tuning of the particular antenna-feeder system used (Barker & Williamson type TA antenna coil used in the unit pictured).

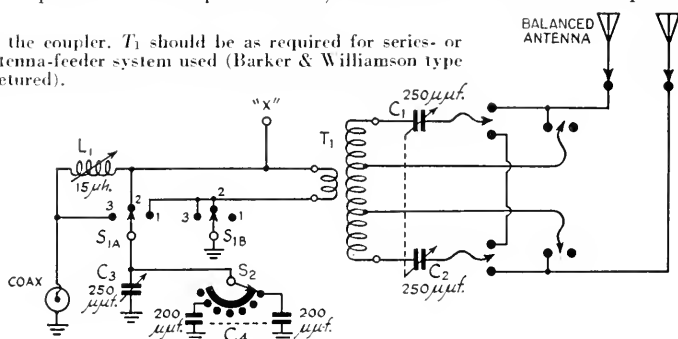

$C_1$ ,  $C_2$ —250- $\mu\text{f}$ . variable, 3000-volt rating (see text).

$C_3$ —250- $\mu\text{f}$ . variable, 1000-volt rating.

$C_4$ —Nine 200- $\mu\text{f}$ . 1250-volt working, mica condensers.

$S_1$ —2 poles, 3 positions, steatite.

$S_2$ —10-position progressive shunting (Centralab P1S section, steatite).

device to convert to unbalanced coaxial line because of its greater convenience in installation. This antenna coupler is designed to perform both of these functions in one package, and to have enough range to accommodate any of the usual amateur antenna-feedline combinations. This is achieved by using plug-in coils for bal-

anced to single-ended conversion, and an adjustable  $L$ - $C$  section for matching to the coax transmission line.

The complete circuit is given in Fig. 1. Barker and Williamson type TA plug-in coils are used for  $T_1$ , the balanced-to-single-ended converter. These are designed for this purpose, being made of tinned wire so that taps may be easily made. Two clips are furnished with each coil for making taps.

The antenna side of the circuit is a more or less conventional plug-and-jack arrangement which may be connected for either series or parallel feed. Fig. 2A shows the plug arrangement for parallel feed, and B for series feed. The taps on

the coil are not needed for series feed, but are indicated because the same coil might be used for both series and parallel feed at different times. Dummy jacks are provided for storing the taps.

The antenna tuning capacitors  $C_1$  and  $C_2$  have a maximum capacitance of 250  $\mu\text{f}$ . each, which is considerably more than is necessary to resonate the 80-meter coil. However, it is sometimes convenient to have the extra capacitance available, as some antennas couple considerable reactance into the tuner which must be canceled out to achieve resonance. As it was expected to use this coupler only on the 80-, 40- and 20-meter bands, no great thought was given to the rather large minimum capacitance of these capacitors. If regular 15- or 10-meter operation is planned it is suggested that 150- or even 100- $\mu\text{f}$ . capacitors be substituted. Also, it would probably be wise to make the circuit a little more symmetrical. As may be seen in the back view, one capacitor is much nearer the variable inductor than the other, and has an aluminum support bracket fastened to it.

The coax line side of the unit may be set to three different configurations by the circuit switch  $S_1$ . These are shown in Fig. 3. A shows the switch in position 1, where the fixed link is

\* Box 2155, Boulevard Station, Norman, Okla.

Front view of the coupler. The large center dial controls the antenna tuning capacitors through a right-angle drive. The two knobs at the lower left control the matching-section capacitance, the switch controls the matching-section circuit, and the counter dial drives the matching-section variable inductor. All controls have arbitrary letter designations.

Rear view of the coupler. The antenna feed line comes in from the top. The  $L$ - $C$  matching section components are along the bottom. The 80-meter coil is plugged in. A standard 10½-inch aluminum rack panel is used as a mounting base. The output coax connector is behind the variable inductor.

series tuned. B shows the switch in position 2, with an  $L$ - $C$  matching circuit that is useful when the impedance looking into the link is high. C, position 3, is useful when the impedance looking into the link is low.

Switch  $S_2$  is a progressively shorting ten-position switch which can connect nine 200- $\mu\text{f}$ . fixed mica capacitors,  $C_4$ , in parallel with the 250- $\mu\text{f}$ . variable capacitor,  $C_3$ . This gives a total capacitance range of about 2000  $\mu\text{f}$ . The variable inductor  $L_1$  is a 15-microhenry job, Barker and Williamson No. 3852, which is driven from the front panel by a B & W No. 3902 100-turn counter dial.

#### Operation

A standing-wave ratio bridge of some kind is an excellent indicator for adjusting the coupler.

The controls are simply manipulated to produce a null on the s.w.r. bridge. If one of the "Micro-match" type is used, it may be left in the line continuously. A calibration chart should be prepared which lists the control settings *vs.* frequency.

The suggested operation of the coupler when it is being calibrated is as follows: Set  $S_1$  on position 2, and  $C_3$ ,  $C_4$ , and  $L_1$  on minimum capacitance and inductance, respectively. Plug in the proper coil and adjust the antenna tuning capacitors,  $C_1$  and  $C_2$ , and the coil taps, if used, to give resonance. This would be indicated by a dip on a standing-wave indicator. Then adjust  $C_3$ ,  $C_4$  and  $L_1$  until the line is matched. Try the other two positions of  $S_1$  if necessary. Position 2 of  $S_1$  is preferred, as it should give the best

# Low-Noise Receiver Design

### Reworking a Receiver for Maximum Sensitivity

BY HARRY LONGERICH,\* W2GOY/4, AND ROBERT D. SMITH,\*\* W5LHD

• This is an interesting article telling how two amateurs were able to improve considerably the performance of a commercial receiver. We think you will be interested in the reasoning and the circuitry involved. However, it should be pointed out that the improvement that can be expected with any receiver will be in proportion to the poorness of its present performance and the lack of outside noise at one's location—you can't expect these changes to help a currently-good receiver or one in a noisy location.

**A**FTER spending several hundred dollars for a new receiver, most of us feel rather pleased with ourselves — if we didn't, that hollow sensation in the hip pocket would be hard to bear. But how about a few months later, when the novelty has worn off and we've settled down to some serious DX operating? Are there ever any little gnawing doubts? Probably more often than most of us would care to admit. The crux of the situation is that while one receiver may have better selectivity, stability, or operating con-

\* Major, Office of the Chief Signal Officer, Washington 25, D. C.

\*\* Lieut., 6207th AC&W, APO 74, % Postmaster, San Francisco, Calif.

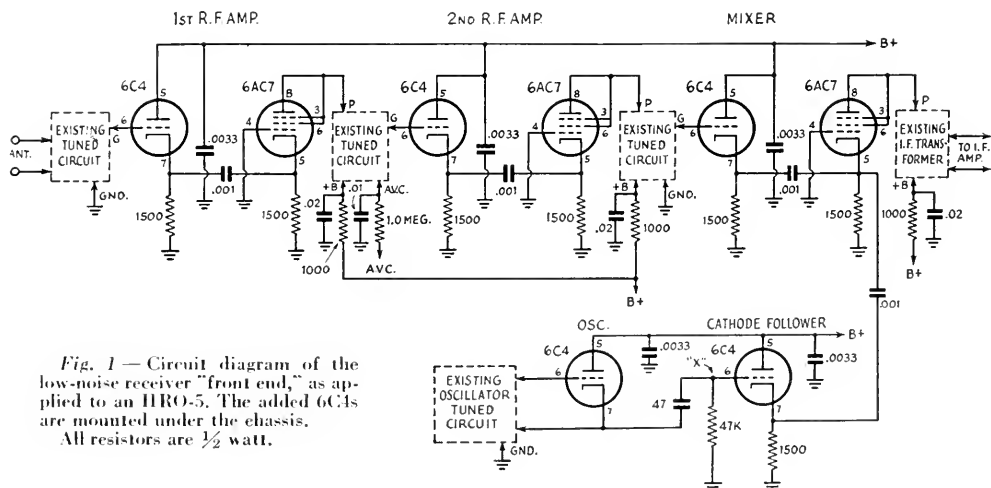

<sup>1</sup> Two r.f. stages are not necessarily better than one. If a low-noise mixer is used, one good r.f. stage should be sufficient, and it would lessen the chances of cross-modulation in the front end. — Ed.

venience than another, they are pretty much alike so far as front-end performance is concerned. This is because the industry long ago settled on pentode r.f. amplifiers and pentagrid mixers as the accepted standard. Obviously, two r.f. stages are better than one or none, but manufacturer X's r.f. amplifiers or mixers will have essentially the same noise figure as those of manufacturer Y.<sup>1</sup>

As it turns out, low-noise amplifiers have been easiest to build for the v.h.f. bands because of the small frequency coverage (percentagewise) demanded of most v.h.f. receivers. External noise is lowest in the v.h.f. bands, and hence full advantage can be taken of low-noise r.f. amplifiers. Generally accepted theory considers that external noise (static, etc.) is so strong below 25 Mc. that it is useless to use special circuits to reduce internal receiver noise on our general operating frequencies. While this is essentially true, we believe the critical frequency to be more in the order of 10 Mc., indicating low-noise circuits for three of our most important DX bands. This figure of 10 Mc. is somewhat variable, depending on local conditions; certainly the man who lives under a trolley line is little concerned with internal set noise at virtually any frequency.

### Testing Your Receiver

Here is a simple test to determine whether or not a lower noise figure would help your own receiver: set it to or near your favorite DX band (use your regular receiving antenna), tune in a frequency entirely free of any signal, advance the

*Fig. 1*—Circuit diagram of the low-noise receiver "front end," as applied to an HRO-5. The added 6C4s are mounted under the chassis.

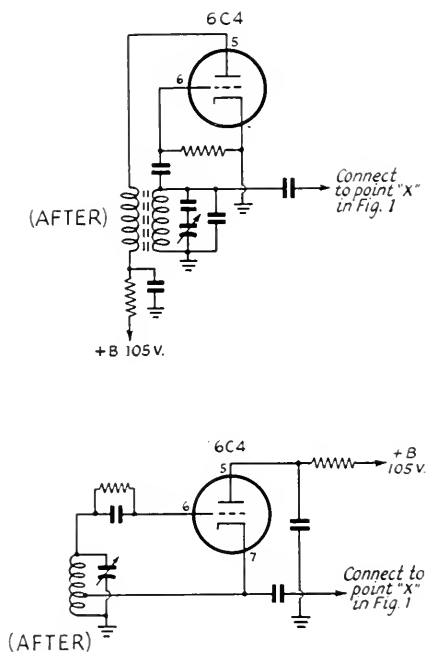

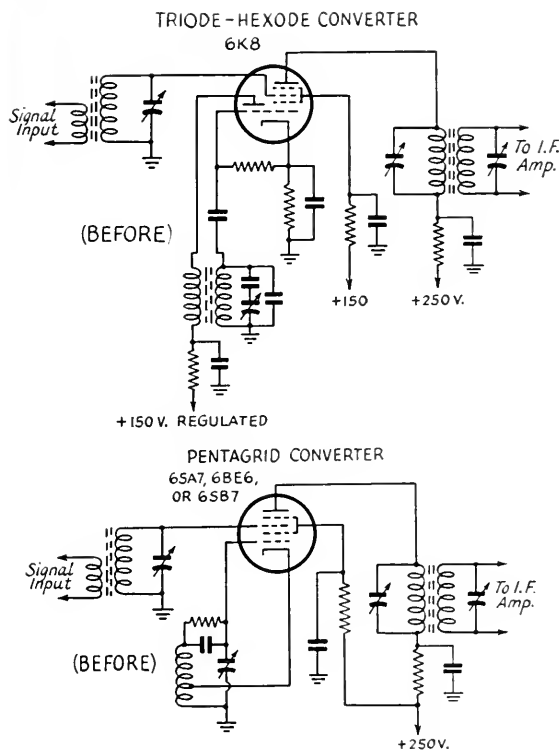

Fig. 2 — Typical oscillator circuits, before and after modification.

gain until the noise is at a comfortable level, and now substitute a resistor having the same value as the antenna input impedance, usually about 300 ohms. If there was not an appreciable decrease in noise when the antenna was replaced by the resistor, your receiver can stand improvement; most of the noise remaining is being generated within the receiver.

We made the above test on a modified HRO-5, and found that internal set noise masked much of the weak-signal DX. In the course of testing this and other receivers, another interesting fact came to light. Literature covering weak-signal reception, available to us, generally states that the first r.f. stage is the most important since its noise is amplified more than that of any other stage. This apparently does not hold true for the average amateur receiver; a considerable amount of noise is contributed by the pentagrid mixer or converter stage. Further research into the subject disclosed that pentagrid mixer and converter tubes available today have an equivalent noise resistance ranging from 62,000 to 300,000 ohms;<sup>2</sup> in addition, conversion transconductance is low. Economic factors and construction convenience have generally dictated the use of conventional mixers or converters, because they are simple and inexpensive and perform fairly satisfactorily for most medium frequency applications. However, at frequencies above 10

Mc., they may leave quite a bit to be desired.

### R. F. Amplifiers

The triode is the least noisy vacuum tube amplifier known. A check of tubes narrowed our choice to a triode-connected 6AC7, or the miniature version, the 6AH6, since they have the highest  $g_m$  and therefore the lowest equivalent noise resistance of available triodes.<sup>3</sup>

A straight triode amplifier is not practical because it will oscillate without neutralization, and neutralization is impractical in multiband receivers. The grounded-grid amplifier overcomes this objection, but in turn has the drawback of heavy input-circuit loading. To overcome this disadvantage, the cathode follower is made to order. The high input impedance of a 6C4 cathode follower stage decreases loading of the tuned circuit, resulting in greatly increased input-signal voltage, and improved r.f. selectivity; while the low output impedance of the cathode follower matches the input of the grounded-grid stage. Our experience has shown the combination to be relatively noise free.

### Mixer

Since the grounded-grid amplifier and cathode follower proved so successful, it was decided to try the combination in the mixer stage. Cathode injection looked like a good bet.<sup>4</sup> The circuit was incorporated in the modified HRO-5 and it

# The Multimatch Antenna System

Unique Design Providing Essentially Constant Impedance Over Several Bands

BY CHESTER L. BUCHANAN,\* W3DZZ

• For a long time, hams have been searching for a single antenna that could be fed efficiently with a low-impedance transmission line on several bands. At last a simple but ingenious design by W3DZZ provides a solution. He has applied some well-known but neglected principles to both wire and parasitic-beam antennas.

RADIO transmitters and receivers have enjoyed rapid development in flexibility to the point where changing bands is a matter of only spinning a dial or two and flipping a couple of switches. In contrast, the operation of a single antenna on several bands is usually done only at the expense of high standing waves on the feed line, because of the wide variation in antenna feed-point impedance from band to band.

Some work done by the author several years ago in connection with a dual-band parasitic array<sup>1</sup> has led to the development of a simple wire antenna covering five bands, from 80 to 10 meters. This antenna can be fed with a low-impedance transmission line without incurring excessive s.w.r. on any of these bands.

## Basic Design

The fundamental principle of the system can be explained with the aid of Fig. 1. In Fig. 1A,

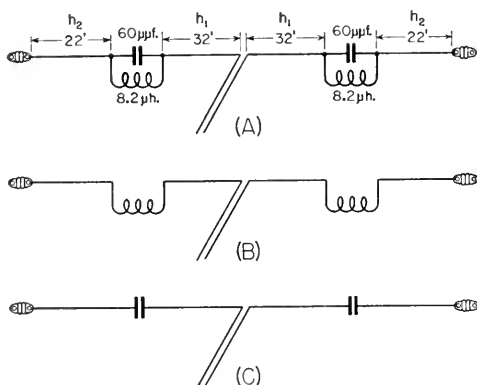

Fig. 1 — Sketch illustrating the three fundamental modes of the multimatch antenna.

\* 4671 Lacy Ave., Washington 23, D. C.

<sup>1</sup> Buchanan, "Duo-Band Ham Antenna," *Radio & Television News*, December, 1950.

<sup>2</sup> Morgan, "A Multifrequency Tuned Antenna System," *Electronics*, August, 1940.

sections  $h_1$  constitute a half-wave dipole for some frequency  $f_1$ . This dipole is terminated in lumped-constant trap circuits resonant at  $f_1$ . Additional wire sections,  $h_2$ , extend beyond the traps. If the system is excited at frequency  $f_1$ , the traps serve to isolate the dipole much as though insulators were inserted at these points.<sup>2</sup>

At frequencies much lower than  $f_1$ , the traps no longer isolate the dipole, but act simply

Fig. 2 — S.w.r. measurements made on the antenna of Fig. 1A. The dashed lines show measurements made on a 122-foot dipole in the same location for comparison.

as loading inductances in a second dipole whose electrical length is made up of  $h_1$ ,  $h_2$  and the inductive reactance of the traps, as in Fig. 1B.

At frequencies much higher than  $f_1$ , the traps again cease to isolate the sections, the traps now acting as series capacitances, as in Fig. 1C.

Another important consideration in this multi-band system is that low impedance at the center feed point of the antenna occurs not only at its fundamental resonance but also at any odd harmonic of the fundamental.

By applying these principles, and by proper selection of the values of  $L$  and  $C$  in the traps, and choice of lengths for  $h_1$  and  $h_2$ , it has been possible to arrive at a design where the system operates as follows:

- 1) Sections  $h_1$  form a half-wave dipole resonant

in the 40-meter band. The traps, resonant at the same frequency, isolate this dipole from the outer sections.

2) The inductive reactance of the traps is such that the entire system, including sections  $h_2$ , resonates as a loaded half-wave dipole for the 80-meter band.

3) The capacitive reactance of the traps at higher frequencies is such that the entire system resonates as a  $3/2$  wavelength antenna on 20,  $5/2$  wavelength on 15, and  $7/2$  wavelength on 10 meters.

The antenna is fed with 75-ohm Twin-Lead, and Fig. 2 shows the results of s.w.r. measure-

Lightweight weatherproof traps made by the author. To the left is the type inserted in beam elements, while the other one is suitable for wire antennas.

Fig. 3—Dimensions of the 3-band parasitic beam found optimum at W3DZZ. Dimensions are, of course, duplicated on the opposite side of the boom.

ments made across each band. Proper dimensions are given in Fig. 1A.

### Trap Construction

The values of  $C$  and  $L$  used in the traps are quite critical. The capacitance should first be adjusted accurately to  $60 \mu\mu\text{f.}$ , then the inductance should be trimmed until the trap resonates at 7200 kc. This should be done before the traps are inserted in the antenna. The inductance will be approximately  $8.2 \mu\text{h.}$  The traps made by the author are 6 inches long and weigh only 6 ounces and the  $Q$  is well over 100. They will withstand the voltage developed by a 1-kw. transmitter. Samples are shown in the photograph. The wire-antenna capacitor is made up of concentric lengths of 1-inch and  $3/4$ -inch aluminum tubing separated by polystyrene tubing with  $1/8$ -inch

walls, molded around the inner conductor. The polystyrene is also flowed into a series of holes in one end of the outer conductor so that the strain of the antenna will not pull the assembly apart. The inductor is wound with No. 14 wire and is concentric with the capacitor. The inductor is weatherproofed by molding it in insulating material. Other construction might be used, of course. As an example, a conventional inductor and capacitor could be enclosed in a plastic box, suspended across an insulator. This would, however, add to the weight.

### A Three-Band Parasitic Beam

The principle of isolating sections of an antenna with resonant traps has been applied to a parasitic beam antenna that operates on 10, 15 and 20 meters. This array with dimensions is sketched in Fig. 3. The array is a five-element job on 10 meters, with two reflectors spaced approximately 0.15 wavelength, and two directors spaced approximately 0.2 wavelength. On the other two bands, three elements are active. On 15 meters, spacings are approximately 0.22 wavelength for the reflector and 0.29 for the director. On 20 meters, the approximate spacings are 0.14 and 0.2, respectively.

Fig. 4 shows a breakdown of a suggested method of construction of the three main elements. Each element starts out with a 12-foot center section to which various sections are added at each end. Provision is made for adjusting the length from the center of the element to the first (28-Mc.) trap, the length between traps, and the section on the outside of the second (21-Mc.) trap. The photograph shows an example of the array traps used by the author. Here,

(Continued on page 130)

Fig. 4—Breakdown of the element assembly. Sections A and B are assembled permanently. Other sections may be telescoping for adjustment. Detail of the polystyrene inserts is at the right. The  $7/8$ -inch o.d. sections should be inserted to a depth of  $2 3/4$  inches.

# The "Hidden Gem"

## A Field-Strength Indicator for Mobiles

BY CLIFFORD ABEL,\* W8IWB

• All mobileers will find this little gadget mighty convenient and valuable. A simple field-strength indicator helps to tell you when you are getting the most out of your rig on any band.

ONE of the main problems besetting today's struggling mobileer is getting maximum power output from his installed equipment. Considering the relatively low-power input and poor antenna radiation efficiency with which he must contend, the mobile operator can ill afford the additional losses of improper antenna or transmitter tuning. After the transmitter and antenna of his choice have been installed, he must make the most of it no matter what his power input or what the inherent efficiency of his antenna system may be. What could be a better method of making the most of it than by measuring the relative strength of the radiated field as

The field-strength indicator is mounted on the inside of the glove-compartment door, oriented so that it can be seen easily from the driver's seat. The antenna banana plug is at the left rear, the sensitivity control is at the upper left, and the slug screw of the inductor at the lower right. Small holes in the top of the can provide access to the sheet-metal screws holding the unit to the glove-compartment cover.

the antenna and transmitter tuning are changed! In other words, use a field-strength indicator.

Nearly any type of field-strength meter could be used to do the job. A de luxe commercial meter borrowed from a fixed station or a simple crystal rectifier in series with the low-current scale on your volt-ohmmeter will work with a proper pick-up antenna. But most desirable is a

unit which is an integral component of the mobile system — an indicator that will give a relative power-output measurement from minute to minute, and day to day.

You may have already been convinced of the value of a mobile field-strength indicator, but then the question arises of where to put the thing. Your under-dash mounting space may be pretty well used up by now, so why not stick it in the glove compartment? In there it's completely out of the way and out of sight. Better

Fig. 1 — Circuit of the field-strength indicator.  $L_1$  and  $M_1$  are discussed in the text.  $L_1$  should be approximately 200  $\mu$ h.

yet, if you mount it on the inside top of the glove-compartment door, it will take up little of the useful space in the compartment. When the door is opened, the indicator drops down into a position where the scale can be seen easily, and the compartment light illuminates the meter for nighttime operation. Two small sheet-metal screws can be used for mounting.

### Construction

The circuit, shown in Fig. 1, is conventional, and none of the values is critical. Nearly any type of crystal detector can be used, and the meter movement can be anything from 50  $\mu$ a. to 2 ma. or more, depending upon the size and placement of the pick-up antenna and your transmitter power output. All the components are housed in a small tin can. The round can is available and cheap, and takes up less space than other types of housing. It doesn't look half bad if it's new and shiny, or if you give it a coat of black crackle paint. The can is the 8½-ounce size. That's the same diameter as a can of Campbell's soup, but somewhat shorter. Of course, the smaller the meter you can find, the smaller the can may be. The pick-up antenna lead-in comes in to a banana plug. Thus, the whole assembly can be detached quickly from the car and can be used anywhere that a field-strength indicator might be needed. By using the terminals on all the fixed-mounted components and one 3-point soldering-terminal strip, all the other components may be mounted easily and compactly.

# Transmitter Hunting – Seattle Style

## *A De Luxe D.F. System for Ten Meters*

BY J. ALAN DUNCAN,\* W7OTA

• This story on hidden-transmitter hunting should strike a response in every mobile ham. It includes, along with other useful information, descriptions of a special S-meter circuit and a direction-finding loop with suggestions for mounting.

WITH civil-defense and disaster-relief training on the steady increase throughout the nation, it becomes more and more necessary that amateur mobile stations be kept ever alert and active, so they may supply that vital communication link so important if the situation should arise. Hidden-transmitter hunting has been found to be one of the best drills for keeping the mobiles trained for this type of activity, because it develops the qualities required for successful emergency mobile communication. It also affords more thrills, more opportunity for technical development, and more participation by the whole family, than most other phases of amateur radio. The mobile operators in the radio clubs of Seattle, Washington, have been kept active on 29 Mc. almost continually since Don Newman, W7CO, first brought hidden-transmitter hunting to Seattle some five years ago.

Various methods and techniques are used to locate the hidden transmitter, depending upon the equipment on hand and the ingenuity of the hunter. Some mobileers do remarkably well with just their transmitting whips, using the directional characteristics of the car, and by determining the signal strength by ear. The author prefers a more exact method, however, and describes the following equipment and tracking technique for those mobileers who would use a more scientific approach to this exciting sport.

### *The Loop*

Essentially, a directional loop and a signal-strength meter are the required auxiliary equipment for successful hunting. The author's loop is a one-turn resonant circuit, nine inches in diameter, requiring about  $65 \mu\text{f.}$  of capacity to tune it to 29 Mc. The signal is fed from the loop to the receiver through a 50-ohm coaxial cable which is gamma-matched to the loop. Fig. 1 shows the loop dimensions and the method of coupling the coaxial cable to it. The loop diameter is not especially critical so long as it is kept small (under about 10 inches), and any discrepancy may be compensated for in the adjustment of the variable capacitor. The dimension of the coupling

tap is shown only as a starting value. Further adjustment will be required in the tuning process. For the tuning capacity the author is using a  $50\text{-}\mu\text{f.}$  fixed capacitor in parallel with a  $25\text{-}\mu\text{f.}$  variable capacitor (Hammarlund APC-25). This tuning arrangement was arrived at after some experimenting, and has been found to be very steady and extremely easy to tune. The capacitor combination is enclosed in an old surplus capacitor casing (Sangamo type F-2) with the original capacitor removed. With a new sealed-in fiber

The loop assembly mounted on W7OTA's car. The mounting is a triangular framework of tubing or rods with plates that hook over the window frame, and a rubber suction cup at the bottom. The loop mast revolves in a section of tubing. Large rubber bands to the external rear-view mirror and door handle help to hold the assembly in place.

bottom cover, this makes a nice weatherproof housing.

The type of stock used, the method of mounting the loop to the car, the dimensions of the mount, etc., will certainly vary with desire and circumstances. The author constructed his loop and mount entirely of duralumin tubing, though most hunters use copper for the loop. The style and mounting are shown in the illustration.

### *Adjustment*

Tuning the loop is a very simple process. Connect it through the coaxial cable to the an-

\* 6016 45th Ave. N.E., Seattle 5, Wash.

tenna terminal of the receiver. Radiate a 29-Mc. signal with a grid-dipper, r.f. signal generator, or some other calibrated source, and tune the loop to resonance as indicated by maximum signal. The loop should also be rotated for maximum, and then rocked back and forth across maximum as the capacitor is being adjusted. Then adjust the gamma match by moving the connection back and forth along the loop until maximum transfer is indicated. This may throw the loop off resonance, so the processes should be repeated until neither causes any noticeable improvement. The loop should be tuned very carefully, otherwise a sharp null may not be obtained. Although the maximum signal is used when tuning the loop, the minimum signal (null) is used when locating the hidden transmitter. This is because the angle of minimum is so much smaller than the angle of maximum signal.

### S-Meter

Difficulty is usually encountered in trying to tell a difference between maximum and minimum signal by ear as the hunter closes in, and a signal-strength meter becomes very desirable. A meter in the cathode circuit of one of the a.v.c.-controlled tubes was tried, but the change in deflection from maximum to minimum signal, as the hidden transmitter was approached, was as indistinguishable as by the aural method. The author finally came up with the amplifier-bridge circuit shown in Fig. 2. This system operates by sampling the a.v.c. voltage, amplifying the voltage change causing a change in the plate resistance of the 6C4 tube. This change in plate resistance upsets the balance of the bridge circuit (see equivalent circuit in Fig. 2B), causing a difference of potential to exist between points D and B. The resulting current flow through the meter causes the needle to deflect. Potentiometer  $R_1$  is a gain control and governs, to a certain extent, the amount of deflection of the meter. Potentiometer  $R_2$  is the zero adjustment used to balance the bridge. As the signal of the hidden transmitter changes in intensity, both the gain and zero controls will need adjusting. A

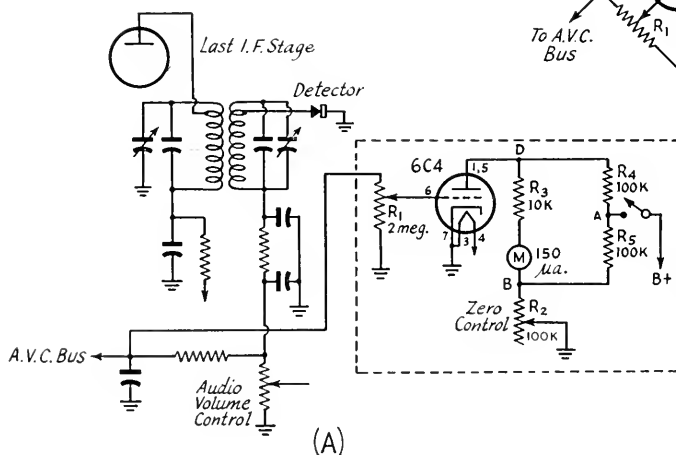

Fig. 1 — Sketch showing details of the 10-meter d.f. loop.

little technique is involved in making these adjustments during the short transmissions from the hidden transmitter, but after a couple of bunts it will be accomplished very simply. Also, the hunter will find that with a little practice, the sensitivity and gain of the amplifier-bridge S-meter can be adjusted such that full-scale

Fig. 2 — A — Schematic diagram showing the circuit of the S meter with sensitivity control and how it is connected to the receiver a.v.c. bus. B — Equivalent bridge circuit.

Close-up showing the S-meter unit mounted on the steering post.

deflection is possible (from maximum to minimum signal during rotation of the loop) regardless of whether the transmitting station is very weak and distant or whether he is within a few feet. As a matter of fact, on a particular hunt, W7CO (the hidden transmitter that night) was asked by the author at the beginning of the hunt if he was using his mobile whip or his receiving antenna for transmitting. The hidden transmitter operator replied that the hunters would have to loop in and find out. When the author arrived alongside the hidden transmitter and asked for a transmission, he was able to develop a very definite null (actually more than full-scale deflection) with the pointer directed at the rear transmitting antenna, less than four feet away.

None of the leads in this circuit need be

shielded, and the lengths are not critical. Also, don't put off making this unit just because you don't happen to have a 150- $\mu$ a. meter, as some of the boys are using 1-ma. meters with quite good results. Even the 6C4 tube may be replaced by practically any other triode tube. Half the fun is in experimenting with various values and components.

The S-meter unit may be housed in any convenient chassis or box. The author originally mounted his S-meter under the dash, next to the transmitter control unit. This was difficult to read without stopping the car, so the unit was rebuilt into a surplus pilot's control box, with the meter mounted just above in an old coil shield can. This unit was then hung on the steering column. This proved to be a very handy location. Finally a pilot lamp was installed so as to illuminate the meter and is very helpful for night hunting.

Various techniques are used to track down the hidden transmitter or "bunny" as he is referred to in Seattle. The author has used the triangulating method of pin-pointing the bunny by using a map, etc., but doesn't recommend it because it is too undependable. This is especially true in hilly country. Such phenomena as reflections, wave-polarization changes, and antenna effects will cause some readings to be in error by a considerable amount. This makes a very discouraging triangulation plot on a map, in addition to a possible waste of considerable time. The errors reduce to insignificance as the hidden transmitter is approached, however, and regardless of the system or technique used, if complete trust is placed in the loop, the hunter should eventually arrive.

#### Typical Operation

At 7:15 P.M., on the first and third Thursdays and second and fourth Fridays of the month, the Seattle mobileers (usually some ten cars) assemble in front of the museum at Volunteer Park. They proceed to tune their loops and ready themselves for the bunny hunt. At 7:30 P.M., the operator of the hidden transmitter calls, "QST, QST, QST. This is W7QPR mobile (or whatever

# Unidirectional Loops for Transmitter Hunting

*Less Guesswork in Mobile D.F. Work*

BY WARREN U. AMFAHR,\* W0WLR

**M**OBILE hams in the Wichita area have been running 10-meter hidden-transmitter hunts each week for the past three years or more. Not long after these hunts were inaugurated, it became evident that the affairs were rapidly degenerating into rat races. Under the usual rules, where the first car to arrive at the site of the transmitter was declared the winner, the honor system for compliance with existing speed limits failed completely. It became obvious that the contests would have to be conducted along different lines, if they were to be continued on a safe and sane basis. In the interest of public safety, we felt that we could not continue to encourage speedy and hazardous driving. We realized too that our call license plates and long

• This article not only describes the construction and use of a d.f. loop that eliminates much of the uncertainty in making "fixes" in fox hunts, but it also contains some interesting observations regarding the conducting of this highly popular activity.

The unidirectional 10-meter d.f. loop is a simple affair, consisting of two turns of copper tubing mounted on an insulating rod. Directivity is adjusted by the trimmer condenser at the center.

whip antennas could easily draw attention to us in any adverse publicity.

For some time now, we have been operating under a scheme in which precision and skill are substituted for speed and recklessness. The time element has been eliminated entirely, and all hunts are now based on the mileage covered

between a common starting point for all cars and the hidden transmitter. Speedometer readings are recorded at the starting point, and again when the car reaches the objective. There is no time limit, and the winner is the one who reaches the hidden-transmitter site over the shortest route.

The changes in rules naturally have brought about a search for more accurate direction-finding gear, rather than speedier cars. Perhaps the most important result has been the adoption of a unidirectional loop antenna by the hunters. It has eliminated the possibility of starting out in exactly the opposite direction, and reduced the probability of overshooting the transmitter. In eliminating the necessity for triangulation, it has simplified the hunting technique, and placed it more within the grasp of the YL and Jr. Ops.

The unidirectional loop antenna works on rather well-known principles. In simple terms, a loop that is not accurately balanced in respect to ground will exhibit two modes of operation. One mode is that of a true loop, while the other is that of an essentially nondirectional vertical antenna of small dimensions. The voltages introduced by the two modes are out of phase, and will add or subtract, depending upon the direction from which the wave is arriving.

The theoretical true loop pattern is illustrated in Fig. 1A. When the voltage introduced by the antenna mode is large, the nondirectional pattern of the vertical-antenna mode predominates, and the loop will show little directivity, as shown in Fig. 1B. When the antenna effect is small, one of the loop lobes will be reduced, while the other will be correspondingly enlarged (see Fig. 1C). When the voltages introduced by the two modes are equal and 90 degrees out of phase, one of the lobes will be canceled out, making the loop unidirectional, as indicated in the pattern of Fig. 1D.

Since the loop pick-up will usually be predominant, when the dimensions of the loop are small in terms of wavelength, the loop and antenna effects can be balanced by detuning the

\*3096 Clifton, Wichita 10, Kansas.

loop so as to reduce its pick-up to equal that introduced by the antenna effect.

The loop shown in the photograph consists of two turns of  $\frac{1}{4}$ -inch copper tubing, 11 inches in diameter. The two ends are flattened out,

Fig. 1—Small-loop field patterns with varying amounts of "antenna" effect. The heavy lines show the plane of the loop.

and fastened to opposite sides of a 1-inch diameter insulating rod that serves as a mounting. The center of the loop is broken, and a 20- $\mu$ f. mica trimmer is inserted in series. The ends of the tubing at the break are supported in a slot cut in the end of the insulating rod. The rod of the loop shown in the photograph is a piece of 1-inch polystyrene. However, a piece of ordinary broomstick will provide adequate insulation.

The loop is connected to the receiver input with a length of coax cable. After the receiver has been tuned to the desired operating frequency, the trimmer condenser in the loop should be adjusted for maximum background noise. If no peak in noise can be found, the condenser range value should be changed. An 11-inch loop should require no more than 5 to 15  $\mu$ f.

Once a noise peak has been established, a signal and the receiver S-meter should be employed. (If the mobile receiver is not equipped with an S-meter, the circuit of Fig. 2 can be

Fig. 2—S-meter circuit widely used in transmitter hunting.

added.) The capacity of the loop condenser should then be carefully reduced until the loop acquires a unidirectional characteristic. The final setting of the trimmer condenser depends upon the front-to-back ratio desired. Complete cancellation of signals from the back can be ac-

quired at the expense of a certain amount of frontal signal pick-up.

This type of loop is, of course, oriented for maximum signal in contrast to a conventional d.f. loop which is usually worked on the signal null. In the use of the loop, it will be found that resonant antennas or other objects are highly capable of receiving signal energy and reradiating it. The possibility of the loop receiving reflected signals from the mobile whip should be thoroughly investigated. Usually, the loop when used on one side of the car will be more susceptible to whip reflections than it will be on the other. This depends upon the car body contour and the distance between the loop and the whip. In some installations, it may be necessary to pull the whip down while taking loop bearings.

In the process of hunting, it is advantageous to keep the hidden transmitter on the loop side of the car. The maximum-to-minimum signal, and the exact direction, will be less pronounced if the loop has to look across a reflecting or diffusing car roof. Whenever the loop is used in the vicinity of a strong signal, some means of attenuating the antenna circuit should be used, rather than to decrease the S-meter sensitivity. Various resistor values, switched in parallel with the antenna input, will achieve this.

Those who organize, or participate in, this popular activity will find that many headaches will be avoided if the rules place strong restriction against hunting or hiding on private property. We have also found it highly advisable to notify the local police in advance of a scheduled hunt. Summer-night hunts, with dozens of dangling loops and seeking searchlights, can load the police telephone circuits with curious inquiries!

## Strays

W5UNP, enjoying a late-afternoon 75-meter QSO while parked and waiting for his NYL to QRT work at WBAP-TV, was confronted by one of the station engineers: "You're 50 per cent station level on the program monitor in master control!" the ex-ham engineer exclaimed.

You just can't get away from 'em!

# Meet the S.W.R. Bridge

## Simple Instrument for Adjusting Antenna Circuits

BY LEWIS G. McCOY, W1ICP

• Here is a nontechnical description of how to build and use a standing-wave-ratio bridge, an inexpensive instrument that is worth many times the small outlay for its construction. The use of such a bridge will help you to solve some antenna-circuit problems that can be solved in no other way.

**D**ID you ever stop to wonder if your transmitter was properly coupled and matched into the antenna or antenna coupler? If you're the average ham, this problem has probably bothered you a great deal. Well, there is one simple way to find out, and it won't cost you more than a few dollars.

When working with antennas and antenna couplers, the standing-wave-ratio bridge is practically an indispensable instrument. With the s.w.r. bridge, it is possible to know when the coax line between the transmitter and antenna coupler is matched, or if a coax-fed antenna is properly matched to the feed line. When a low-

pass filter is used to attenuate harmonics, it is important to keep the s.w.r. low in the connecting line, otherwise there is always the possibility that the filter may break down. By setting the system up with the s.w.r. bridge, one can be sure the filter will be working in a line with a low s.w.r. It has been mentioned that the s.w.r. bridge only costs a couple of dollars; another attraction is that the unit is very easy to build.

### S.W.R. Bridge Construction

As can be seen from Fig. 1 and the photographs, the bridge consists of four resistors, two

Fig. 1 — Circuit diagram of the s.w.r. bridge. All resistors are  $\frac{1}{2}$  watt, composition type,  $\pm 10$  per cent tolerance.

Top view of the bridge. Be sure to mark the input and output connectors to avoid mistakes when using the unit. The lug at the bottom end of the case offers a clip-on point for the minus side of the meter.

condensers, a crystal diode, an isolantite stand-off, two coax connectors and a chassis. A tip jack is used for the + meter terminal, and the chassis case for the - side. The value of  $R_1$  will depend on the type of coax the bridge is designed for. If for 52-ohm line, then  $R_1$  would be a 50-ohm resistor, and the value would be 75 ohms if 72-ohm coax is used. Whichever type is used, buy two resistors, because one will be used in the bridge and the other for testing the unit. All of the resistors are  $\frac{1}{2}$  watt, and be sure they are composition-type and not wire-wound.

In the construction of the bridge, the resistors and the crystal should be mounted at right angles to each other, as shown in the photograph. This is done to avoid stray coupling that might give erroneous readings. The unit shown in the photographs was built in a  $4 \times 2 \times 1\frac{1}{2}$ -inch channel-lock box. If this size is used, it should be simple to follow the layout in the photograph.

When soldering the leads of the crystal diode, the leads should be held by a pair of pliers in order to conduct the heat away from the crystal. Don't hold the iron to the soldering point any longer than necessary, as it is easy to damage the crystal with excessive heat.

### Testing

The completed unit is connected to the transmitter with a piece of coax of the proper impe-

dance, the coax going to the input side of the bridge. A 0-1 millimeter is connected to the bridge with the + side of the meter going to the pin jack and the - side to the chassis. The output side of the bridge is left open.

The next step is to adjust the transmitter output so that a full-scale reading is obtained on the 0-1 meter. A very small amount of r.f. is needed for this, so it may be necessary to turn off the final amplifier and just allow the driver stage to run. If the transmitter has a drive control, such as the Viking and Viking Ranger, it is merely a matter of advancing the drive control to a point where full-scale reading is obtained. With the meter reading full scale, the test resistor is connected between the output coax connector's inner conductor and the shell or ground side of the connector. The reading on the meter should drop to, or near, zero. If the reading is appreciably above zero, there is stray coupling between the resistor arms in the bridge, and their placement should be carefully checked and changed if necessary.

Several different resistors of the same value were tried in testing the unit shown, and in every case the reading dropped to zero, indicating that the 10 per cent tolerances were close enough for the purpose.

### Using the S.W.R. Bridge

For an example of using the bridge, let's assume we have an antenna fed with open-wire line, and that an antenna coupler is used with

the open-wire line. A length of coaxial line connects the transmitter to the coupler. Such a system is illustrated in Fig. 2A. Our problem is to

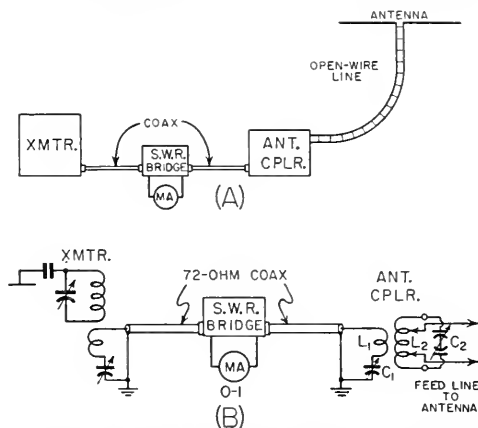

Fig. 2 — At A we see the typical layout described in the text. At B the schematic shows the actual connections one would make for using the bridge.

take the power out of the final amplifier and get it to the antenna coupler, with as little loss on the way as possible.

The Novice will probably wonder why an antenna coupler is used instead of connecting the open-wire line directly to the output terminals of the transmitter. The feeders could be connected directly to the transmitter, but it greatly simplifies coupling problems to use an external antenna coupler, particularly if the antenna is to be operated on more than one band.

Where most amateurs run into trouble with a system such as this is in adjusting the coupler and getting the transmitter to load. With an s.w.r. bridge inserted in the coax line between the rig and the coupler, it becomes an easy job to adjust the coupler to the proper operating values. An ideal set-up, for adjusting the coupler, and the link at the coupler, is shown at Fig. 2B. This coupler, incidentally, is the unit described at Fig. 13-32 in the 1953, '54, and '55 editions of *The Radio Amateur's Handbook*. Complete details are given for component values.

The bridge of Fig. 1 does not make actual s.w.r. measurements — this takes a more complicated bridge — but it shows when the s.w.r. is a minimum and as such is used to adjust the coupling system for a good match.

The first step is to set the meter to full-scale reading with the output side of the bridge disconnected. Once full-scale reading is set on the meter, the transmitter controls are not touched again for the test unless the frequency is changed. The coax line from the antenna coupler link is then attached to the output side of the bridge. The feed-line taps are attached to  $L_2$  at or near the outside turns of the coil, making sure they are equidistant from the coil ends. The coupler capacitor  $C_2$  is then tuned for minimum reading on the milliammeter. When this point is reached,

(Continued on page 138)

Inside view of the s.w.r. bridge. The resistor connected between the inner conductor pins of the coax sockets is  $R_1$ . One of the 47-ohm resistors is on the right, connected between the inner conductor pin and the junction of a 0.001-uf. disk condenser and the other 47-ohm resistor. Note the three resistors are mounted at right angles to each other. The 1000-ohm resistor at the lower left is connected between the tie point and the meter terminal.

# • On the TVI Front

## ADJUSTING LOW-PASS FILTERS

To adjust a low-pass filter for maximum attenuation of harmonics falling in a particular TV channel, it is often necessary to unsolder the coils used in the low-pass and adjust their inductance using a grid-dip meter. A short-cut that possibly provides more accurate tuning is to insert the filter into the TV receiver antenna feed line and tune for maximum attenuation of the TV picture on the critical channel. This method may be criticized by those who take a dim view of the mismatch created by inserting a 52- or 75-ohm low-pass in a 300 ohm line—but it works!

— *Kenneth Montgomery, W5ABY*

## MORE ON SIGNAL SHIFTER TVI SUPPRESSION

Some months ago a method was shown for reducing harmonic radiation from the Meissner Signal Shifter.<sup>1</sup> It was tried and found inadequate in suppressing harmonics which interfered with Channels 2 and 4 at this location.

It was found that quite a bit of r.f. was being picked up by five 115-volt a.c. leads which go to the rear of the chassis from the switch on the front panel. These were inserted separately in shielded copper braid grounded in the center and at both ends. This reduced r.f. in the a.c. line about 50 per cent.

Further inspection revealed that the output link coils in the turret are closely coupled to the plate inductances of the 807 stage. It was reasoned that if the output coils were tuned, the harmonics should be considerably reduced. An external assembly mounted in a small aluminum box (Fig. 1) was used to accomplish this objective.

Fig. 1—Schematic of external assembly for additional TVI suppression in the Meissner Signal Shifter.

- C<sub>1</sub> — 75-μμf, variable (low-loss).
- L<sub>1</sub> — Output coil of Signal Shifter.
- L<sub>2</sub> — 10 turns No. 18 plastic insulated on 1-inch steatic form tapped as follows: 3.5 Mc. — whole coil; 7.0 Mc. — 8 turns; 14.0 Mc. — 6 turns; 21.0 Mc. — 4 turns; 28 Mc. — 2 turns.
- S<sub>1</sub> — 5-position s.p. ceramic rotary.

The completed unit was fastened to the rear of the Signal Shifter. This unit consists of a tapped coil in series with the output coil of the VFO through a 6-inch length of 72-ohm coax. In addition, a 75-μμf. variable capacitor was connected from the output side of the tapped coil to ground. Another 72-ohm coax line was used to connect the external assembly to the untuned grid of an 813 final.

<sup>1</sup> McCoy, "Suppressing TVI in the Meissner Signal Shifter," *QST*, Oct., 1953.

Measurements showed that harmonic radiation was almost completely eliminated, and as further proof, the interference in the TV set disappeared.

— *M. J. Grainger, KP4JE*

## TVI COMPLAINT

2160 N. Mason Ave.  
Chicago, Ill.

Editor, *QST*:

On Friday, January 21, 1955, I received rather unique publicity in one of Chicago's newspapers about a case of TVI that came to me via the Presidential office in Washington, D. C. Apparently some of the other news services picked up this "scoop," adding or subtracting their own twist, resulting in nation-wide radio and newspaper publicity. I received considerable mail about this matter and believe an explanation is in order.

The transmitter in use here is a Viking II, equipped with a low-pass filter. My operation is on the 40-meter 'phone band, and I have no interference on TV receivers in my own home. Extensive checks have been made with several neighbors and no TVI was encountered.

After becoming aware of this much publicized case of TVI, through the local FCC office, I had my son, who is a TV engineer and also a radio amateur, conduct an investigation. The complainant's TV receiver is one of a well-known manufacturer, about six years old. Both the audio and video on all channels (2, 5, 7, and 9) were being affected in the same manner. My son installed a high-pass filter.

Tests were conducted which proved that the cause of this TVI was definitely the TV receiver. The complainant promised to contact the manufacturer and have them install a high-pass filter.

I am writing this in the hope that it may clarify the amateurs' side of the story. — *Anthony Shragal, W9SEF*

... With the Wouff-Hong in his right hand, and typing with his left, the editor proceeds to lambaste those careless operators who have been found in large numbers outside the bands, clobbering AT&T and USN circuits.

... Continuing the theme of the editorial, the first technical article deals with a description of an extremely accurate frequency standard, written by J. K. Clapp and John D. Crawford.

... "The Old Connecticut Yankee" passes out some timely advice on "coöperating with the BCL," in his usual helpful fashion.

... How to build—and how not to build—a 20-meter 'phone transmitter is discussed by Beverly Dudley, with full plans for a particular rig, using push-pull UX-210s in the final, modulated by parallel UX-250s.

... Clark C. Rodimon explores the use of electrolytic condensers in transmitter high-voltage power supplies.

... The Old Man announces he's back on the scene, complete with Rettysmith, Wouff-Hong and the pot of boiling transformer oil to get the Young Squirts back on the straight-and-narrow.

... George E. Fleming describes a high-gain direct-coupled power amplifier for audio frequencies, with comment on the relative merits of transformer, condenser and direct coupling.

... Some constructional hints are described by George Grammer, including the use of old tube bases as coil forms, shielding, winding copper tubing, and insulating shafts from metal panels.

... Station W9BVII is featured as the station of the month, and with good reason. The three-tube exciter unit is laid out in a unique circular form, and both exciter and driver are shielded. The final is a UX-852 running about 450 watts input.

# A Mobile S.S.B. Receiver for 80 and 40

## Using a Tunable I.F. and Crystal-Converter

BY ROBERT A. THOMASON,\* W4SUD

• Here is some sound reasoning on what should go into a good receiver for mobile work, and some suggestions on how to work over a BC-453-A to meet those requirements. If you have a BC-453-A that is now gathering dust, this is your meat.

WHAT FEATURES would an ideal amateur mobile receiver have for a.m., c.w., and s.s.b. reception? While everyone might not agree across the board, the writer believes they should include:

- 1) Exceptional frequency stability (for s.s.b.).
- 2) Good selectivity ( $2\frac{1}{2}$  kc. at 6 db. down).
- 3) Adequate sensitivity.
- 4) Plenty of bandwidth.
- 5) Good calibration (reset within 2 kc.).
- 6) Built-in automatic noise limiter.
- 7) Automatic volume control.
- 8) Stable b.f.o. (with switch control).
- 9) Separate a.f. and r.f. gain controls.
- 10) Independence of b.e. receiver.
- 11) Low image response.

Wait a second! That's a lot of receiver. You've got to make it fit somewhere in the family jalopy and operate it from an average car battery. Well, then, let's make the next two features:

- 12) Compactness (under-dash mounting).
- 13) Reasonable power consumption (100 ma. at 250 volts).

Assuming these specifications could be met, who could afford it? Also, the average amateur does not have the "know-how" or test equipment to build it. So we have:

- 14) Moderate cost.
- 15) Simple construction.

This receiver was realized in the writer's mobile station by converting a BC-453-A low-frequency (190-550 kc.) Command receiver.

At this point, the one drawback this receiver does have should be mentioned: Limited frequency coverage (3.5 and 7 Mc.).

This is rather serious for many mobile enthusiasts. However, by adding a high-frequency converter with output on 40 or 80 meters, the higher frequencies can also be covered with the possible partial loss of stability, bandwidth, and calibration, depending upon the quality of the converter.

### Changes & Additions

The following additions and modifications were performed on the BC-453-A to obtain our almost-super mobile receiver:

- 1) Add a crystal-controlled pentagrid converter (6BE6). This is mounted on the rear apron of the receiver originally occupied by the dynamotor. The Command receiver is used

as a tunable i.f. amplifier from 190 to 550 kc. A different crystal is used for each 360 kc. covered. The crystal switch could include a crystal for WWV or perhaps a local broadcast frequency.

- 2) Add one stage of audio amplification (6C4) between the second detector and power amplifier. The stage is mounted on a small subchassis underneath the receiver.

- 3) Add a.v.c.

- 4) Add shunt noise limiter (1N34).

- 5) Add a.f. and r.f. gain controls.

- 6) Replace all 12-volt tubes with their 6-volt equivalents. The 12A6 was replaced by a 6V6.

- 7) Rewire all heaters in parallel.

- 8) Replace the antenna trimmer capacitor with a unit that is screwdriver-adjusted from the side. The capacitor thus released was used as a b.f.o. pitch control.

- 9) Add speaker and matching transformer.

### Details

Let's take each feature and study how it can be accomplished.

The frequency stability is exceptional in this unit. The crystal-controlled high-frequency oscillator, together with the excellent stability found in these receivers, makes s.s.b. reception easily possible even while driving over rough roads.

The BC-453-A has an intermediate frequency of 85 kc. and has six tuned i.f. circuits. This gives good selectivity. The selectivity with minimum coupling in each i.f. transformer is just sharp

A BC-453-A with a few revisions makes a good tunable i.f. amplifier for a mobile receiver. One is shown here tucked under the dash.

\* 1825 Cherokee Drive, Owensboro, Ky.

For those who do not own a BC-453-A, remember that although the price is considerably higher than a few years back, they are still well worth their money. Even at today's prices, this modified receiver costs less than the cheapest commercial converter.

The modifications are simple and require a minimum of test equipment. The average amateur should have no difficulty in this respect.

The 6BE6 crystal converter is built into a homemade metal box that just fills the space on the rear apron of the receiver. The simplicity of the circuit can be seen in Fig. 1. The only caution the builder should observe is to keep  $L_1$  and the r.f. chokes well separated. The controls,  $C_1$  and  $S_1$ , are mounted on the rear of the metal box. The side may be more convenient if space is available in the reader's car. However, it is only necessary to adjust them when changing bands, so the rear mounting is satisfactory.

The regular antenna post was removed and the hole plugged. A wire was soldered to the small mica condenser that was originally tied to the antenna post and then run along the inside top of the cabinet to the converter in the rear. This will minimize stray pick-up on the i.f. intermediate frequency. It is necessary to remove the top cover and variable-condenser cover in order to reach the antenna post. While these covers are removed, small holes can be drilled for the wire going to the converter. The heater choke mounted just below the dynamotor plug underneath the chassis was removed and discarded. This gave more working room. The wires going to the dynamotor plug were left as originally connected. The heater, B+, and ground leads were thus convenient to the converter by soldering to the banana plugs.

The socket on the rear of the receiver was removed and the hole enlarged to  $1\frac{1}{16}$  inches. This permitted the installation of a conventional octal tube socket. Plugs for these sockets are made by Amphenol and are available at most distributors. The only wires retained on this plug were ground, heater, B+, and audio output. The others were cut loose at their source and removed.

The wires and neon lamp were removed from the antenna trimmer condenser; then the stator plates were connected to Pin 6 of the 6SQ7 (formerly a 12SQ7). The antenna trimmer thus became a b.f.o. pitch control. A 30- $\mu$ fd. compression condenser was mounted on the side of the chassis to serve as a screwdriver-adjustable antenna trimmer. There is sufficient gain in the receiver for this antenna trimmer to be omitted entirely, if desired.

The small metal box and condenser mounted on the front panel should now be removed to make room for the audio and r.f. gain controls, b.f.o., a.v.c., and a.n.l. on-off switches. This makes things quite crowded, and miniature components should be purchased for use here. All the wiring going to the small metal box should be cut at its source and removed, except the green and red wires; these are r.f. gain and b.f.o.

"off," respectively. The r.f. gain control is a 20,000-ohm unit, and is connected to a switch that grounds it to turn the b.f.o. on. The wiring for the other controls is shown in Fig. 2.

The output transformer used in the original set was retained and a 2000-ohms-to-voice-coil transformer mounted at the speaker. This made

Under chassis view of the reworked BC-453-A. The metal strip running across the chassis at about the center is used to support the 6C4 socket.

a little less modification work than replacing the output transformer. Also, it made 2000 ohms output impedance available for headphones.

If the receiver is used for s.s.b. reception, for the sake of stability it would be more desirable to mute the receiver at the speaker rather than to remove B+ during transmitting periods. This is not a necessity even for s.s.b. reception, if the builder wishes to use his receiver supply for a portion of the transmitter.

# Hints and Kinks

## For the Experimenter

### THREE-WAY SWITCH FOR THE SIMPLEST MODULATOR

OPERATORS who employ the "Simplest Modulator" for casual 'phone operation with their existing c.w. rigs must remember to unplug the modulator whenever the mode of operation is changed from 'phone to c.w. Of course, if the cathode of the final is keyed and if the modulator output terminals are connected in parallel with those of the key, the unplugging motion is unnecessary. However, in installations where the oscillator or a low-level stage is keyed, it is necessary to disconnect the modulator so that the r.f. output tube may work at normal input.

The circuit shown in Fig. 1 shows how a single-pole three-position switch has been put to use

Fig. 1—Circuit diagram of the switching system described by W3PVY.

with the transmitter and modulator used here at W3PVY. Two of the switch positions provide for rapid change over from 'phone to c.w. operation, and the center or third contact allows the final to be disabled during zero-bearing or tuning adjustments.

To clarify the circuit of Fig. 1, it should be mentioned that all components other than  $S_1$  are parts of the modulator circuit appearing on page 15 of September, 1953, *QST*, and page 250 of the ARRL *Handbook*, 31st edition.

—Ed Rittenhouse, W3PVY

### CONVERTING FILAMENT TRANSFORMERS FOR PLATE-SUPPLY USE

IN searching for miniature power transformers for such low-power items as grid-dip oscillators, etc., I have found it convenient to make my own, using small filament transformers. Since most of these have the low-voltage winding wound on the outside, it is a easy to remove the few filament turns to make room for the rewinding.

The procedure is simple. Count the turns removed to determine the turns per volt ratio for the core. Now rewind the filament turns with a smaller size wire. Follow this with the "high-voltage" winding using the number of turns per volt previously determined. The wire sizes should be chosen so the  $I^2R$  losses in the two secondaries

under load do not exceed the rated  $I^2R$  loss for the removed turns. This allowable loss is fairly flexible and can be exceeded by 50 per cent or so for intermittent duty or where some ventilation is present.

—Ben Vester, W3TLN

[EDITOR'S NOTE: Additional data pertaining to the re-winding of transformers will be found in Chapter 7 of *The Radio Amateur's Handbook*.]

### IMPROVED AUDIO CIRCUIT FOR THE 50-MC. C.D. UNIT

ALTHOUGH the circuit to be presented is intended primarily for use with the 50-Mc. unit described in May, 1952, *QST*, it deserves consideration by anyone embarked on a speech-amplifier project designed with carbon-microphone input in mind.

The new circuit, shown in Fig. 2, uses a 6U8 triode-pentode as a replacement for the 12AT7 originally employed in the microphone input and the amplifier-clipper stages of the c.d. unit. Not only does the revised arrangement retain all of the desirable features discussed in the original constructional article, but it increases the gain of the speech amplifier by 10 db. or more. This represents an improvement over the 12AT7 line-up and eliminates the need for crowding the microphone so that full modulation may be obtained.

Fig. 2—Schematic diagram of the revised audio circuit for W1CTW's 50-Mc. c.d. unit.

In Fig. 2, the pentode section of the 6U8 is used as the microphone coupling tube and the triode section is employed as the voltage amplifier and clipper. The schematic shows that a 0.1-megohm screen dropping resistor and a 0.1- $\mu$ f. screen-to-cathode capacitor have been added to the circuit and that the plate resistor for the input stage has been increased to 33,000 ohms. It should be pointed out at this time that the values of the plate and the screen resistors are quite critical from the standpoint of maximum obtainable gain. Further study of Fig. 2 shows that the component values and the wiring origi-

# You Can't Beat F.M.!

## Advantages of "Almost-N.F.M." for V.H.F., with Practical Application in a 48-54 Mc. Exciter

BY DON H. GROSS,\* W3QVC

SOME of the brethren may think me a bit daft for saying so, but for v.h.f. voice work nothing excels the right kind of f.m. Perhaps a few hardy souls will want to venture through the technical difficulties of single sideband on frequencies above 50 Mc., but aside from such a remarkable feat, a.m. is definitely inferior to f.m., if the latter is properly used. Go ahead and laugh, but please read on.

The word has gotten around pretty well that f.m. eliminates high-powered modulators, and that it is far better than a.m. when it comes to TVI or BCI. We can also see that the high grid drive and higher plate dissipation and voltage ratings necessary for a.m. make it difficult when we approach the u.h.f. region. Then, too, a 100 per cent modulated a.m. transmitter in the 420-Mc. band is limited to 12.5 watts antenna power (since 50 watts *peak* is the law), while up to 50 watts antenna power is legal with f.m. But we usually see a tendency to be apologetic about the communications value of f.m. This is mainly because most of our thinking since the war has been in terms of strictly narrow-band f.m., where second-order sidebands are kept insignificant so that our signals will occupy no wider channels than a.m.

In order to keep to true n.f.m., the modulation index must not exceed 0.6. Under these conditions, as the venerable *Handbook* says, "so far as effectiveness is concerned, a narrow-band f.m. or p.m. transmitter is about equivalent to a 100 per cent modulated a.m. transmitter operating at one-fourth the carrier power." At this rate, n.f.m. is enough to discourage any self-respecting DX man. Add to this the horrible method of detecting f.m. signals by slight detuning on an a.m. receiver, as nefariously practiced by most of us, and anyone with a brain in his head would conclude that if you want a signal without any vitamins, if you want your voice drowned in a waterfall of noise and clobbered with QRM, just use f.m.

### Whoa There!

However, dear friends, we have been overlooking a juicy item. Above 52.5 Mc. (and on some frequencies below) we aren't confined to the narrow-band version of f.m. What if we crank the audio gain up to give us a modulation

index of 1.0? Second-order sidebands appear, but they are still relatively weak.<sup>1</sup> The happy part is what happens to the first-order sidebands. Now they have some real zip. Put this signal through an i.f. amplifier of 6 or 7 kc. bandwidth,

The W3QVC f.m. exciter is a compact package. At the right front is the 6AC7 oscillator, with the modulator behind it. Left is the tripler, with the 5763 doubler in the back corner. The voltage-regulator tube is visible in back of the modulator. Note ventilation holes in the side of the bottom cover.

detect it with a good ratio detector or discriminator-following-a-limiter, and presto—f.m. comes into its own!

Rummage through the old *QST*s published just before the war and there you will see the beginnings of a development in amateur f.m. that was nipped in the bud at Pearl Harbor. Look, for instance, at that fascinating article by Murray Crosby on "Bandwidth and Readability in Frequency Modulation," page 26 of March, 1941, *QST*. There we see that for maximum readability of weak signals the deviation ratio should be 1.0, and that such an f.m. signal is always more readable than a.m. In fact, at some weak signal levels this "almost-n.f.m." signal is as readable as an equivalent 100 per cent modulated a.m. signal of *four times the power*. Thus the tables are turned. If it is transmitted and received properly, you can't beat f.m.

\* 1146 Prospect Road, Pittsburgh 27, Pa.

<sup>1</sup> In most locations there is not so much v.h.f. QRM that the extra bandwidth would matter much; and in any case heavily-modulated a.m. transmitters in the region above 144 Mc. are already using more space than f.m. with a deviation ratio of 1.0.

## How To Get Good F.M. Above 50 Mc.

Reactance-tube modulation of a self-excited oscillator just isn't stable enough for good narrow-band work on v.h.f. W1VLII has the right idea in his phase-modulation exciter.<sup>2</sup> A crystal oscillator provides the necessary stability. Reactance modulation of a tank circuit provides phase modulation. The only difference between a p.m. and an f.m. signal is that with p.m. the frequency deviation rises in proportion to the modulating audio frequency (assuming that the amplitude of the modulating wave is held constant), while with f.m. the deviation is the same for all audio frequencies. So the secret of turning p.m. into f.m. is to make the output of the speech amplifier vary in inverse proportion to the audio frequency. Only the r.f. section of an exciter is to be described here, but the speech amplifier that is used with it ends up with a 6SJ7 having an effective load resistance of 50K. A 0.006- $\mu$ f. condenser across this load gives the proper inverse frequency response. A clipper-filter circuit is also used, and this is most desirable.

### A Phase-Modulation Exciter

The exciter shown here is a straightforward, highly stable affair with sufficient output at 48-54 Mc. to drive an 832 tripler to 144 Mc. It uses single-control tuning, for compactness and simplicity of operation. Crystals for 8 to 9 Mc. plug in the front. Shielding, short wiring, and voltage regulation of the oscillator screen all serve to give excellent isolation of the grid-screen oscillator circuit from the phase-modulated plate tank, even though both operate at the same frequency.

The 6AG7 reactance modulator has enough gain and plate-current capacity to provide adequate deviation at 50 Mc., and more than enough for multiplication to higher frequencies. About two volts of audio (at normal voice frequencies) gives proper deviation for the 144-Mc. band. Some care has been taken in by-passing the

screen and cathode of the modulator, as well as in adjusting the grid to ground capacity, in order to eliminate v.h.f. parasitic oscillations.

The plate tank tuning range is determined by  $L_1$ ,  $C_1$ , and other circuit capacities across  $L_1$ . Tracking is accomplished through adjustment of  $L_2$ ,  $C_4$ ,  $L_3$ , and  $C_5$ . TVI is prevented by proper shielding and by-passing. An electrostatically shielded output link helps further in coupling out only the desired frequency. All tubes have protective cathode bias. Power supply requirements are 300 volts at about 125 ma., and 6.3 volts a.c. at 2.7 amp.

### Construction

The exciter is built in a  $3 \times 4 \times 5$ -inch aluminum box (Bud CU-3005 Minibox). Holes are drilled in the cover opposite the mica trimmers  $C_4$  and  $C_5$  to allow adjustment after assembly. They may then be covered with adhesive tape.

The crystal was at first mounted in the center, but had to be moved closer to the oscillator tube to achieve proper isolation from the rest of the circuit. A small aluminum shield partition is placed between the 6AG7 oscillator and the tuning condenser; the cathode by-pass condenser is placed so as to shield the plate contact on the tube socket from the grid; and  $RFC_1$  is small, with a short lead to the screen grid. All these precautions carefully isolate the crystal circuit, to achieve maximum stability.

A small-diameter octal socket allows the tripler tube to be mounted in its limited space. Don't dope the tripler plate coil until its circuit is aligned. Note that the center section of the tuning condenser is used for the oscillator plate; the front section for the tripler plate; and the rear section for the doubler plate. Insulated 'phone tip jacks are used for grid-circuit metering. The modulator screen by-pass in the photographed unit is a mica condenser; a disk ceramic condenser is specified because it is cheaper.

### Adjustment and Operation

The initial tune-up procedure is as follows:

- 1) Put the bottom cover on, but without its screws. Set  $C_4$  to minimum capacity. Plug in the highest frequency crystal to be used, and connect a high-impedance voltmeter between  $J_3$  and ground. Adjust the main tuning condenser for maximum negative voltage. This should be about 130 to 150 volts.

- 2) Change the meter to  $J_4$ , and tune  $C_4$  for maximum negative voltage, which should be around 70 to 90 volts.

Bottom view of the oscillator-modulator side of the f.m. exciter. Note the small shielded partition for isolating the crystal circuit. Two 'phone-type jacks are for audio input and r.f. output. Tip jacks are for measuring tripler and doubler grid voltages.

<sup>2</sup> Southworth, "A Phase-Modulation Exciter for the V.H.F. Man," *QST*, August, 1954.

Bottom view from the tripler-amplifier side. In the foreground are the tripler plate coil and the two mica tracking trimmers. The doubler tank coil is at the right.

3) Plug in the *lowest*-frequency crystal and tune the ganged condenser for maximum voltage at  $J_3$ .

4) Adjust the slug in  $L_2$  for maximum voltage at  $J_4$ .

5) Repeat Steps 1 through 4 until no further adjustments are necessary. The spacing of the turns of  $L_2$  may have to be changed if the slug does not give enough tuning range in the right direction. Remember that minimum inductance is with the slug all the way in. Inductance also decreases as the turns are spread apart. When you are sure the slug will properly align  $L_2$ , dope the turns in place.

6) Now for the output tank. With the *highest* frequency crystal, tune the ganged condenser for maximum voltage at  $J_3$ . Then tune  $C_5$  for maximum output.

7) Try the *lowest*-frequency crystal. Tune the ganged condenser for a maximum voltage at  $J_3$  again. Note which direction, if any,  $C_5$  must be tuned for maximum output. If you had to increase its capacity by tightening it, squeeze the turns of  $L_3$  together a bit; if you decreased  $C_5$ , spread  $L_3$  a little. You will have to remove the bottom cover to do this; be sure to replace it before checking alignment.

8) Repeat Steps 6 and 7 until no change in  $C_5$  is necessary for Step 7.

The exciter is now aligned. Screw on the bottom cover. After this, all you do is plug in the desired crystal and tune the knob for maximum output.

Frequency deviation is adjusted by controlling the output of your speech amplifier. The optimum adjustment is that which gives maximum output without appreciable distortion, at a moderate signal level, in a receiver with a 6- or 7-kc. i.f. bandwidth, equipped with a ratio detector or limiter-and-discriminator. The n.f.m. adapters advertised for a number of the standard commercial ham receivers fill the bill perfectly.

My thanks go to my good neighbor, Andrew B. Potter, for the photographs used in this article.

### The 5100 Transmitter and 51SB Single-Sideband Generator

ANY amateur interested in a complete 'phone/c.w. transmitter in the 150-watt class, to which he can later add s.s.b. with a minimum of effort, will do well to consider the new Barker & Williamson 5100 Transmitter and its companion unit, the 51SB Single-Sideband Generator. When the two units are tied together, switching to c.w., a.m. or s.s.b., or any amateur band, 80 through 10 meters, is simple and quick.

#### *The 5100 Transmitter*

Designed for table-top operation, the 5100 is 22 inches wide, 11½ inches high and 14¾ inches deep. It weighs 83 pounds. The r.f. line-up consists of a 6BJ6 VFO (in the 160-meter band) followed by two 6BJ6 buffer stages. The second buffer stage is grid-block keyed, and serves as the crystal oscillator when crystal-controlled operation is demanded. The frequency-multiplication section of the transmitter uses up to four 6AQ5s, depending upon the multiplication requirement, and this entire section is broadbanded and consequently requires no tuning in operation. The output stage uses two 6146s in parallel, with a pi-network output circuit. A small variable condenser across the grid circuit of the output stage trims the circuit and serves as an excitation control. Recommended operation of the 6146s permits a power input of 135 watts on 'phone and 150 watts on c.w.

The audio section of the 5100 uses a 6U8 triode-pentode speech amplifier, 6AQ5 trans-

former-coupled driver, and a pair of 6146s for modulators.

A low-pass filter is included in the transmitter, which makes it mandatory that the transmitter work into the same load resistance (75 ohms) on all bands. All leads entering or leaving the package are filtered, as a further precaution against TVI. The manufacturer states that the low-pass filter has a minimum attenuation of 85 db. over the TV range, with over 100 db. at Channel 2. The instruction book devotes two pages to suggested antenna systems, apparently to allay any fears that working a transmitter into a given load resistance may represent an insurmountable obstacle. Actually, of course, it is the only way a transmitter with a built-in low-pass filter of this type can be operated, and it has the advantage that the pi-network circuit can be properly designed for the same *Q* on all bands.

Two power supplies are included in the transmitter, a high-voltage one for the 6146s and a low-voltage one for the other stages and for bias voltages. A pair of 5R4GYs is used in the heavy supply and a 5V4G handles the job in the other supply. Two VR tubes take care of the regulation problems.

One bit of unusual circuitry can be found in the frequency-multiplier section where, for d.e., one pair of 6AQ5s is connected in series with the other pair of 6AQ5s across the 600-volt high-voltage supply. This is a good way to utilize a power supply to best advantage, but it is the

A top view of the 5100 Transmitter shows how the construction has been broken down into subassemblies. The r.f. output section can be seen at the left near the panel, while the 6146 modulators are at the right near the panel. The four tubes in the r.f. multiplier section are mounted horizontally.

This view of the 51SB Single-Sideband Generator shows the audio subassembly in the foreground and the r.f. section behind it. The audio phase-shift network is housed in the gray metal-tube envelope between two small transformers.

first time we have seen it in a piece of commercial gear. A similar dodge was used a few years ago in a mobile rig described in *QST*.<sup>1</sup>

For c.w. operation the screens of the output 6146s get their power from the low-voltage supply; on 'phone the screens are fed from the high-voltage supply through a dropping resistor, so that modulation is applied to both plates and screens. For tune-up on either 'phone or c.w., the voltage

of the big supply is reduced by dropping the line voltage through a resistor.

The owner of a 5100 doesn't have to give up the unit when going to higher power — terminals at the rear permit utilizing the audio power (up to 75 watts) to drive a larger modulator.

Looking at the 5100 from the operating stand-

<sup>1</sup> Harrington, "Ten-Meter Mobile With Remotely-Tuned VFO," *QST*, August, 1951.

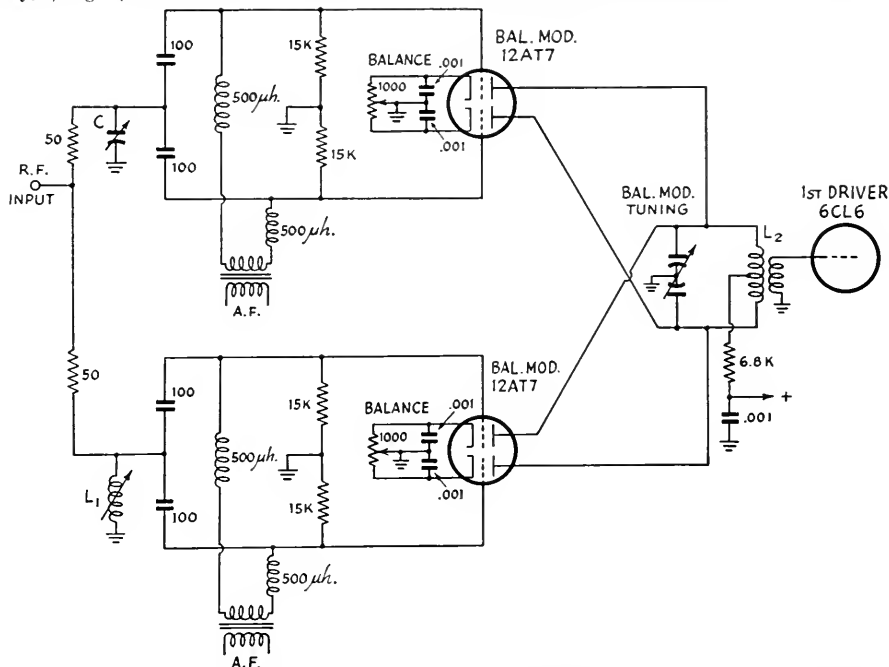

Fig. 1 — Simplified schematic of the balanced modulator circuit used in the 51SB. The r.f. phase shift is obtained by proper constants at  $L_1$  and  $C$ . In the actual unit, these constants are switched for each band change, as is  $L_2$ . Sideband selection is obtained by reversing the polarity of one of the audio channels. One cathode of each balanced modulator is opened for carrier unbalance when tuning the following r.f. stages.

The r.f. subassembly of the 51SB, with the bandswitch shaft and the balanced-modulator tuning shaft removed to permit better visibility of the parts. The compartments, from left to right, are 6V6 amplifier (the shield straddles the socket), 6CL6 amplifier, balanced modulators, and r.f. phase-shift networks.

point, the front panel carries the VFO knob (a large one), bandswitch, meter switch for measuring grid and plate current of the output stage and plate current of the modulator, a CW-VFO-PH switch for selecting the mode and for spotting frequency, and A.C., Tune-Operate and Plate switches. Once the band is selected, the operator has only to set the VFO and adjust the plate tuning and loading controls of the output stage, touching up the excitation control also, if necessary. The VFO frequency can be easily read on the slide-rule type scale.

### ***The 51SB Single-Sideband Generator***

The companion s.s.b. generator for the 5100 is a small  $10 \times 11\frac{1}{2} \times 14\frac{3}{4}$ -inch package that is placed to the right of the transmitter and tied in electrically with interconnecting cables and mechanically with bolts. Once it is properly connected to the 5100, it is a relatively simple matter to change from s.s.b. to a.m. or c.w. and back again.

The 51SB takes r.f. at the output frequency from the 5100 multiplier section and generates s.s.b. at the output frequency through audio and r.f. phase shifts. Fig. 1 shows a simplified schematic of the two balanced modulators. The audio section of the 51SB uses  $1\frac{1}{2}$  sections of 12AT7s in cascade before the audio is introduced into the audio phase-shift network. A 3500-cycle cut-off low-pass filter ahead of the network protects the network from audio frequencies beyond its range. From here the signal is amplified and then transformer-coupled into the two 12AT7 balanced modulators. The voice-controlled break-in and antitrip (for loudspeaker operation) circuits use 12AT7s and a 6AL5. The output of the balanced modulator is amplified through a 6CL6-6V6 chain to build up the amplitude to the point where it is sufficient to drive the pair of 6146s in the 5100 transmitter. Two tuning controls are included in the s.s.b. generator: the balanced-modulator output circuit and a ganged control for the 6CL6 and 6V6 plate circuits. The r.f. phase-shift networks are broadbanded and do not require adjustment. Consequently, the tune-up procedure of the 51SB is quite similar to the tune-up of any series of r.f. stages, and the operator does not have to be familiar with how s.s.b. works to put the rig on the air. A switched meter in the unit monitors the grid current of the 6146s and, by using a pair of germanium diodes, the output of the 6V6 driver. The r.f. output position

is used to set up the two carrier-balance panel controls.

The voice-operated control circuit closes a three-pole double-throw relay that provides a keying circuit for the transmitter, an antenna relay control circuit, and a receiver-silencing channel. Adjustable voice-control threshold and hold-in controls are available inside the unit, as is the antitrip sensitivity control. The unit can be used "push-to-talk" from a switch on the microphone or with full voice-controlled break-in, as desired.

Most of the panel controls have been mentioned, but in addition there is a carrier-unbalance switch (for tune-up), upper or lower sideband selector switch, bandswitch, tune-operate switch, and an audio gain control. In operation it is necessary, of course, to make sure that the bandswitches on the 51SB and the 5100 are set to the same band. A minor inconvenience, but nothing to worry anyone who has gone this far in equipping a complete station, is the necessity for changing microphone from unit to unit when going from s.s.b. to a m., but this could be solved by using two microphones or a shielded switch.

All of the power leads leaving or entering the 51SB are filtered, in keeping with the TVI precautions in the 5100. A 5Y3G in the power supply handles the plate-power requirements of the exciter.

### ***General***

In both the 5100 and 51SB, considerable use has been made of subassembly type construction. This is illustrated in the accompanying photographs. The subassemblies are a production expedient, of course, but they also contribute to shielding within the unit.

Instruction books for both units are careful to give step-by-step instructions for all operations, and anyone who takes the time to read them should have no trouble.

Of special interest to home constructors of s.s.b. gear is the little audio phase-shift network used in the 51SB. It is similar to others on the market in that it provides a 90-degree shift over the 300-3000-cycle range, but this one is completely enclosed in a metal-tube envelope of the size used for a 6J5. Thus, plug-in convenience and good shielding are provided in a very small package. This unit, the B & W Model 350, is marketed separately.

— B. G.

## 260 Series Power-SWR Meters

THE newest additions to the MicroMatch line of instruments for measuring power and standing-wave ratio feature operating convenience: With these meters it is no longer necessary to reverse the r.f. input and output connections in making measurements of forward

line balances out the forward voltage and responds to the reflected voltage, which is rectified by  $CR_2$ . The voltmeter, a 0-200 microammeter with appropriate series resistors for several usable voltage ranges, can be connected to either circuit by means of the single-pole single-throw switch.

The two types of indicator units, Model 262 at left, 263 at right. The principal difference is in the switching arrangement used for measuring forward and reflected power and for changing the full-scale range.

and reflected power, as was the case with the original MicroMatch. The Models 261 and 263 each consist of essentially two MicroMatch bridges arranged back to back so that one reads the outgoing voltage continuously while the other monitors the reflected voltage.

Fig. 1 — Basic circuit of the back-to-back bridges used in the Models 262 and 263 MicroMatches.

The basic circuit by which this is accomplished is shown in Fig. 1.  $R_1$  is the series resistance of the original MicroMatch circuit.  $CR_1$  is the voltmeter rectifier for reading the forward voltage. The bridge formed by  $R_1$ ,  $C_1$ ,  $C_2$  and the transmission

Both models consist of a "coupler unit" and an "indicator unit." The former contains the actual bridge and the latter the voltmeter and multipliers. The coupler units are identical in both models except for the line connectors; regular coax fittings are used on the 261 and "N" type fittings on the 263. The indicator unit for the Model 261 (it has a separate number, 262) uses a variable resistor as a multiplier, with calibration points for 10, 100 and 1000 watts full-scale reading marked on the resistor scale. The Model 263 indicator uses an individual factory-adjusted variable resistor for each of the same three ranges and selects them with a switch. The meter calibration is in watts and is the same on both indicators — 0-10, 0-100, and 0-1000 — and the same type of meter is used in both. The actual power delivered to a load is found by taking the difference between the forward and reflected power readings. The voltage standing-wave ratio is found by taking the ratio of the forward to reflected power and reading the corresponding v.s.w.r. in instruction book chart.

Either coupler can be left in the transmission line continuously, provided the power does not exceed one kilowatt with an s.w.r. of 1 to 1. The bridges are designed for 52-ohm lines.

The circuit of a measuring instrument is rarely

Internal construction of the coupler unit is shown by the view with the cover removed, at the left. The unit comes furnished with protective caps for the coax connectors as shown at the right. The units are designed for use with 52-ohm lines.

the whole story of its performance, as the sources of error are seldom obvious. The accuracy of a bridge of this type is almost entirely determined by the selection of components and the method of construction. The inside view of one of the coupler units shows the special constructional arrangement adopted to maintain accuracy over the frequency range from 3 to 225 Mc., and to pre-

vent the coupler from introducing an impedance "bump" in the line. The insertion loss is stated to be less than 0.1 db.

Couplers and indicators can be obtained separately. The instruction book with the coupler contains circuit information for home construction of an indicator unit, in case only the coupler is purchased. — G. G.

## The RME-100 Speech Clipper

THE advantage of speech clipping should be quite well known by this time. Modulation percentage is limited by the amplitude of the modulating wave form, rather than by average modulating power. The speech clipper increases the ratio of average modulating power to peak amplitude by clipping the peaks of the wave form. This increases the average percentage of modulation, improving the intelligibility without increasing the transmitter power. Since clipping introduces distortion in the form of harmonics, a filter for the harmonics follows the clipper.

The RME-100 consists of a two-stage preamplifier, using a 6SC7 dual triode, followed by a 6H6 clipper and a harmonic filter. Power supply is included in a unit measuring 5 by 6 by 7 inches.

The circuit is shown in Fig. 1. The unit is designed to be inserted between the microphone and the first stage of the speech amplifier, and a switch is provided for cutting the unit in or out of the circuit. The gain is limited to about 6 db. at the maximum clipping level so that a minimum of readjustment of the speech-amplifier gain control is necessary when the clipper is switched in or out.

About 15 millivolts of audio is required to produce a full 24 db. of clipping. This is usually obtained from a crystal or dynamic microphone when talking normally with the microphone at a distance of about 3 inches. The clipping control

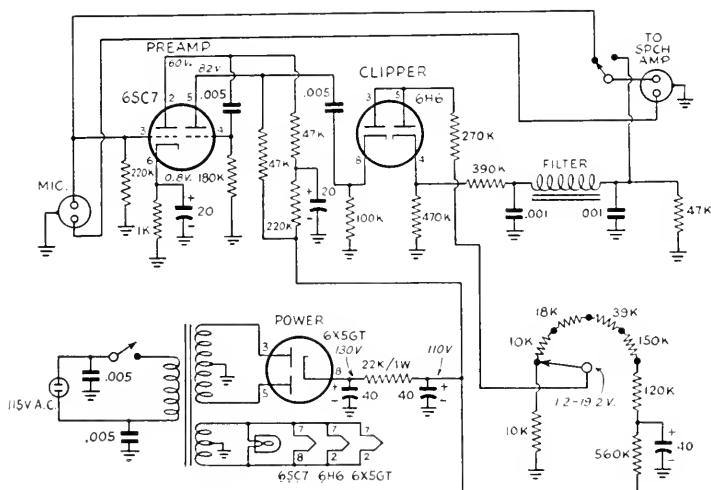

switch has 5 positions, 0 to 24 db. in steps of 6 db.

The clipper feeds into a low-pass filter, attenuating frequencies above 3000 cycles at the rate of about 20 db. per octave, and limiting the sideband width. At the low-frequency end, the amplifier has a roll-off characteristic attenuating

The RME-100 Speech Clipper in its streamlined cabinet.

frequencies below 300 cycles. The output impedance is 47,000 ohms, and the input impedance of the stage into which the unit feeds should be a minimum of 100,000 ohms. Hum level is 40 db. below signal at average clipping level.—*D. M.*

*Fig. 1* — Circuit of the RME-100 speech clipper. All resistors  $\frac{1}{2}$  watt unless otherwise specified. All capacitances in  $\mu\text{f}$ .

## The P-500 Power Amplifier

THE Lakeshore Industries P-500 power amplifier is another in the current crop of power amplifiers designed primarily to boost the power level of a single-sideband signal. It uses a pair of 5514 triodes in push-pull, with multiband tuners<sup>1</sup> in the grid and plate circuits to cover the amateur bands from 80 to 10 meters. As a consequence, there is no bandswitch of any kind, and the panel has two dials, for the grid and plate tuners, and a knob for controlling the

and the bias supply are at the rear of the chassis, as are the connectors for r.f. input and output. The bias supply to be used will, of course, depend upon the plate voltage available. The factory recommendation is a plate supply of 1000 to 1250 volts. The output terminals provide for connection to either balanced or coaxial line.

Circuitwise, the P-500 is similar to any other neutralized push-pull triode amplifier, except perhaps for the use of tapped parasitic r.f. chokes

The Lakeshore Industries P-500 power amplifier uses a pair of 5514 triodes mounted horizontally. Multiband tuners both in grid and plate circuits eliminate the need for a bandswitch. Normally, the grid-circuit compartment is covered by an aluminum plate.

The construction of this unit is interesting in that no normal "chassis" is used. The grid compartment is a box within the larger box that makes up the unit. A cane-metal top covers the box shown here, and the whole unit then fits into a painted cabinet.

grid-circuit coupling. A 0-500 milliammeter on the panel is connected in the filament return to ground and reads the total of grid and plate currents.

The line cord coming out the rear of the cabinet connects to the filament transformer—terminals for connecting to the plate supply

in the plate leads and 56-ohm resistors in series with the neutralizing condensers. (A number of triode amplifiers used as linears seem to require these resistors; e.g., the 811-A amplifier described in March, 1951, *QST*.) Loaded parasitic-suppression chokes are also used in the grid circuit, together with a 2700-ohm swamping resistor for better driver loading.

### Operational Readiness Vital to Successful Disaster Work

Operational readiness is the key to success in disaster communications service and for public service operations where the time element is important. Two recent examples of alertness and operational readiness follow:

In the first instance, an earthquake rocked the Fortuna, Calif., area at 1956Z hours on 22 December 1954, causing extensive property damage. T. V. Conroy, A6GQY, of Fortuna immediately established an emergency link with Sixth Army Headquarters and with the Civil Defense

Coordinator for Region One, Col. T. Monroe. The circuit was in operation at 2004Z, just eight minutes after the initial shock. Communication was maintained continuously until 0215Z on the 23rd when it was officially determined that services of the Sixth Army Engineers would not be required. A6GQY reports that circuit discipline on 4020 and 4025 kc. was excellent.

Five days earlier, on 17 December 1954, a radio link was set up between Clovis (N.M.) Air Force Base and Goose Bay, Labrador, to provide medical information concerning an airman who had been bitten by a rabid dog. Stations A5HJF and AA5WSP were instrumental in this operation. A relay was established between Goose Bay Dispensary and the Clovis Air Force Base Hospital so that additional information could be transmitted. The Air Force MARS emergency frequency of 3838 kc. was used.

## GOLDEN NETWORK

Granite City, Ill.

Editor, *QST*:

The hams in this area did a wonderful job of collecting pledges during the 38-hour telethon for the benefit of Cerebral Palsy victims. The entire St. Louis, East St. Louis, Granite City, Madison, Venice, Alton area was blanketed by mobile operators who gathered in the gold as it was pledged via land line to several hundred operators at the Keil Auditorium Cerebral Palsy headquarters. About \$50,000 was pledged and picked up by the mobile hams. W9QDF was the spark plug who mustered the hams into the drive and created an efficient mobile pick-up network, but just about every operator in the area deserves credit for having given of his time to make the drive the success that it was. Hundreds of fixed stations were involved, all controlled by W9AIU, the Egyptian Radio Club Headquarters.

— *Egyptian Radio Club, Inc., W9AIU*

## 21-MC. VIOLATIONS

Pleasant Street  
Rochdale, Mass.

Editor, *QST*:

Several times while operating 21-Mc. 'phone there have been more W stations in the foreign 'phone section than there has been DX.

This may be attributable to the fact that the band is fairly new or that the majority of receivers do not have too accurate frequency markings, or none at all for the band. Of course, there is also the possibility that some Ws do not know the limitations of the American 'phone band on 21 Mc. So, I would recommend that in the near future a listing be made of 21 Mc. showing the frequency restrictions and pointing out the band limits. I hope this note will possibly save someone from receiving a "pink" ticket for out-of-band operation.

— *Kenneth Schofield, W1RIL*

[EDITOR'S NOTE — As shown again in "Happenings" this month, the voice segment is 21,250–21,450 kc.]

## NOVICE CHANGE

331 Forest Drive, S.E.  
Cedar Rapids, Iowa

Editor, *QST*:

I should like to hear some discussion on proposing a change in Novice regulations to extend the term to "one year or to the 13th birthday." I think the younger guys and gals should be given a break. What do you say gang?

— *R. Ray Weeks, W0LPK*

## FOR THE BIRDS

Hobbs, N. Mex.

Editor, *QST*:

I think it's about time I had my say about one of my pet gripes: c.w. in the 'phone bands. This is for the birds! I'll admit c.w. was here first, and it undoubtedly has its place in ham radio, but I personally think it is a thing of the past.

I think the 'phone bands should be reserved for 'phone operation. After all, if c.w. operators are going to be allowed to have large portions of each band set aside for their exclusive use, with big keep-off signs posted to 'phone men, it is only fair that 'phone men should enjoy the same rights.

Any night you can hear c.w. and teletype all over the 75-meter 'phone band, while there are wide-open spots all over the c.w. portion.

I was enticed into ham radio by the reduced code-speed requirements of the Novice ticket, and now I am being booted out by the c.w. and Sloppy Splatter-Band operators. Don't misunderstand me; I like ham radio. I've learned enough radio since going on the air as an amateur to pass my commercial 'phone exam.

All I'm asking is fair treatment for all hams. If a man wants to operate c.w., that's his business, but if the FCC is going to let him have his run of 'phone bands, then let the 'phone men into the c.w. bands.

— *M. J. Clark, W5UWQ*

## IT'S FOR THEM

326 So. Walnut Street  
Cookeville, Tenn.

Editor, *QST*:

There has been quite a big blow for the past few years about putting both c.w. and s.s.b. off the air. Or at least off the 75-meter 'phone band. Both of these modes of transmission seem to bother the a.m. 'phone men. I think the principal reason for this is the fact that most of the a.m. 'phone men have forgotten what their b.f.o.'s are used for . . . if they ever knew. Anyway, they couldn't read c.w.

What I would like to know is this: Would it be possible to put a.m. 'phone (the kind with a carrier and two sidebands) off the air completely?

There is a good argument for this action. Both c.w. and s.s.b. rigs are much more economical to build and operate. They are both less likely to cause TVI. They both can be operated with greater spectrum economy.

In a 15-ke. segment, only one a.m. 'phone station can be operated without interference. (I have heard several of the kilowatt-give-or-take-a-hundred-watts rigs around here that are much broader than 15 kc.) But in the same 15-ke. segment, two s.s.b. stations and ten c.w. stations may be operated without cross-interference. This is figuring the s.s.b. stations as being 3000 cycles wide and the c.w. stations operating within 900 cycles of each other, which is entirely practicable.

I would like to hear from other hams and get their opinions on the proposal of outlawing a.m. 'phone. The time has come that we cannot waste any parts of our crowded amateur bands!

— *Al Brogdon, W4UWA*

R.F.D. No. 2  
Bradford, Ohio

Editor, *QST*:

A year or so ago, when s.s.b. began to be an issue, I was violently and openly opposed to any part of it. However, this past summer I had plenty of time to do some considering of the issue. After careful study and consideration of the subject, I had to admit that perhaps some of my personal and "technical" opinions didn't add up to the right answer — that is, what I wanted them to add up to. I went so far as to visit a s.s.b. station, and talked over the rig. It made sense. After some more study I bought an exciter, built an amplifier, with the purpose in mind of finding out for myself what s.s.b. had and didn't have to offer.

I found out some of the following things. The s.s.b. group of operators, by the somewhat more technical nature of their equipment, are trying to do a good job, and are forced by the criticisms of others in their group to radiate a reasonably good signal. The group is immediately critical of a bad

(Continued on page 142)

# Happenings of the Month

## NATIONAL AMATEUR RADIO WEEK

Senator Prescott Bush of Connecticut, joined by Senator William A. Purtell of Connecticut and Senator George A. Smathers of Florida, has again this year introduced into the Congress a Resolution (S. J. Res. 25) to designate one week in the month of June each year as National Amateur Radio Week. The text follows:

*Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the President of the United States is authorized to designate one week in June of each year as National Amateur Radio Week, and to issue a proclamation inviting the people of the United States to observe the week with appropriate exercises to further and stimulate interest in amateur radio in the United States.*

The measure has been referred to the Judiciary Committee of the Senate. If passed by the Senate, the bill will then go to the House for similar action. We understand that the Federal Communications Commission has endorsed the bill this year, and this action is interpreted as affording the measure a better chance than last year, when a similar resolution died in Committee. It is the intention of the language, if adopted, to select each year the week ending with the annual ARRL Field Day tests.

In introducing the bill, Senator Bush addressed his colleagues on the Senate floor as follows:

Mr. President, radio amateurs in the United States have made invaluable contributions toward the advancement of radio. In times of emergency, local and national, they have performed essential services to the public by providing a network of communications linking agencies dealing with disasters.

Connecticut is especially conscious of the contribution to the general good made by these men and women, affectionately known as "hams," because the American Radio Relay League, their official organization, has its headquarters in our State, at West Hartford. . . .

The month of June was selected because during that month each year is held the American Radio Relay League's annual field day in which more than 7000 amateurs throughout the country set up portable and emergency-powered radio communications in remote areas and man the gear in shifts for 24-hour periods. The purpose is to demonstrate the skill of volunteer amateur radiomen in providing emergency communications service in the event of disaster — military, civil or natural.

The week of this event would be a most appropriate one for designation as National Amateur Radio Week.

At this point interested amateurs and club groups who would like to see such a "week" can help by writing brief letters to members of the Senate Judiciary Committee urging favorable action on the resolution; individuals and groups

in the states represented on the Committee can be most effective. The list of Senate members, who can be addressed simply at the U. S. Senate Office Bldg., Washington, D. C., is:

Arkansas — John L. McClellan  
Idaho — Herman Welker  
Illinois — Everett M. Dirksen  
Indiana — William E. Jenner  
Maryland — John Marshall Butler  
Mississippi — James O. Eastland  
Missouri — Thomas C. Hennings, jr.  
North Dakota — William Langer  
South Carolina — Olin D. Johnston  
Tennessee — Estes Kefauver  
Texas — Price Daniel  
Utah — Arthur V. Watkins  
West Virginia — Harley M. Kilgore  
Wisconsin — Alexander Wiley  
Wyoming — Joseph C. O'Mahoney

The League is of course filing a statement urging its adoption, in language similar to that shown on page 53 of May 1954 QST.

## F.C.C. REGION CHANGES

In January FCC completed the revision of its regional-office set-up by dropping the regional office at Detroit and redesignating supervisory responsibilities to the Chicago regional office in the case of the Detroit district office (No. 19) and to the New York regional office in the case of the Buffalo district office (No. 20). This action has no effect on amateur examination schedules, but is of interest to TVI committees in the Detroit and Buffalo districts since they will now have liaison with new regional offices.

The total of regional offices is now reduced to six, those at Houston and Anchorage, Alaska, having been closed last year.

## REEXAMINATION AMENDMENT

To clarify the eligibility of applicants for amateur licenses to take another examination after having failed one, FCC has modified the language of Sec. 12.49 of our rules. It now says:

*Eligibility for re-examination.* An applicant who fails examination for an amateur operator license may not take another examination for the same or a higher class amateur operator license within 30 days, except that this limitation shall not apply to an examination for a General Class license following an examination conducted by a volunteer examiner for a Novice, Technician or Conditional Class license.

The principal effect is to make it plain that failing applicants for Novice and Technician Class licenses, now all handled by mail, have the same privilege as those failing Conditional Class — i.e., to appear before an FCC examiner and take the General Class exam without waiting 30 days. In fact, they can go up the very next day if they wish.

(Continued on page 144)

# QST—Volume III

## Part I—Foreword to Sumner B. Young's (WØCO) Index†

VOLUME III was the first complete volume to be produced under the guidance of a full-time editor. Its twelve issues extended from August, 1919, to July, 1920. Much information lies between its covers; but to collect and to organize it is often very difficult.

By all odds, the most important story recorded in this volume was the development of amateur "tube" transmitters by a small group of experimentally-inclined and progressive amateurs; and it is a pity that the material in *QST* is of such nature that only a few of the individual participants can now be identified.

No large-scale shifting over to c.w. transmitters occurred, although some unsupported general statements published in the magazine may imply the contrary. Later, there was a quickening of interest in c.w., during the period covered by Volume IV; but the real rush came only after the results of the first successful "Transatlantics" had been announced, in January, 1922. See Volume V.

Back in the days covered by the two postwar issues of Volume II, there had been some signs of interest in c.w. methods of transmission, even before the Navy had lifted the "lid" on "sending."<sup>1</sup>

Volume III's first offering of information on the subject was an unsigned article called "More About V.T. Transmitters."<sup>2</sup> It showed a circuit "found quite satisfactory on some sets supplied

the government during the war," and specified the size of an antenna coil for 200-meter operation. A second circuit "developed by the Marconi Company especially for use with the Marconi-DeForest V.T., and said to give the best results for that tube of any circuit tested," was diagrammed.

An unusual feature of this article was a suggestion that c.w. sets be developed which would use the same tubes for transmitting and receiving; and a sketch showing a possible application of the idea was given. The author (whoever he was) added: "... We believe that the ideal c.w. set of the future will incorporate some such feature as this."<sup>2A</sup>

An announcement at 24, 30, September 1919, probably referring to the DeForest Telephone & Telegraph Company, read as follows:

We are promised that soon the amateur world will have a bulb transmitter complete, designed primarily as a radiophone but also an efficient c.w. telegraph, and at a reasonable price. It sounds almost too good to be true but we believe it can be done. This set is being developed by a prominent commercial company and should be announced soon.<sup>3</sup>

The "Liberty Number" (November 1919), under "Strays," carried this important call for information, at page 32:

Anybody working c.w. sets on 200 meters? We'd

† "QST—Volume I" appeared in October, 1954, *QST*, p. 40; "QST—Volume II" appeared in February, 1955, *QST*, p. 42.

<sup>1</sup> At 19, June 1919, J. O. Smith, traffic manager of the League, said that many stations were then installing, or planning to install, undamped transmitters; and he pointed out some of the great merits of these sets.

Warner's "Essentials of V.T. Transmitters" had appeared, at 3 to 6, July 1919.

An unsigned article called "On Resuming Transmitting," at 18 to 19, July 1919, had characterized v.t. transmission as "perhaps the most important development of wartime radio from our standpoint." [Italics by S. B. Y.]

<sup>2</sup> 22, 24, September 1919.

<sup>2A</sup> This suggestion was repeated, with approval, at 48, February 1920, in the article "Auto-Modulated C.W. Telegraphy."

<sup>3</sup> See the ad of the DeForest Radio Telephone & Telegraph Company, on the inside back cover of the November, 1919, issue. The set operated on 60-cycle 110-volt a.c.; and the "tested ranges" were stated as: "telephone 10 to 20 miles," and "telegraph 50 to 75 miles." The price was \$200.00, complete, including bulbs. The operating wave-

lengths were not stated. Rectifier-tubes were used to produce h.v. plate current.

<sup>4</sup> I can testify, from experience, that the early amateur c.w. transmitters simply would not work on wavelengths much below 300 meters.

See the "Editor's Note" appended to E. W. Whittier's article, "A Sure-Fire C.W. Circuit," at 29, July 1921 (Volume IV).

In a "C.W. Building-Contest," conducted by the Radio Club of Hartford, it was specified that the operating wavelength of the transmitters entered in the competition should not exceed 200 meters. Only two sets submitted would "get down" even as low as 200 meters. These were built by F. H. Schnell (1MO) and J. C. Randall (1ANQ). Both rigs would operate as low as 180 meters. See 24 to 25, September 1921 (Volume V).

At 13, November 1921, McMurdo Silver stated that it was then possible to operate an amateur transmitter, efficiently, below 200 meters (Volume V). At 63, January 1922 (Volume V), Kruse (in a letter) stated that c.w. transmitters could easily be operated below 200. At 50, February 1922 (Volume V), a "Stray" reported that 9ZT could "put out" one ampere of c.w. on 125 meters, but that he could find nobody who was equipped with a receiver tuning down that low.

be glad to have a description of any that are proving successful. We're afraid we're going to have lots of trouble with 200-meter undamped. The frequency is so high that an extremely precise adjustment of the heterodyne frequency must be made at the receiver.<sup>4</sup>

On the same page, right below this item, another Stray referred to the shortage of suitable transmitting tubes for amateur use:

The only power tube available for us seems to be the so-called Marconi tube, made by Moorhead and licensed by DeForest for the use of three electrodes. The Marconi Co. have enjoined DeForest from the manufacture of the Oscillon, on the grounds that it violates the Fleming patents. It takes rather a stretch of the imagination to see how this can be.<sup>5</sup>

A motor generator, designed to produce h.v. d.c. for plate circuits in tube transmitters, was first advertised in *QST* in the December, 1919, issue. The International Radio Telegraph Company, of 326 Broadway, New York City, offered a 100-watt unit (200 ma. at 500 volts) for \$75.00, f.o.b. factory.<sup>6</sup>

In any event, a small and diversified group of amateurs decided to pioneer in the tube-transmitter field. It is difficult to identify and to locate them, in most instances, from the pages of *QST*; but a few published items are of limited assistance.

<sup>5</sup> I can testify that a fairly active "black market" for various tubes developed around Greater Boston shortly after the "lid" was lifted on transmitting. "Western Electric" transmitting tubes, rated at 5 watts, could be had for around \$10.00 or \$15.00 apiece.

A "Stray," on page 32 of the November, 1919, issue, stated that the Marconi v.t. was a pretty good tube, however; and this paragraph cited the success achieved by a hurriedly-constructed transmitting set which had been installed aboard the U. S. S. *George Washington*. Using one Type "RH" Moorhead tube, that ship had worked Otter Cliffs, Maine (on c.w.), while 1200 miles out. The plate voltage was only 750. The wavelength used was not stated.

A "Stray" (at 24, December 1919) spoke of "salvaged" VT-2s for amateur c.w. transmitters. I am glad that some "salvaging" was done. A year or two would have been wasted, if "irregular" supplies of tubes had not been tapped.

<sup>6</sup> 54, December 1919. Also, see the "Stray" at 24, December 1919, which reads: "At last a cheap and good motor generator set for high-voltage d.c. has arrived. . . . Its lack heretofore has been the big drawback to amateur V.T. transmission. . . ." [Italics by S. B. Y.] For a scheme for converting "ceiling-fan" motors into h.v. d.c. generators, see "Strays," at 43, June 1920.

*Motor generators were considered an expensive item by most early hams. Also, the noise and vibration from them were annoying.*

Some of the biggest boosts later given to c.w. work were furnished by the development of other means of producing h.v. d.c. First came the electrolytic rectifier; and then came rectifier tubes, plus filter systems.

On the advent of the electrolytic rectifier, see: "An Electrolytic Rectifier for C.W.," by P. J. Furlong (1FF), at

At 34, February 1920, J. O. Smith declared:

. . . The short-wave c.w. set has arrived. There is no doubt but that the development of these short-wave c.w. sets will greatly add to the interest and welfare of amateur radio. A few of these sets are now in operation in the Atlantic Division. . . .

At 48, February 1920, it is recorded that 2AB (N. Y. City) worked 3ZH (Trenton, N. J.) on buzzer-modulated telegraphy, with 1.1 amperes in the antenna; and that 8DA (in Ohio) heard 2AB's signals "very QSA."

At 28, March 1920, Entwistle's Report identifies Stuart Briggs and Fred Bowditch (both of Brookline, Mass.) and Francis Pray (of Somerville, Mass.) as the owners and operators of "undamped transmitters."

The April, 1920, issue of *QST* contained an article (probably by Warner) entitled "The Advent of Amateur C.W." <sup>7</sup> This mentioned some of the "pioneers":

. . . 2ZV, Richmond Hill, L. I., is using a 340-meter wave for c.w. telegraphy, compensated wave 350 meters, with an antenna current of 6 amperes, representing 350 watts. The oscillating equipment is two Type P plotrons. This station should be good for 1500 miles.

. . . Others we know of are 2ZL, 2FS, 2AB, 2EX,

17 to 18, 28, February 1921 (Volume IV). For its later development, see: "A Symposium on Aluminum Electrolytic Rectifier Operation," edited by S. Kruse, at 20 to 25, June 1922 (Volume V).

On rectifier tubes, plus filters, see the following references. In Volume III: "Construction of a 500-Volt Rectifier Transformer for C.W. Work," by Robert Muns (2ACQ), and editorial note thereto appended, 17 to 19, June 1920. In Volume IV, see: 9, September 1920; and 36, November 1920 (Russell's report). Volume V references: 28 to 29, October 1921 ("S" Tubes, with smoothing filter); 25, April 1922 ("Rectifier Battle," at Third and Fourth District Convention); and 12, March 1922 (only three of the successful stations in the "Second Transatlantics" used tube-type rectifiers).

On h.v. synchronous rectifiers, see the following reference in Volume V: 18 to 19, June 1922 (editorial note). The synchronous rectifiers never achieved wide use.

At 49, November 1920 (Volume IV), Arthur K. Ransom, in a letter, expressed the opinion that the need for producing h.v. d.c. was the biggest obstacle to the widespread adoption of c.w. transmitters by amateurs.

<sup>7</sup> 13, 14, 16, April 1920.

Note that NSF, the Naval Radio Laboratory at Anacostia, Washington, D. C., is mentioned, in this same article (p. 13), as "testing bulb sets of various powers on 200 and 425 meters, using straight and chopped c.w."

Also note that some experimental work by the Glenn L. Martin Co., of Cleveland, is mentioned: ". . . One set puts 2.5 amperes in the antenna on 180 meters with 250 watts input, and the other set 4 amperes on 270 meters with an input of 350 watts. . . ." [Italics by S. B. Y.]

The Glenn L. Martin Co. stations used Air Service calls (UM and CMC). See 13, April 1920.

2ZM, SXK, 8YO, and 2XX. 2XX, ex-2XG, the station of Mr. Robert F. Gowen at Ossining, New York, has secured perhaps the best distance to date, signals being nightly QSA in Little Rock, Arkansas. Voice modulated and straight undamped are used.

... Probably the most interesting work is that done by 2ZL, the station of our traffic manager, Mr. J. O. Smith. *That the c.w. is proving up is attested by the fact that 2ZL is junking its spark set as outgrown.* The equipment consists of a few small oscillators in parallel, with an antenna current of 1.2 amperes, straight c.w. on 275 meters. ... Traffic has been put thru to Ohio and Massachusetts by this station when the spark signals were powerless to combat QRM and QRN.<sup>8</sup> ... [Italics by S. B. Y.]

J. O. Smith's "Operating Department Report" (at 28, April 1920) adds no more c.w. stations to the list, but makes this encouraging comment:

... Short-wave c.w. transmission has done much more than was expected of it, in that it has turned out to be a very docile, tame and willing worker, instead of a fly-by-night, unreliable, unsteady means of communication. More power to it. ...

At 34, January 1920, the "Calls Heard" list of L. E. Furrow (420 Lake St., Troy, Ohio) states that on December 8, 1919, he heard station DA and station 3ZH working one another, both on c.w. and on 'phone. *This is the first mention of v.t. transmissions by amateurs which I have been able to find in that particular department of QST.* DA was probably an unlicensed station.

The one-tube 20-watt c.w. transmitter of Mr. Carter, of Cleveland (call UM), is referred to in SDA's list of "Calls Heard" at 42, March 1920. The call UM appears also to have been used by the Glenn L. Martin Aircraft Co., at Cleveland; and it is said to have been an old Air Service call. See 13, April 1920, and the editorial note to the letter from H. V. Simmons, at 54, July 1920. However, it may well be that Mr. Carter's station, signing the call UM, was an unlicensed station. SDA (at Salem, Ohio, 60 miles away), stated that he worked UM regularly.

Don Mix (1TS, of Bristol, Conn.), whose "Calls Heard" lists eventually earned him the nickname of "Sleepless Wonder," reported hearing several stations on 'phone and modulated

telegraphy. See his list at 51, April 1920.<sup>9</sup>

The May (1920) issue of the magazine contained another leading article (unsigned) entitled: "An Experimental C.W. Transmitter."<sup>10</sup> It featured the Colpitts circuit, described as "a little complex, but beautiful in principle."<sup>11</sup> For amateur use, Western Electric VT-2s, General Electric VT-1s, and Class II Marconi bulbs were recommended.<sup>12</sup>

This May (1920) issue also contained a statement by J. O. Smith, at page 26, indicating that many amateurs desiring efficient transmitters had installed c.w. rigs. No statistics were given.

At page 31 of this same number, R. H. G. Mathews (9ZN) said that he was thinking of adding a  $\frac{1}{2}$ -kilowatt c.w. transmitter to his station during the coming summer or fall of 1920. This was real news, because in March (1920) 9ZN's spark, on 275 meters, had established a new record for amateur stations.<sup>13</sup>

The June (1920) issue carried an announcement that the Nola Radio Club (of New Orleans, Louisiana) was experimenting with radiophones and c.w. sets.<sup>14</sup>

At page 51 of the same issue, O. A. Gullledge (4AT), of Ft. Pierce, Florida, announced (by letter) that he had installed a DeForest "Oscillion" radiophone; and that he would send out "music, speech, and c.w. signals," at stated times, on 200 meters.

A well-written article, showing touches of true wit and humor besides, was published at 15 to 17, July 1920: "C.W. for the Amateur," by Howard L. Stanley (2FS).<sup>15</sup> He described a c.w., m.e.w., and 'phone transmitter which he had developed with the help of 2ZL (J. O. Smith).

More generalities appeared in Warner's editorial (called "C.W.") at page 24 of the July, 1920, issue:

Reports from all over the country show the gradual but sure trend from spark to undamped in amateur radio, just as we thought would develop, and we are glad to see it.

We are strongly in favor of c.w. and are going to do all we can to help it along. ...

We are on the eve of a great transition in amateur methods. We plead for the undamped the serious consideration that its many advantages merit.

<sup>8</sup> The final paragraph in this article (16, April 1920) contains this interesting language: "The Editor urges the adoption of c.w. by all serious experimenters as a field of highest interest and unlimited possibilities, but with the warning that they'll have to learn transmission all over, for the old dope of spark days will not apply. QST hopes in the near future to establish a special laboratory for c.w. experiments looking toward the development of sets particularly adapted to 200-meter relay work."

<sup>9</sup> He listed the following: 2XG ('phone and modulated telegraphy); 2XJ ('phone); 2XX ('phone and modulated telegraphy); 2ZL (spark and modulated telegraphy); 2ZY (spark and modulated telegraphy); SCO ('phone); and 8XU (spark and modulated telegraphy).

A few more early tube sets can be identified by referring to other lists of "Calls Heard," in later numbers of Volume III of QST.

At 44 to 45, July 1920, 1TS reported hearing 1AW on spark and 'phone; 2FS on spark and c.w.; 2XB on c.w. and 'phone; and 2XK on spark and modulated c.w.

At 46, July 1920, the Waverly (N. Y.) Radio Research Assn. reported hearing 2XA (on "Tel.").

SLF (Crafton, Penn.) reported hearing 8CB (on spark

and "Mod."), during May, 1920. His list is at 55, August, 1920.

The later list of the "Sleepless Wonder" (1TS), found at 55, August 1920, which records results obtained at Bristol, Conn., between May 18 and June 20, 1920, speaks of working 1AY, who used spark, Mod. c.w., and 'phone; and of hearing 2QR's spark, c.w., and 'phone signals.

Note that the Editor of QST had announced (at 48, February 1920) that he would be pleased to receive reports of amateur v.t. transmissions.

<sup>10</sup> 5 to 8, May 1920.

<sup>11</sup> 5, May 1920.

<sup>12</sup> 6, May 1920. The article added that only the Class II Marconi tubes were "now regularly available on the market for communication purposes."

<sup>13</sup> On March 9, 1920, 9ZN's 275-meter spark set was copied aboard a vessel lying in Colon, Panama. On March 12, 1920, the same ship heard him when 200 miles south of Balboa. See 8, May 1920. (Incidentally, the next day—March 13th—the vessel caught fire at sea and was destroyed. All hands were saved. See 8, May 1920.)

<sup>14</sup> 45, June 1920. The club is identified on 38, June 1920.

In the same issue, Traffic Manager J. O. Smith (2ZL) was equally vague as to how many stations were shifting over to tube sets, and where those stations were, although he said that a *trend* was developing:

... The long-heralded change from spark to continuous-wave transmission is now in full swing, and in quite a number of cases spark sets have already been discarded. . . .

Amateur radio is now in transition from spark to c.w., and a complete change-over is merely a question of time.<sup>16</sup> . . .

I wish I felt competent to make a fairly accurate estimate of how many amateurs were actively engaged in c.w. work, as of July 1, 1920, and concerning their geographical distribution; but I simply cannot do it. My best guess is, that as of that date, there were not over 200 v.t. transmitters in operation, in amateur stations, in the entire U. S. A.

This brings us to a study of the data published (in Volume III of *QST*) bearing on the number of licensed hams in the United States, and indicating their distribution throughout the nine Districts.

*The material is incomplete, and unanalyzed.* *QST* published lists of calls of new amateur stations, as follows: 42 to 43, November 1919; 10 to 14, December 1919; a separate supplement to the January, 1920, issue, containing 15 pages of call letters; 39 to 40, April 1920; 35 to 36, May 1920; 35 to 36, June 1920; and 41 to 42, July 1920. The January, 1920, supplement was a cumulative affair. Starting with it, and adding

further amateur calls published thereafter (and eliminating all calls published by way of correction), I get the following picture:

District	Total Licensed Amateur Stations Therein
First . . . . .	458
Second . . . . .	350
Third . . . . .	181
Ninth . . . . .	159
Eighth . . . . .	119
Sixth . . . . .	100
Fifth . . . . .	65
Seventh . . . . .	56
Fourth . . . . .	33
Total Licensed Amateur Stations in the 9 Districts . . . . .	1521

The main trouble with these data is that they give us no inkling of the dates as of which the various lists were accurate and complete.

Evidently, the Editor's idea was to devote two pages per issue to the publication of new calls, and to catch up as best he could, at this unchanging rate;<sup>17</sup> and I have now confirmed my suspicion that these lists were a good distance behind the actual march of events, as of (say) July 1, 1920. It is a pity that somebody like Edgar Felix did not get the correct and complete figures from government sources and analyze them for *QST*'s readers.

Mr. Entwistle presented some interesting facts re the number of licensed amateur stations in the First District in the June (1920) issue, at page 25. Just when he "put pen to paper" is not stated; but he said:

<sup>15</sup> Anybody who had the experience of working with one of the early "tube" sets will get a good laugh out of Stanley's description of his troubles.

Looking back at my log for July 21, 1920, I find that I first tried to operate a tube transmitter (built for me by the Atlantic Radio Co. of Boston, Mass.), on that date. All I accomplished was the burning-out of the plate-current meter, and the melting of the glass envelope on one of the four "VT-2" transmitting tubes.

After 1DH (E. W. Whittier, himself) had made some repairs, I got ½ amp. into my antenna, at Duxbury, Mass., on Saturday, August 7, 1920.

My first contact was a local — IRAA. I worked him on c.w. and buzzer-modulated c.w. on August 8, 1920. The "radiophone" part of my rig wouldn't work at all.

On Sunday, November 21, 1920, after more help from Whittier, and after I had moved my set back to Dorchester, Mass., I got 0.7 amp. into a big "cage" antenna, at my station (1AE), on 260 meters; and I worked 1PAI, and was heard by 1KAY, in Portland, Maine.

More changes, made mostly by 1DH (who worked for Atlantic Radio), followed. The first real traffic handling which I ever did, on c.w., was in the early hours of Sunday, December 26, 1920. Between 1:18 A.M. and 2:34 A.M., I sent 9 messages to 1TS (Bristol, Conn.), on 260 meters. 1ES kindly helped on the receiving work.

On January 27, 1921, I received written permission from H. C. Gawler, RI of the First District, to operate on c.w. at 325 meters, for 30 days, commencing February 15, 1921, to try to establish reliable communication with 2ZL. Some interesting results followed.

Mr. J. O. Smith (2ZL) really had a fine station. At 27, April 1921 (Volume IV), it was referred to as being probably the most powerful amateur c.w. station. See, also: editorial, "The Berries!" at 29, March 1921; and 48, May 1921. (Both in Volume IV.) Also, look at 13, April 1920; and 28, April 1920. (Both in Volume III.)

<sup>16</sup> 26, July 1920. The reports of the division managers

which follow Mr. Smith's general remarks (in that same issue) shed little light on the subject, either.

Entwistle (New England Division) made this statement (at 27, July 1920): ". . . One significant fact that stands out as inspiring is the gradual C-W-izing of New England. The following have c.w. sets: Wood, Arnold, Winchester; 1CK; 1XF, Providence; Mass. Radio School; 1YC; 1AY; 1QP."

The Northwestern Division Report (33, July 1920) includes these words by Acting-Manager Hertz: ". . . The tests conducted by 7CR, 7ZB and 7CW with the Forestry service radiotelephone sets have made us reluctant to hang up our 'phones. It is interesting to note that the c.w. radiating 0.46 ampere and spark signals radiating 1.5 to 2 amperes, both at Portland, are equal in audibility at 7CW, about 40 miles distant. . . ."

The Ontario Division Report (34, July 1920) states that there are presently four amateurs with c.w. sets in the City of Toronto, with others ready to build tube sets almost at once. The situation is described thus: ". . . A great transition seems to be taking place in the Toronto district. Everything seems to point to the fact that c.w. and radiotelephony are going to entirely replace spark telegraphy in this district with all advanced amateurs in the very near future. . . ."

The evidence, in other words, of an actual "shifting-over," was very indefinite, and very "thin."

Astute amateurs who had experienced the advantages of c.w. sets could confidently predict the end of spark transmitters; but nobody except a small group of "pioneers" had yet "gone over" to tube sets.

<sup>17</sup> See 39, April 1920: "Fellows, devoting a half dozen pages per issue to calls got to where it detracted from the reading value of *QST* and scared us. Then we hoped to publish monthly supplements carrying advertising to finance the thing, but the Post Office Dept. has just come out best in an argument on that. So we resume in *QST* — two pages a month until we get them all. You can cut out this sheet and keep it with the January supplement."

At the time of writing this report there are 1125 licensed amateur stations of the first and second class in the First Radio Inspection District with probably 90% of the total number of the former grade. Only one special amateur license has been issued, and that is located at Springfield, Mass. (Mr. Sabin). One additional school license has been issued, to Dartmouth College, call letters 1YB. The other technical school license was granted previously to the Rhode Island State College, call 1YA. Naturally the distribution of these stations varies from state to state and in different parts of the same state, *Greater Boston has the greatest density per capita; Wollaston, the most of any one city.* . . . [Italics by S. B. Y.]

Note that the number of licensed amateur stations in the First District alone, according to Mr. Entwistle, totaled 1125. His report probably was written sometime in May (1920), and possibly was written in April of that year. The time lag between the list of calls published in *QST* and the actual licensings of the stations themselves is strikingly illustrated, when this 1125 figure is compared to the 458 First District calls printed in *QST* up to and including the July (1920) issue, and when it is compared with the total of 1521 calls for the entire U. S. A., so published.<sup>18</sup>

It is interesting to see that the Fourth District still occupied the last position in total number of stations licensed.<sup>19</sup>

<sup>18</sup> Including the July (1920) list, at 41 to 42, July 1920, a grand total of 1521 U. S. A. calls and 58 Canadian calls had appeared in the *QST* lists.

The late Clinton B. DeSoto, at page 61 of *Two Hundred Meters and Down*, said: ". . . At the end of the fiscal year, June 30, 1920, the number of amateur stations had grown to 56 per cent of all stations licensed by the U. S. Government. The Department of Commerce reported that there were 5719 amateur stations, fifteen times as many as all other types of land stations put together. Although this was 370 fewer than in 1917 when all amateur stations were closed down, the disparagement was not due to decreased interest but to the fact that a number of amateurs were either still in the service or were fully occupied in commercial operating or manufacturing activities. . . ."

The best estimate which I was able to make, from the data in *QST* before I found this reference, was: 5000 amateurs as of July 1, 1920. I reached this by first multiplying 1521 by 2.45. (The "2.45" was obtained by dividing the First District "published" figure into Entwistle's First-District figure.) The multiplication gave 3726.45. To this, I added 1200 (my estimate of 2 months' new licensings), getting 4926.45. This I rounded off to 5000. Such are the "fruits" of incomplete figures.

<sup>19</sup> Look back at: 163, 185, July 1916; footnote 8, page 7, of my "Foreword to the Index to Volume I of *QST*"; 32, April 1917; and pages 11 to 12 of my "Foreword to the Index to Volume II of *QST*."

<sup>20</sup> The only amateur experimenters referred to, in *QST*, so far as I can see, were R. H. G. Mathews (9ZN), who was chief engineer of the Chicago Radio Laboratory, and some members of the Nola Radio Club, at New Orleans, La. See "The Underground Antenna Adapted to Amateur Waves," by Mathews, at 14 to 16, June 1920; and at 18 to 19, July 1920. The item re the Nola Radio Club is under "The Affiliated Clubs," at 45, June 1920.

The first reference to underground antennas for amateur use that I have found in *QST* appears in an advertisement of Chicago Radio Laboratory, at 41, August 1919. It points out the merits of an audio amplifier. This ad states: "Static elimination by use of the Rogers underground antennae is perhaps the most striking and far-reaching discovery made during the war. By this system 'static' is absolutely elimi-

As more and more stations came onto the air, the QRM problem became acute, especially around the larger cities.

In addition to the suggestion that tube transmitters be used in place of the "good old" spark sets — an impossibility until such time as power tubes and other essentials should become generally available to amateurs, and until decent c.w. receivers should be produced — two technological approaches were recommended. One of them was the use of highly-directional *underground* receiving antennas; and the other was the use of wavelengths *below 200 meters*, by low-powered spark transmitters.

As to the use of underground antennas, the literature is scanty. It is certain that only a very few amateurs actually experimented in this field. The need for elaborate shielding of all leads to the underground wires, and the necessity for employing elaborately-shielded receivers, or completely-screened receiving rooms, offered serious practical drawbacks. However, a handful of amateurs made the effort. They found some refuge from static, and verified the fact that *at short wavelengths*, underground antennas exhibited marked *directional* properties.<sup>20</sup>

— . . . —

Part II of W6CO's index to Volume III of *QST* will appear in our April issue. — Ed.

nated, the only atmospheric interference being due to ground strays. In cutting out the static, however, the signal strength on 200 meters is also reduced to about one-eighth of the value of the same signal on the ordinary antenna. In order to render ordinary signals readable on the underground antenna it is therefore necessary to use one or more steps of amplification. . . ."

Mathews had become acquainted with the work done by Rogers, and with the later experiments conducted by A. Hoyt Taylor (Lt. Commander, USNRF), through his (Mathews') association with the Great Lakes Radio Laboratory during World War One. See 30, November 1919. For Taylor's articles on short-wave and long-wave spark and undamped reception, with subterranean or submarine wires, see: "Short-Wave Reception and Transmission on Ground Wires (Subterranean and Submarine)", 7, *Proc. I.R.E.*, 337-361 (August, 1919); "Long-Wave Reception and the Elimination of Strays on Ground Wires (Subterranean and Submarine)", 7, *Proc. I.R.E.*, 559-583 (December, 1919); and "The Use of Ground Wires at Remote Control Stations," 8, *Proc. I.R.E.*, 171-190 (June, 1920). (The last of these 3 articles was written by Taylor and by A. Crossley, Lieut. (j.g.), USNRF.)

The best practical results had been obtained, in the Navy, in the reception of *long-wave* spark and undamped trans-Atlantic signals; and after April 7, 1918, all such reception, at the Belmar, N. J., station, had been conducted by the use of submarine wires, "balanced" against a "ground" wire, or against a loop antenna. See pages 570-572, Volume 7, *Proc. I.R.E.* (December, 1919).

Some success with the reception of ship-to-shore traffic on 600 meters had been demonstrated. See descriptions of "Remote-Control Stations" at Great Lakes, Hampton Roads, and New Orleans, at 175-189, 8, *Proc. I.R.E.* (June, 1920).

On the *transmitting* side, the best work had been between Great Lakes and Chicago, a distance of 36 miles. (See 7, *Proc. I.R.E.*, 360, August 1919). The first transmissions — about January, 1918 — had been on 340, 600, and 720 meters. (See 7, *Proc. I.R.E.*, 356). A few weeks later, 450 and 550 meters had been used. (See 7, *Proc. I.R.E.*, 357). At Chicago, Mr. A. L. Howard's receiving station had been utilized. (See 7, *Proc. I.R.E.*, 356).

# Strays

Recently W5TYM rounded up, from Hq. and other sources, background material for a ham radio story to be used in his company's house organ. There must have been some potent arguments there — John Wood of the public relations department is now WN5FLS!

— . . . —

On January 31st the Henry Radio Store, Butler, Mo., was broken into and the following equipment stolen: two Collins 75A-3s (serials 1573 and 1585), one Collins 32V-3 (serial 1489), one Elmac PMR-6A (serial 3096) and one Elmac PSR-12 (serial 554).

A reward will be paid by Robert Henry, owner of the store, to anyone giving information leading to the arrest and conviction of the person or persons participating in the crime. Compensation will also be made for the return of the equipment.

— . . . —

In recent measurements by the National Bureau of Standards the velocity of light has been redetermined. Using the molecular constants method, the new value obtained was  $299,792,000 \pm 6000$  meters per second; by the radio interferometer method, the new velocity value was  $299,795,100 \pm 3100$  meters per second.

— . . . —

We are saddened to report the passing of Theodore G. Deiler, Engineer-in-Charge of the FCC 8th Radio District. In 1919, Mr. Deiler began his career with the Radio Division of the Department of Commerce. While with that organization he became Supervisor of Radio at New Orleans, La. With the transfer of the Radio Division to the Federal Communications Commission, he was designated Inspector-in-Charge and later became Engineer-in-Charge.

Mr. Deiler was very well-known and respected in the radio industry and among amateurs. The thousands of commercial and amateur radio operators who were licensed under his supervision will mourn his passing.

Members of the Montreal Amateur Radio Club, sponsors of the 1954 W/VE Contest, attend presentation of trophies donated by Emerson Radio of Canada. The large cup is retained by the club; the miniature goes to Russ Wilson, VE6VK, winner of the contest. *Front row (l. to r.):* B. Halickman, VE2AKT; Ethel Pick, VE2HI; Alex Reid, VE2BE. ARRL Canadian Division director: R. Grant, VE2QQ, Emerson manager: H. Ward, VE2XZ, president of MARC; C. Lockhart, Emerson asst. manager; Gordy Webster, VE2BB, MARC contest chairman. *Back row:* R. W. Phillips, VE2EY; T. Lott, VE2AGF; D. Bromwich, VE2HY; J. Miller, VE2TA; H. Moray, VE2ZN.

There are many new amateurs in and around Davenport, Iowa, thanks to the Davenport Radio Club. W0HMM reports on a new series of classes sponsored by the DRAC incorporating the best training features of lectures, films, and experiments. After observing a few of the lectures, the faculty of St. Ambrose College volunteered full use of the college laboratory and projection rooms to the Davenport club, in recognition of their outstanding program.

Your club's educational program may be able to utilize the club code award shown. Any reasonable amount of these certificates will be forwarded to your group, for certifying both receiving and sending proficiency. The club code awards and a sample course outline can be obtained from the League's Communications Department.

— . . . —

Transient U. S. armed forces personnel in or near Southampton, England, are invited to attend meetings of the Southampton Group of the RSGB. The get-togethers take place on the first Saturday of each month at 1 Prospect Place, Southampton. Those interested should telephone either G3TR, 68839, or G3CCE, 22478.

# YL NEWS and VIEWS

BY ELEANOR WILSON,\* W1QON

AMONG our YLs there are some (too few, alas!) who are "dyed-in-the-wool" v.h.f. operators. They concentrate the bulk of their operating and experimenting on the higher frequencies — they do what they can to create activity and interest in the world above 50 Mc.

Liane Waite, W2FBZ, is another<sup>1</sup> YL who is so enthusiastic about v.h.f. operation that she is happy to do what she can to help swell the population in the upper segment of the ham bands. And, as W1HDQ has said, "this is the gal who has won several Northern New Jersey section awards in our v.h.f. contests, and has a few times posted the top score for the country."

In the Sept., 1953, V.H.F. Party, Liane followed in second place nationally another leading YL v.h.f. operator, W8BFQ. Referring to Margaret and Liane, W1HDQ wrote in *QST* for Jan., 1954: "... two topnotch v.h.f. YLs whose untiring efforts have earned them the respect of v.h.f. men everywhere." In the June, 1954, Party, Liane made the country's high score in the single-operator class.

Liane writes:

I have been licensed since 1951, starting in as a Novice. Unhappy with conditions on 80 c.w., I was instrumental in getting my husband (W2FBR) to build gear for 2-meter operation.

\*YL Editor, *QST*. Please send all contributions to W1QON's home address: 318 Fisher St., Walpole, Mass.

<sup>1</sup>See Apr., '53, department for information on other v.h.f. YLs.

W2FBZ

## COMING YL GET-TOGETHERS

April 23rd — W1 YLs, Sheraton Plaza Hotel, Boston. Write WITRE for details.  
May 20th-22nd — LARK Convention, W9 YLs, Allerton Hotel, Chicago. Write W9MYC.  
June 24th-27th — First YLRL International Convention, Hotel Miramar, Santa Monica, Calif. W6UHA, General Chairman.

We met a congenial group of local hams who were interested in higher frequencies, and I believe that, more than anything else, caused a continuation of interest in those bands, even after obtaining the General Class license. We became interested in contests, which I feel is one of the greatest ways for checking gear and promoting the building of new gear. Because of this, we got on 220 and 432 — at the same time we were on 6 and 2 meters. We are interested in 1215 and hope to be on that band by next spring.

There is quite a challenge to me in operating frequencies where it is possible to accomplish something that has not been done before. We are interested in carrying on any v.h.f. schedules which would be desirable to set up, and we have two goals. One of them is to work Florida on 2 meters; the other is to work England.

May Liane soon realize both goals, and may her words encourage more YLs to take to the higher frequencies.

## Reminder!

YLs and OMs — don't forget your date to meet in the Sixth Annual YL-OM Contest on March 5th-6th and 19th-20th. Complete details were on page 49, February *QST*.

And speaking of OMs — we are encouraged and perhaps a bit flattered to realize how much mail for his department comes from them. The proverbial "battle of the sexes" seems nonexistent in our hobby; rather, the spirit is one of mutual respect, enthusiasm, and cooperation. We're always pleased to hear from OM readers and hope that their interest in the distaff side will continue!

## Keeping Up with the Girls

W5TTU, YLRL 5th District chairman, reports the organization of the Texas YL Round-up Net which meets Thursdays at 0930 CST, 3880 kc. W5WXY, Bernice, is NCS with W5ZTB as alternate. Pat also observes that the Southern Belle Net has changed its meeting time to 0830 CST (3920 kc., Fridays). . . . New members K6s AYJ E1I, KN6s EXQ EXV GRA GQW IDL IHD, W6s HVC QGC QOO TMB bring the Los Angeles YLRC membership up to 55. For the club's annual Christmas party, W6QGX, Harriette, trimmed a tree with small pieces of radio components and topped it with a miniature 16-element 2-meter beam designed by KN6GMX, Jayne. At the January

(Continued on page 148)

WITRE, Barbara Harrington, of Topsfield, Mass., turned in the highest claimed "phone score in the Eastern Mass. section during the 1954 Sweepstakes. Licensed in 1951, Barbara has been on one band or another ever since. Currently she operates 10, 15, 20, 40 and 75, with 20 her favorite band. Holder of a "phone WAC certificate, she has worked 78 countries with 56 confirmed. She is alternate net control with W6UHA of the 20-meter YLRL net. A registered nurse, she is the XYL of W1JEL and the mother of two daughters, 5 and 7, both of whom are working at learning the code.

CONDUCTED BY EDWARD P. TILTON, WIHDQ

**A**LONG about the last week in January each year you can measure v.h.f. activity with a ruler — a ruler alongside the logs mailed in to Headquarters following the Annual V.H.F. Sweepstakes. Time was when a pile an inch high looked big for a v.h.f. contest. But you need the better part of a one-foot scale for the eighth running of this popular event, January 8th and 9th.

When you look through the comments accompanying the entries, you find things like "Never heard so many signals in my life" — "Activity here was at an all-time high" — "Had to peel the signals off in layers" — "New contacts were made right up to the last minute!" Nobody reported conditions as being good, but there seems little doubt that the 1955 event will break all previous records for v.h.f. contests.

At least a dozen participants reported more than 200 contacts each, K2CMB/2 leading with 248. W2TBD made 225 contacts on 144 Mc. alone. The country's top score, so far, is W2UK's 6336 points, made possible through the amazing total of 18 ARRL sections worked on 144 Mc.! Last year's record score of 3952 points, by W1RFU, was topped by at least 8 contestants, with W2RGV, W1UIZ/1 and W1RFU all over 5500 points.

Club records seemed sure to fall, though the big-club totals have not been checked as we write. The South Jersey Radio Association seem to have maintained their near-monopoly on V.H.F. SS gavel awards, their claimed total for 1955 running over the 50,000-point mark. Their perennial competitors, the York Road Radio Club, from just across the Delaware River, outdid their previous efforts, and it looks like a close one between these two rivals. Several smaller clubs posted totals that would have been good for top place a few years back, and the num-

ber of clubs participating was well up over previous years.

Propagation appeared close to the winter average, from your conductor's vantage point. This would have meant a quiet Sunday afternoon and evening in years past, as the field would have been pretty thoroughly covered by noon of the second day. But not in 1955. The 2-meter band, particularly, was jumping with activity, right down to the last minute. There was never an hour, including those just before dawn on Sunday morning, when it was not possible to make hay in this contest. In many areas you no longer post a winning total and get anything like a normal night's rest in a V.H.F. SS week end!

Through the Middle West many operators reported conditions the worst they'd seen all winter. Particularly west of the Mississippi, contacts were made only over short distances. But still we find reports coming in, in better than former numbers, from most of this territory. Far-western v.h.f. men, too, report the going rough, but there are some good W6 and W7 logs coming in, with the deadline for their mail still a few days away as we write.

There was heartening evidence of new v.h.f. activity in many quarters. They won't hit a high spot in the national scoring, because of their lack of point-building section multipliers, but the Albuquerque V.H.F. Club came through with 20 logs. A goodly number of reports came from North Carolina groups, whose principal complaint was that stations they should have been able to work in Virginia and farther north didn't turn their beams around to the south often enough.

Checking a contest of this magnitude is not done in an idle hour; it will be some time before the final results are known. But one thing is sure:

One of the more popular items of v.h.f. gear described in *QST* in the past year was the "One-Package 2-Meter Station" by W1VLI. In the April, 1954, issue. These pictures show an adaptation of the design by W2NGN, who followed the original closely circuitwise but modified the layout to fit a more commonly-available case.

The 8th V.H.F. Sweepstakes provided a week end of competition that will not soon be forgotten.

### Here and There on the V.H.F. Bands

More on the Sept. 18th fireball: In December QST, page 68, we reported strange doings on 144 Mc. that appeared to tie in with the appearance of a fireball in western skies the night of Sept. 18th. At that time we knew that W0TJF had heard W5VWU, and that several New Mexico stations had heard unidentified DX, apparently reflected from the region around the fiery visitor. In response to our request for information on any other reception of this sort, W0VEC, Lincoln, Nebr., sends us the following:

At about 2130 CST, W0VEC heard a c.w. station on 144 Mc. say, "— SO G A W?FAG DE W7VMP". Undoubtedly, the station being worked was W5FAG. At 2143, W5VWU was heard by W0VEC and called, following reception of his CQ. The signal had risen to a peak of S8 to 9, in a series of bouncing fades, and it faded out in the same way. The entire period of reception was about 30 seconds. The W7VMP signal was steadier, about S1.

The 2-meter reports from various parties appear to span a period of half an hour or more, yet reports of the fireball's appearance relate to only a few minutes, at the most. It appears possible that the reception reports resulted from a fairly general meteor shower, of which the fireball may have been merely one spectacular part. We suspect that quite a bit more of this sort of thing would be observed, if 2-meter activity were maintained regularly on the scale that prevails during a v.h.f. contest week end.

Here's a fellow who really has had antenna trouble! W4CVQ, Raleigh, N. C., had just put up 24 elements each for 220 and 144, when Ilurricane Ilael dropped a tree across his guy wires. All antennas, including a 6-meter beam, a "d.e.-band long wire," and the above, toppled 110 feet to the ground. Next, a 32-element 144-Mc. beam was erected, and seven days later a turkey flew into it. (Jake says the array looked as if the invader was a bomber!) The latest in the line of 2-meter beams is a 24-element, W2NLY-style collinear, horizontal. It works out better than the 32-element for Jake's requirements, as it is less critical as to direction.

This can be important in an area where much searching of the band is required, and this certainly applies to North Carolina, though things are looking up there on 2. The V.H.F. SS file contains quite a batch of logs from North Carolina entrants, for the first time. Several of the boys complain that they couldn't work out of the state because the stations to the north didn't turn their beams down that way often enough.

W4CVQ is another of those fellows who is working miracles with 826s. His pair run very easily at 500 watts input on voice, and have been pushed to 800 watts input without undue heating.

W4DWU, Falls Church, Va., thinks that all 2-meter men must use old call books. He was formerly located in St. Petersburg, Fla., and he still has to spend quite a bit of time disillusioning excited 2-meter ops who think they have just snagged a Florida station.

How consistent is communication over a 450-mile path on 144 Mc.? Some idea can be gained from results between W8BFQ and W1HDQ. Both stations have good locations, but the terrain in between is very rough, all the way. In the period between October 25th and the end of the year, a schedule kept at 1715 EST produced identifiable signals each way on 24 tries. This figures out to quite a bit better than half the time, when equipment troubles and inability of one or the other to keep the skeds are included. Tests consisted of only two minutes of transmission each way. Experience the previous winter, and through last spring, indicated that when 5-minute transmissions were made by W8BFQ, at least some recognizable signal could be heard by your conductor just about *every* try. Similar results, or better, have been achieved in nearly all parts of the country, and over paths that appear even more formidable than the one between West Richfield, Ohio, and Canton, Conn.

There is increasing interest in extended-range tests in many quarters, as word gets around that hops of several hundred miles can be worked regularly on 144 Mc.—if sufficiently good equipment and antennas are used. W5FAG, Albuquerque, N. Mex., is making nightly tests with W6WSQ, W6NIZ, and W7LEE at 2200 MST. Hub has a low-noise converter and a selective i.f. system. His antenna

is a 16-element array, but a 64-element job is nearing completion, as is a 1-kw. final stage. Activity and equipment on 432 Mc. are improving, also. W5S NSJ EDK FJE and FAG all have crystal-controlled gear and low-noise converters on that band, too.

W5VWU, formerly of Albuquerque, has moved to Florida, taking with him a 1-kw. final and all the other gear needed to do outstanding work on 144 Mc. We may get that Florida activity yet — if John doesn't let that climate get him down too soon. Another prospect for 2-meter DX tests: W7LHL, Seattle, Wash., is making a winter project of the construction of a high-powered final stage and a big horizontal beam.

As 2-meter activity becomes more universal around the country, a closer tie-in between v.h.f. men and the ARRL field organization might well be made a major objective of SCMs and other ARRL officials. One way that this aim can be served is to arrange for more frequent and widespread transmission of ARRL Official Bulletins on the v.h.f. bands. W9USI, Wilmette, Ill., transmits bulletins on 144 Mc. as regularly as possible at 1930 CST nightly. He runs through

(Continued on page 144)

CONDUCTED BY ROD NEWKIRK,\* W9BRD/9

## Who:

Well, the first half of the 21st ARRL International DX Competition now is history. How're you doing? Hah, if you think *you* goofed, here follow some early and tragic DX Test flashes from around the country. For your 1955 All-American All-Call-Area All-Star DX Test line-up, Jeeves nominates:

W1 —, *Orson A. Roundlot*, whose imagination was working so well that every number he heard was meant for him. So far, best score he ever (thought he) made.

W2 —, *Zeke N. Peck*, an expert touch-typist, who kept his entire log on a mill but didn't notice the ribbon break during the first hour.

W3 —, *Watkins D. Matterby*, who spent the whole first Test week end tearing apart his factory-built kw. Then found it had stopped working because the XYL had kicked out the wall plug while dusting.

W4 —, *Warren N. Beetup*, whose beam rotator froze in the southeast quadrant as the Test began. Came out of the first week end with 638 KP4s.

W5 —, *Hugh R. Buggybud*, who got panicky and signed W4—/5 instead of W5—/4. Must work his 293 contacts all over again to correct the mistake.

W6 —, *Don B. Sophani*, who ran out of logsheets and scrap paper early in the Test. Used his tool-chest stock of sandpaper as an emergency measure and wore out 35 ball-point pens.

W7 —, *Wayne E. Wether*, who didn't get out worth a dern after he complained bitterly to the power company about an annoying power leak. They licked it by dropping his line level to 37 volts.

W8 —, *Willie Everbreath*, who sought to cash in on 1.8-Me. multipliers and rushed out to erect a long-wire with a spool of No. 8 Copperweld. Got it unwound, all right, but it sprang back into a roll from which he was finally extricated eighteen hours later.

W9 —, *Otis S. Terrybell*, who invited 147 friends and neighbors over on the week end preceding the Test, thereby assuring subsequent peace and quiet for an all-out effort. As the party guests arrived, found he had misread his calendar — that was the Test week end.

W0 —, *Prettywell Schott*, who swapped his smooth triple-conversion superhet for a nifty 5-element rotary in the interests of a higher score this year. Sat down to make a killing as the Test began, then committed suicide; no receiver.

Our K, VE and VO friends were having their problems, too, but the foregoing brief grief accounts should suffice. No one need despair, though, for the last portion of the Test is still to come. Plenty of time to boost that tally — good fishin'!

## What:

Or should we have said good *fission*? That's just about what it takes to crack through the Test pile-ups around some of those gaudy numbers leaking through. We'll save a line or two this month by being a bit arbitrary, using Greenwich Time exclusively. And so to press . . .

Twenty 'phone, first off. W9RBI caught up with CR7CF (14,105) 19, GC6FQ (157) 15, HC8GI (159) 23 on Gala-

pagos, HK0AI (205) 16 of San Andres, M1B (114) 15, VQ8AR (146) 18, VS2DQ (195) 14 and 3V8BP (158) 16-17 . . . EL9A (325) 21, ET3Q (325) 17, MD5FA (185) 9 of Suez, MP4KAC (185) 14 and ZD3BFC (115) 21 hooked up with CNSIE . . . W9WHM collected EA8AI, KA0IJ (285) 22, TF5SV (110) 16, VQs 4RF 5EK (150) 21 and a ZD3, FB8BL (91) 21 and ZD2DCP (140) 21 were gottaways . . . That Iwo item, KAs 3RR and SSC worked W6UED, while W4BYJ settled for SP2AA and an HK0 . . . SWL S. Tonsi, Wisconsin, heard the boys grappling for ET2US (190), FM7WN (160) 18, KAs 21M (140), 8FC (198), OQ5s EC (125), FO (100), VP5 2KM (162) 17-18, 7NG (200), VQ2DT (141) and 5A4TL (130) . . . "200" DX Club sleuths tracked down ACs 3PT (190) 16, 4LM (270), 4NC (103) 12, CR8AB (170) 18, LZ1KAA (128) 14, MP4QAH (100) 13-14, OY2A (142), UB5KBE (100-150), VK1PG (132) 15, VP8AQ (118) 0, VU2AK (160) 14, YI2AI (110) 14, YJ1AA due back on soon, ZC3AC (163) 10-14, ZDs 2RWV (198) 19-20, 9AB (170) 23, 9AC (130) 20, ZSs 2MH (90-110) of Marion Isle, and 8I (345) 17-18 . . . Northern and Southern California DX Clubs cornered CR6s AT (121) 21, BX (143) 20-21, FB8BC (170) 5, FY7s YE (220-289) 17, YZ (125-185), GC2FZC (200) 16, HA5KBA (157) 15, KB6AQ (230) 19, SV1AZ (98) 17 of Crete, VK1DY (94) 8, VQ8CB (100) 15 of the Chagos, VSs 1FS (199) 14, 411K (30-200) 10, 5KU (25) 12-16 and ZD6BX (68) 17 . . . West Gulf DX Club's *DX Bulletin* calls attention to 14-Me. radiotelephones CN2AD (220) 9, CRs 6AC 22, 6CK (155) 21, 7AU (190) 21, 7CZ (139) 21, 8AC 8SA (53), 10AA, DU7SV (94) 7, EAs 9BC (129) 14-15, 9DF (187) 19 of Rio de Oro, 0AC (195) 9, EL2X (337) 18, FB8s BB (143) 22, BN (109-197) 19, BP (115-195) 18, XX, FF8BB (146), FL8AI (150) 18, FQ8AK (125) 21, FY7YA, 11B1MX/HE (101) 15, HZs 1AB (150) 14, 2AEH (105) 15, KTIWX (175) 14, MP4s BBL (70) 14-15, QAD 16-18, OK1MB (109-348) 15-20, PX1YR (130) 21, SP9s KAB (195) 15, KAD (138) 16, UB5KAB (132) 13, BKs 1AC (145) 8, 9RII (118-145) 5-7, VP5s 1GG (169) 2, 2DA (106) 22, 2KM (140) 17-18, 3YG (135) 22-23, 5AE (147) 19 of Turks, 8AO (158) 5, VQs 3RJJB (142) 21, 6LQ (119) 21, 8AL (115) 18, imminent VQ9NZK, VRs 4AE (180) 8, 3A, VS4BG 14, VU2AL, YN4CB (186) 22-23, YU1s AD (140) 14-15, GAI (105) 16, ZD8AA, ZM6AT (160), ZSs 3AH (130) 15, 7C (167) 21, 7D (125) 19-20, 9G (165), 3V8BL

\*New Mailing Address: Effective immediately, please mail all reports of DX activity to DX Editor Newkirk's new address: 4128 North Tripp Ave., Chicago 41, Illinois.

One of Portugal's outstanding DX enthusiasts, CT1CB runs 250 watts to the VFO rig at left, likes his S-40 inbaler and loads up a 20-meter half-wave skywire. A picture of the Portuguese Indian station of CR8AB, CT1CB's son, appeared last month.

Madagascar now sprouts hams by the dozens where formerly they were rarities. F88BC often can be found on 15, 20 and 40 meters running 25 watts of 'phone to a VFO-807 ensemble. His favorite time for W/K-hunting is 1700-1900 GMT. (Photo via W9RBI and ZS6BW)

XG6A, a cutie giving QTH as Gulf of Mexico's Guanto Island, regaled many of the gang around 14,013 kc. . . . . W1OJR went at it hammer and tong, landing stuff like CR7s AD (75) 20, AF (55) 19, MB (22) 17, CT3AB (90) 20, EA8s 8BM (22) 18, 9AP (20) 18-19, an ET3, an FPs, FM7WP (25) 13, HP2TP (95) 16, OQ5LL (60) 21, SP3PK (10) 15, an Antarctica VK1, VQs 3FN (35) 18, 4FG (25) 18, 4FK (15) 20, ZEs 3JL (19) 18, 3JP (63) 20, 4JE (65) 19, ZS3HX (52) 17 and 9S4BS (38) 17, HC4MK (90) 23 and HK4BD also came back but weirdies WA1AB and CU3YY escaped Vic's net. . . . . The cream of W4TFB's bumper 14-Mc. c.w. crop are DU7SV 23, EA9DF 23, GC2FZC (65) 15-16, H18WA (24) an HK0, I1BFL (42) 15-16 of Trieste, JAs 1AQ 0, 3AB 23, LZ1KAB 21, OD5LC 18, ST2AC (37) 19-21, VQ2AS (65) 21, VR2BZ (56-70), YO3GY 18 and ZC4IP 16. Don's ill luck included EA8AX (50) 21, FM7WD, MP4QAH (40-72) 15, OX3UD (40) 17, SW0WY, a VQ6 and ZS7D (28) 19-20. . . . . W6QPM reached 126 by way of FO8AX, FY7YE (35) 13, GD3IBQ (70) 16, HA5KBA (85) 13-14, ISSV (47) 16, OY4XX (30) 16, VQ4RF and ZE5JJ. . . . . ET3Q (50) 20, Turks' VP5AE and 4X4DK (100) 15 enraptured W9KXK. . . . . W4YZC made off with CR6AI (21) 18, EL2X, KA2CR, PJ2AJ and a ZD6 thanks to his new 3-cl. whirler. . . . . Two fixed elements are enough for W3UXX to bag CR7LU (30) 20, a GD3, HR2AD, KG4AN, ST2NG, TI2RI, VQ2IM, ZE3JP (14) 9, ZS3K and 5AITC (46) 19. . . . . W2WZ fancied FO8AG (23) 21, LZ1KAA (41) 13-14, MP4s BBE

(77) 13, BBL (75) 13-14, VU2AL (55) 13 and 4S7LB (47) 14. . . . . JAs 1SR 3CS 7AD 8BL 0AA (not Iwo), KAs 2CG 2GC 8SE and KX6NA (134) hit the spot with W7PUA. . . . . A DXamination of doings here and there, at W7WAT: EL2P (45) 13, an ET3, FM7WM, W2GVZ: a DU7, a ZA1, W3WPG: CN8FQ, W6BIL: an ST2, a ZB2, W6SGF: FO8AC, JA3AB, KA2USA. BS 4-5, TI2BX, W7RVD: JAs 1N1 1XR 2LC 3BK 5CP 8AA 0BR, that KD6AT, KR6s KS OY, OQ5PU (25) 20, W3DLZ: one FG7XE (20), OD5LJ (25) 14-15, ZE6JF (23), ZS7D (27) 19-20. W0PWN: HR1JZ, W0VFM: FAs 8RJ (28) 14-15, 9VN (76) 20, VP3VN (54) 14. . . . . CE0AD (22), CR5JR (40), HH3DL (36), HR1MC (32), LU "Z" boys 2ZC (28), 7ZM (40), 7ZO (82), TA3US (38) and VP8AZ (20) answered W4ZAE. AP2R slipped Mick's hook. . . . . I1BNU/Trieste (35) 16, SP9KAD (40) 15 and ZB1JRK (17) 20 are among the many goodies spotted by San Diego DX Club stalkers. . . . . SCDXC's Bulletin and NCDXC's DXer specify 14-Mc. code catches EA8 9AR (55) 18, 0AB (12) 9, ET3AB (53) 15, FB8s BC (65) 18, BK (90) 0, XX (40) 13, ZZ (40) 15, GC8NO (53) 17, HE9LAA (64) 16, HZ1s AB (94) 15-16, HZ (53) 16-17, KP6AK, LX1AC (31) 15, LZ1KSP (73) 15-16, MIL (72) 15-16, OQ0DZ (28) 18, VK1PG (65) 8, VQ8CB (50) 19, VSs 4HK (35-160), 5KU (24-60) 20, ZB1s BF (22), BU (65) 15-16, CO (17) 15, ZD6RD (52) 17, ZSs 2M1 (150) of Marion, 3B 20 and 9S4AX (50) 15. . . . . WGDXC's DX Bulletin spotlights CRs 5AD (25) 20, 6CU (1) 21, 8SA (53), CS3AC (90) 16, CT2AF (58) 22, FB8s BL (83) 20, BR (25) 17-19, FE8AE, FK8s AO (88) 21, AP (30) 14, FO8s AB (80) 4, AK (65) 4, FR7ZA (18) 18, HA5s KBA (85) 13-14, KBN (68) 14, HV1OR, HZ2AEH, KC6GZ (80) 22, KJ6AZ (93) 23-0, KH6OR/KM6, LZ1KPZ (49) 14, OD5AX (69) 14, OQ5HI (60) 18, OYs 2Z (53) 13-23, 3GA (81) 15, SP3s AK (29) 14, AN (50) 14, PK (41) 15-16, SV7AZ (80) 13, UA1DH (62) 14-15, VQs 2DR (17) 19-20, 2GW (40), 2W (90) 22, 21, 3BM (78) 19, 5EK (69) 19, VR2CG (52) 16, VU2EJ (52) 14, YI2AM (60) 14, YO3RD (12-28) 15, ZB1AU (50) 13, ZC5SG (50), ZE4JE (3) 18-19, 5JE (62) 19, ZP9AY (50) 13, 3V8AN (25-45) 13 and hopeful ZD8AA of Ascension.

Forty is sporty, especially from the c.w. angle. K6EC put the bite on CN8GB (15) 22, CR9AF (22) 16, KG4AE (12) 2, KR6KS (17), VP8BD (24) 2 and VS6DD (15) 8. Ev also encountered characters A11BC (21), JK2OR (29) and KD6AT. . . . . EA8BF (40), ET2FQ (18), FG7XB (23) 12, LZ1KAB (25), TG9MB (22), VP8AO (12) and YS10 (8) contacted, or were heard by, W4ZAE. . . . . A 7-Mc. QSL from VK5LF/MM, QTH off the South Australian coast, confirmed that he used a 5-watt 25L6 rig when working W2OBX. . . . . W4TFB worked CN8GB 6, FAs DA6, RJ0, ZZ7, I1BNU/Trieste 3, KG6CX 10, LU "Z" brethren 1ZT 2ZC 2ZI 4ZB 8ZO 8ZS 9ZM and a healthy helping of VP8s. . . . . CRs 4AL (10) 3, 7CD (6) 4, 7CI (27) 3, EL2s C (12) 22, X (12) 22, HK0AI (7) 4, LZ1KSI (18) 8, TF5TP (10) 0, TG9LM (7) 0, VQ4EZ (13) 11, ZC4PB (18) 22, ZS7D (13) 21 and 3V8ES (11) 21 swapped 73 with W4YIH. Jim also heard, or heard about, 7-Mc. possibilities UA2AC, VQ4BNU, VS6CG

(29), **VK9RH** of Norfolk, **ZAs** **1KAB 4KBA** (9) and **4S7NG** (25) . . . . . **W7JLU** did fine with **JZ0DN** (12) on Biak Isle, **KC6CG** (30), **KG6IG** of the Volcanoes (25) and **VK9AU** (40). **UA0s** **KFA** and **KJA** (28) wouldn't come back . . . . . **WN3ZOG** managed nice Novice-style **DX** in snagging **CN8MM** (190) 0. Any other Novices working Africa on 40? . . . . . **CE3DZ**, **HH2LR**, **TF3MB**, **JAs** **1AFF 1KM 2LC 3JA 3LK 5AA** and many Europeans **QSOd W6RZS's** 813 . . . . . 40-meter frolicking hither and yon, at **W1WAI**: **HC1LE** (25) 12. **K2ALA**: **CT3AB**, **EA6AE**, **TF3AB**, **VP7NG**, a Trieste II. **W3WPG**: **EA9DF**, **HA5KBA**, **OE5AH**, **ST2AR**. **W4WR Y**: an **FG7**. **W4 YZC**: **EA0AC**, **HR1JZ** (20) 3-4 **W5CAT**: **DU7SV** (20) 9, an **HK0**, **OK1MB**. **W7UKA**: a **DU**, **JAs** **1EA** (6), **2BL** (2), **3JA** (6) . . . . . 7-Mc. c.w. club surveillance, by **WGDNC**: **OX3AY** (28) 2-3, **ZS3HX** (20) 4. **SCDXC**: **FB8ZZ** (20) 7, **VK1s** **EG** (20) 7 and **DY** (20) 7.

Forty 'phone, courtesy **NNRC** digging: **CR6BC**, **CT2AG**, **EA6BK**, **HI6TC**, **HR1FM**, **JAs** **AEA AGU**, **KG6GX**, **KJ6AZ**, **TG9s** **LR VS**, **VK9s** **FM OK RC RM**, **VPs** **1RS 2GW** and **VS2CP**. Definitely a band that separates the men from the boys!

Eighty c.w. came into its own of late and no mistake. Though spotty at times, the north Atlantic path treated the whole U. S. A. to Europeans by the logflus, **FA8DA** (10), **KL7s** **APZ** (9), **AWB** (10), **FAJ** (8), **KM6AX** (32), **OKs** **1DE** (9) and **2KSV** (9) fell prey to **W9GVZ** at **W9AVJ**. **G2PU** around 3800 kc. had a stand-out 'phone signal . . . . . The better items at **K2BZT** include **CT2BO** (10) 1, **HA5KBA** (3) 5, **LA2HE** (10) 6, **OE2JG** (7) 4, **OKs** **1MB 1KTW 3AL** and **9S4AX** (3) 1. Hayden also riddled five Swedes, eight Germans and 14 Britons . . . . . **EL2X** made the long hop into the ledger of **W7JLU** on 3510 kc. **VK5KO** also nabbed the Oregonian . . . . . **W4YZC** captured **GD3UB**, **OK1s** **KBW KTI**, **YV5BJ**, many **Gs** and a **9S4** . . . . . A **CT2**, **OZ4X** and **TI2BX** (6) 1 will **QSL W1WAI** . . . . . **W9UDK** bagged an **EL**, **KL7PI**, **OX3AY** and many Europeans with his 12-foot-high window. George also was among the unlucky ones to catch the phoney 3.5-Mc. **FG7XB** . . . . . Jeeves' recent misinterpretation of **W2ESO's** report, switching Gene's heard and worked items, was not in the nature of a base canard. **OE3SE** was a new number on 3.5 Mc. for **W2ESO** . . . . . **W2QHH** made off with **HB1MX/HE**, a **KM6** and **ZK1BG**, all lovely 80-meter munchings . . . . . The **DX Bulletin** adds **EA9AP** (14) 0, **FA9VN** (13) 6, **HB1HQ/HE** (20) 7, **ZS3K** (12) 5 and **4X4GB** (1) 2 to the 3.5-Mc. stew.

Fifteen 'phone continues its able role as a substitute for old friend ten during the latter's m.u.f. vacation. **W9RBI** took a liking to 21 Mc. after sessions with **FB8BC** (220) 18, **KW6BB** (270) 22-23, **VQ2FV** (220) 18, **YU1GM** (255) 17, **ZB1AUV** (170) 19, **ZSs** **7C** (150) 17, **9I** (240) 16 and **4X4DX** (15). Ross advises that **VP5AE** of Turks has rocks on 21,140, -180, -200, -220 and -310 kc., **A3** . . . . . **W1CTW** has 61 countries on 15-meter c.w. but still seeks his first Asian **QSO** in 30 years. The **ARRL DX Test** now in progress ought to do it! . . . . . **KA2KC** and **KJ6AZ** bounced back to **W6UED**; **KC6AA** and **TI2BX** likewise to **W6SGF**, all **A3** . . . . . **W6ZZ** made it 67 on

## CAUTION

Under this country's treaty obligations and on formal notice received from other nations, FCC-licensed amateurs are warned to engage in no communications with stations in the countries listed below. This is in accordance with FCC Public Notice of December 21, 1950 (p. 23, Feb., 1951 *QST*), and as since revised.

*French Indo-China* (Cambodia, Laos and Viet-Nam), *Republic of Indonesia*, *Iran*, *Korea*, *Thailand*.

Prefixes to be avoided: *FI8-XI's*-3W's, *PK* (Netherlands territories excepted), *EP-EQ*, *HL* and *HS*.

21 Mc. via **ZM6AR**. Miles also grabbed **KA2KS**, **KV4BD**, **VP6GT**, some **ZLs** and **ZS3AB** . . . . . From **W8YIN** we hear of **CR6BH** (225) 18-19, **VQ2AW** (165) 20 and **ZD6BX** (50) 19 . . . . . **NNRC's** most recent roster of 15-meter 'phones: **CN8s** **MF MM**, **DU7SV**, **ELs** **2X 10A**, **FA3JY**, **OE1USA**, **OQ5s** **BI GU**, **VP3YG**, **VQs** **2ST 3CB 4BF 5CJ**, **ZC4JA**, **ZD9AD**, **ZE2JK**, **ZSs** **3AB 3BC 7G** and **4X4BG** . . . . . **WGDNC** found **FY7YC** (40) 19-20 and **ZE5JJ** (30) 20 using c.w.

One-sixty c.w. grudgingly gave ground under persistent onslaughts. **W1BB** and **W9PNE** reached 28 and 17 countries worked on Low Band, respectively. Several hands were out after their last continents for 1.8-Mc. **WACs** but the going was rough. This **DX** is being worked or heard by **W/K/VE/YO** participants: **G2s** **AJ HX PL**, **G3s** **ABM AJZ BKF BRU ERN EHV GGN GIO HDZ HIS HKQ HRW IGT JDK JED JEJ JZJ JOJ JVL PU QD**, **G5s** **JU R1 VB**, **G6s** **GM LB PD**, **GD3FBS**, **G13s** **HCG IVJ**, **GMs** **2BUD 3HRZ**, **GW2INO**, **EI9J**, **HB9CM**, **KP4s** **CC DV KD**, **KV4s** **AA BB**, **LU3EL**, **OK1s** **III KTI**, **TI2BX**, **VP7s** **NG NM**, **YV5DE**, **ZC4GF** and **ZL3RB** . . . . . **W9PNE** writes: "Very anxious for Asian **QSOs**. **DX** must stay below 1835 kc. to be readable here. Best frequencies are 1826 to 1831 kc., and 1870 to 1875 for those who can operate outside the U. S. A. band." . . . . . By next month's deadline the dust should be settling after completion of both the 160-meter Transatlantic Tests and the 21st **ARRL International DX Competition**. Scribes **W1BB**, **W3RGQ** and **W9PNE** undoubtedly will fill us in on further 1.8-Mc. developments. Until then we'd better make the most of what's left of this sunspot minimum and squeeze the last **DX** drops out of old 160. Good luck!

## Where:

Guadeloupe **QSL** info courtesy **W4LYV**: Cards should be sent directly to **FG7XA** and **FG7XB**. If you desire your return **QSL** to arrive direct, send a stamped self-addressed envelope to **W4LYV** at Box 104, Miami; otherwise they'll reach you via bureaus . . . . . **W4LYV** also notifies that he's closing out his duties as **VP5BF** (Caicos) **QSL** secretary. The **VP5** now is believed to be Jamaica-stationed. Over

W0YDZ, who made his "How's" photographic debut last month, has this exotic W0YDZ/KC6 layout perking on Guam. A 5-element 14-Mc. rotary appears at left; the lethal-looking object at right is a 10-element 10-meter job.

4000 VP5BF Caicos cards have been distributed; if you still have one coming, ship that stamped self-addressed envelope to W4LVV ----- VP5AE, of Grand Turks, desires similarly-prepared envelopes from those who wish direct QSLs: Maj. D. E. Evelyn, PAA, Grand Turks Island via Patrick AFB, Fla. Otherwise, QSL via WSLMO and await your confirmation via the bureau route ----- "Still awaiting permanent quarters so I haven't yet unpacked. Expect to be settled shortly and hope to be on the air thereafter." So writes W4VE, ex-KA9AA-KR6AA, who expects QSL inquiries at the address to follow — full QSO data necessary ----- W1s ARR CTW MX OJR SSZ UED WAI WPO ZDP, W2s OLU WZ, K2BZT, W4s TFB YIID YZC, W6s SGF UED ZZ, K6EC, W7JLU, W8YIN, W9s AVJ CFT EU GVZ RBI RTY, CN8IE, PJ2CJ, NCDXC, NNRC, OVSF, SCDXC and 200-DXC got the goods on:

Ferreira, P. O. Box 586, Windhoek, S. W. Afr. ----- 4X4FW (QSL via IARC) ----- ex-5A2CE, L/Cpl. Baker, 9 Med. Wireless Tp., MELF 12, Middle East ----- ex-5A2CH, 139 Rectory Rd. Gp., Essex, England.

## Whence:

Asia — JA1CV raps out a DX column for Japan's *Radio Experimenter* and regularly schedules K6DV. Kazu runs 100 watts to a five-stage VFO-807s arrangement on 10 through 40 meters, receiving with a homebrew 10-tube ----- British authorities continue attempts to obtain ex-AC4RF's release from a China mainland prison ----- WGDXC Asian tidbits: HZ2AEH gets around with a BC-610, 51J and 3-element spinner. W1JRA is confident of obtaining a permit for hamming in Afghanistan. VU2JP does QSL chores for ACs 3PT 3SZ 4NC and has Sunday 0500 GMT skeeds with the latter. VS1GH (ex-GM3AVO) occasionally visits Labuan and Nicolbar. EP3SS has hopes for early relaxation of Iranian ham radio prohibition ----- KD6AT's bearing appears to be Korea; too bad.

Africa — "I hope to go on a DXpedition to Ifni sometime in March provided I can obtain a visa and license to operate there. At present I'm making up a schedule for submission to the Spanish consulate in application for license and visa. I hope to be there at least one week and will operate mostly 20-meter 'phone." This from CN8IE (W0LRP) ----- VQ4EI and ZD6BX chorus a few don'ts for all DX hunters: QRM from indiscriminate and ill-timed calling is an omnipresent bugbear; only the rankest DX rookie should be caught calling a station before he hears its signals, unless it be on schedule. QSYing with final amplifier on is another frequent curse. Overlong transmissions are nuisances; let the rare-DX station set the pace and tone of QSO. Stepping on another fellow's final transmission is strictly for the boors; wait until you hear an SK from each end of a QSO before

Not far removed distancewise, but rare by reason of its small ham population, is Guadeloupe, F.W.I. A burst of activity on the part of Antoine Noel, FG7NB, however, has put this country in the logs of many happy amateurs recently. Look closely at the neat set-up above and you'll see Antoine's 10-watt transmitter — smaller than the bug — in front of the receiver. To the delight of U. S. A. DXers, FG7NB is currently plugging away at his WAS on 20- and 40-meter c.w. (Photo via Salt Creek Radio Club, W9AVJ)

barging in, and if both ends aren't audible, be careful. Working DX with a non-T9x signal is no accomplishment; you'll only be worked in self-defense. . . . . RSEA (East Africa) has discontinued its WEA (Worked East Africa) certificate award. They add, "We hope to issue a new certificate with revised rules in the near future and will send further details when available." . . . . . Present active ZD6s include BX EF IJ IJN JL and RD. . . . . NCDXC and SCDXC Africanisms: ZD3BFC looks forward to two more years on 20 and 40, A1 and A3. ZS5JY is about to put his rotary atop a 150-foot h.c. tower and rival ZS1SW hoisted his wide-spaced job to the 115-foot level. ZSs 7C SE and 9H regularly are heard.

**Oceania** — In WIA's monthly organ *Amateur Radio* we note that top Aussie DXers per call area are VKs 2NS with 195 countries, 3BZ 224, 4HR 210, 5FL 143, 6RU 199, 7LZ 116 and 9GW 150. . . . . Yank hams interested in the NZART (New Zealand) WAP and WAZL awards can save time and postage by writing W0IUB. Roy will forward full details upon receipt of requests accompanying stamped self-addressed envelopes. . . . . SCDXC and NCDXC Oceanograms: F08AD QRTd in favor of European TV activities. VR6AC is preparing a rig for Pitcairn action. FK8AL, just back from France, goes at it with p.p. 80Ts. Routine relief of Australian expeditionary outposts may see VKIs DC and ZM replacing AC DJ and GA on Macquarie; VKIs AWI and RA may spell EG in Antarctica. EXP4BBD still endeavors to crack the red tape wrapped around his future DU license on Luzon.

**Europe** — This month sees the arrival of European DXcentment. USKA (Switzerland) throws its annual Helvetia-22 ball from 1500 GMT, March 19th, to 1700, March 20th. All amateurs are invited to participate, "phone and/or c.w., on all bands from 3.5 through 30 Mc. Stations outside Switzerland will strive to work as many HB stations in as many Swiss cantons (states) as possible. "CQ HB" or "CQ Switzerland" is the key. Scoring is simple: 3 points per band-QSO, this total to be multiplied by the total number of band-cantons worked. The exchange is the usual RS or RST report followed by the contact number (001, 002, etc.). But it's a task to tell the players without this scorecard of canton abbreviations which will be appended to IIB9 or IIB1 call signs: AG, Argovie; AR, Appenzel; BE, Berne; BS, Basle; FR, Fribourg; GE, Geneva; GL, Glaris; GR, Grisons; LU, Lucerne; NE, Neuchâtel; NW, Unterwald; SG, St. Gall; SH, Schaffhouse; SO, Soleure; SZ, Schwyz; TG, Thurgovie; TI, Tessin; UR, Uri; VD, Vaud; VS, Valais; ZG, Zoug; and ZH, Zurich. Logs, a separate sheet for each band, may be sent to USKA Traffic Manager HB9CZ. Certificates of merit are to be awarded to the three highest entries from each DXCC List country. And don't forget that USKA offers a classy H-22 sheepskin to each amateur who can submit proof of contact with all of Switzerland's 22 cantons. 'Tain't easy! . . . . . REF (France) sponsors an opportunity for amateurs throughout the world to further DUF award aspirations. Dates: radiotelephone, 1200 GMT, March 5th, to 2400, March 6th; continuous wave, April 16th-17th, same hours. All amateur bands may be used and the exchange is the same as that for the H-22 shindig. A "CQ REF" ought to set the ball a-rollin'. Logs, scores and comments can be addressed to F8TM, REF, BP 4201, Paris RP, France. . . . . D1AOR may attempt some HY1ORing about the time you read this. . . . . URE's EA5 contingent threw an on-the-air QSO spree over the past three months which netted lucky parties interesting DFV (Diploma Fallas Valencia) certificate awards. The deal was held in conjunction with Junta Central Fallera, Valencia's recent "Festival of Fire" spectacular. . . . . ON4s LJ and QX, Antwerp area members of UBA (Belgium), call attention to the WOSA "Worked Only Stations in Antwerp" diploma now available world-wide. W/K/VE/VO aspirants must obtain QSLs from five QSOd Antwerp ON4s, "phone and/or c.w. For full details write ON4QX. . . . . G3JOQ, radiop aboard British lifeboat *Aries* on its transatlantic test cruise last summer, writes: "On behalf of the captain and crew of *Aries* I wish to thank hams for their kind and able assistance. The QSLs which they will receive will be 'collectors' pieces' for there will be only nine at the most for U. S. A. out of a total of 140." . . . . . W8SHW, who recently completed a tour of U. K. duty, desires to express thanks to the G gang for outstanding hospitality received. Maurice befriended over 50 British amateurs and was a participant or interested observer in many of their organizational and operational undertakings. . . . . PJ2CJ points out that a few PJ-

prefixed Netherlands calls were issued in error. PJ calls henceforth will be N.W.I. issues exclusively. . . . . PA0GER wants a tracer on 1952 SV0s WO and WW, also noting that SV0WM is ex-W9SGC.

**Hereabouts** — FG7XA paid a recent personal visit to W4LVV and the two got together on the Guadeloupe QSL problem. XA took back with him a BC-348Q inhaler to augment the 6V6-S07 rig he uses, as well as antenna wire for himself and FG7XB. Both radiops are with PTP, the French version of CAA. W4LVV also supplied Andre with much miscellaneous gear plus some extra crystals to help the boys duck the pile-ups. . . . . T12BX's XYL has taken to hamming *con gusto*, assisting in keeping the Westlake installation warm for a good part of each day. T12BX works all bands, 160 through 15 meters, and one of their fortes is the accumulation of MM QSOs. The Westlakes picked off 78 countries in less than eight months of casual DXing. A Viking II, an NC-183 and several beams are employed. . . . . Two more states on 160 will give W2QHH WAS on six bands. A new Ranger rig and a higher skyhook are bound to help. Howy now has 111 countries collected on 3.5 Mc. and has QSOd some 400 YLs 'twixt DX sprees. . . . . W1CTW tells a story about the neophyte DXer who thought CN2s and CNSs were Chinese Novices! . . . . . YN1PM is ex-W10EK-W4SXD and expects to remain in Nicaragua indefinitely. Paul has a c.c. 25-watter readily workable on twenty. . . . . W3UXC could use a hint or two regarding means of securing VS9BC's QSL. . . . . W4KRR dropped in on a January meeting of the San Diego DX Club held at K6EC's diggings. . . . . Old-school DXer W9FLH, now relaxing with a 40-watter while contemplating a better DX QTII, would like a tip toward up-to-date info on old friend prewar J2GX, father of the yagi. . . . . The Salt Creek Amateur Radio Club gang at W9AVJ prepared for the 21st ARRL DX Test with a vengeance. Up went a 6-elementer on 10 meters, 108 feet high; 5 elementers on 15 meters, 100 feet up; and 5 more on 20, only 92 feet skyward. . . . . Big-sigger W4ESK now is back in the DX badlands as W7ESK, according to SCDXC sources. . . . . WGDXC has it that YN4CB has DXpeditionary eyes focused on the Great Corns; VP8AQ uncorked a batch of QSLs Statesward; and FP8AP sports a new 811s rig courtesy W0AIW.

Deign to dig the new Chicago address of your conductor; we'll try to hang onto this one for a while. (It's a wonderful spot for Jeeves to continue his indoor-loop antenna experiments.)

Ham radio provides valuable release and relaxation at our outposts in the Far North. Call signs VE8OC, VE8SD, VE8SM and VE8YT are in use among the ten members of the Frohisher Bay, N.W.T., Amateur Radio Club shown here. (Photo via W4HYW)

# Net Know-How

## *Improving Emergency Communications Effectiveness*

BY E. S. VAN DEUSEN,\* W3ECP

• In any emergency operation, the ability to handle third-party traffic promptly and efficiently is a "must." W3ECP bases his recommendations on experience gained in actual emergency net operations.

**A**MATEUR RADIO exists as a hobby because it qualifies as a service."<sup>1</sup> The extent of our service is limited by our ability. The responsibility for furthering these abilities is up to each one of us. Experienced traffic men will undoubtedly want to add to the following observations and suggestions for improving operations during an emergency. All hands will agree, however, that almost all amateurs are extremely coöperative during a communications emergency. The occasional operator who fails or refuses to coöperate during such a period deserves short shrift, with thorough application of the Wouff-Hong and the Rettysnitch.

The operator who learns of an emergency and experiences the universal desire to help may unnecessarily delay and complicate the flow of traffic, if he has little or no concept of acceptable net procedure. He can best serve by familiarizing himself with the situation by *listening*. Careful listening will enable an operator to locate stations and places and to get a good idea of the over-all situation so that he will best know *how* to help if needed. A desire to help through transmitting is often more hindrance than help. If you're not needed, silence is the biggest help! Eagerness to aid isn't an excuse for breaking into the net. Proper procedure by the net control should provide opportunity periodically for additional stations to report in. Only when urgent information pertaining to the situation at hand should be made known to the NCS is breaking-in permissible. Having once reported into a net, however, every station should monitor the net until he is excused by net control.

### ***C.W. Circuits Always Advisable***

In the initial stages of an emergency, much may depend on a single station's ability to communicate with the unaffected area through use of "flea-power" c.w. equipment. When commercial power fails, there may or may not be an emergency a.c. source available. On the other hand, there undoubtedly will be auto storage batteries in the area. Reliance on such primary

power sources requires the ready availability of suitable vibrator or dynamotor units. It is obvious that c.w. circuits should always be provided whenever and wherever possible, as either the primary or a secondary channel into the affected area. No single emergency situation has been observed recently in which the amateur effort could not have been aided materially by the use of *both* 'phone and c.w. In several recent situations involving 'phone emergency networks, a request for supplemental c.w. circuits, or an inquiry regarding the possibility of setting up such circuits, has been included in the operations shortly after the net had been organized.

### ***NCS Qualifications***

Efficient management of a net of any sort, and especially one working under emergency conditions, requires firm discipline by a suitable net control station. The NCS should be capable of hearing and being copied by a majority of the participating stations. This individual (or group) should be thoroughly familiar with control procedures, and cognizant of the propagation conditions that currently exist on the band in use. He should be able to think logically and quickly. Real competence as a control station can best be attained by practical experience. Book learning alone can't replace the knowledge gained from hours spent listening to net operations, analysis of the various situations which arise, and thinking out a better way of handling them if you had been NCS. A frequent turn as NCS is an invaluable aid to put your ideas into action and test your reactions.

### ***Net Discipline the Responsibility of the NCS***

The supreme authority for priority and traffic routing is the net control station. In an emergency the first station becoming aware of the situation should assume control and retain it until some station better qualified (by virtue of experience, location, or ability to contact a greater number of participating stations) becomes available. When a previously organized and trained net is involved in the incident, this is fairly simple to accomplish. Generally speaking, the most effective emergency networks are organized before an emergency. In many cases, however, the net organization is evolved *after* the situation arises. When this occurs, the station first assuming control must exercise a high degree of common sense in analyzing facilities which become available, and should act quickly and without rancor in turning over control to a better qualified station

\* Route Manager, ARRL; 3711 McKinley St. N.W., Washington 15, D. C.

<sup>1</sup> ARRL manual, *Emergency Communications*.

that reports into the net. On the other hand, until such a transfer is made, no other station has any right to attempt to usurp the control function.

In prolonged operations involving the services of a succession of net control stations, a complete list of stations active in the circuit at the time, the areas they serve, and the outstanding traffic, if any, should be given to his successor by a control station who may be leaving the net.

Experience with established traffic nets has conclusively demonstrated the increased efficiency which results from the use of at least two or three adjacent channels. One frequency, preferably the center frequency, should be used for monitoring by all stations, and transmission by the net control. The additional channels are used as message-clearing frequencies. On c.w. nets, a separation of 5 kc. is sufficient; on 'phone, a wider dispersion may be desirable.

When FCC declares a general state of emergency, a 10- or 15-kc. band segment may be designated exclusively for emergency communications (Section 12.156, FCC Rules and Regulations). With this in mind, it's logical to start net organization (under these conditions) on two channels about 8 kc. or so apart, and modify the arrangement as the situation develops. During such an emergency period, "guard" stations should be assigned the specific job of transmitting the FCC order and warding off interference.

### ***Provisions of the Law Must Be Observed***

A possible law violation (Section 605 of the Communications Act) may inadvertently occur when press representatives are permitted to be present in the amateur "shack" during emergency operations, especially when the operation is being handled by 'phone. They should be reminded that the Act states that the content of the communications may not be divulged to or used by any person or persons except the addressee or his agent. "Pirating" of traffic is an obvious violation of the Act. When situations arise in which a station may be in a position to deliver or expedite certain traffic that has been copied during monitoring, permission must be obtained from the transmitting station to accept the message. Only when this station releases its own commitment does the monitoring or requesting station become authorized to handle the traffic. Under no circumstances is a listener permitted by law to put pirated traffic on another net; this might easily result in duplicate delivery of two widely differing versions of one message, in addition to being a distinct violation of the secrecy provisions of the Act.

### ***Accuracy Is More Important Than Speed***

*Accuracy first* should be the motto governing all traffic operations. It is especially applicable to an emergency situation when lives and property safety often depend on the messages being

handled over the amateur network. Accuracy is more readily achieved when uniform message procedures are employed. Uniformity of the message form is very important. In emergency situations, it is always desirable to include the filing time which is frequently omitted from the message preambles routinely handled on normal amateur circuits. The use of standardized texts such as the appropriate ARL-Numbered Text<sup>2</sup> and the "book message" method and, whenever possible, a combination of both, can result in the movement of a surprisingly high volume of traffic when applied with common sense. The receiving stations should withhold a "Roger" (voice) or "QSL" (code) for any message until it is certain that the entire message has been completely and accurately transcribed.

More effective voice intelligibility is obtained by the use of words instead of c.w. abbreviations. (In military practice, accepted 'phone procedure prohibits the use of coded c.w. prosigns and requires the use of the worded meaning.) For example, the use of QRX<sup>3</sup> instead of "wait" may be misconstrued as QRS unless phonetics are used to clarify the letters QRS. You'll wind up by saying the one word "wait" anyway, so use it in the first place and you'll avoid confusion and time loss.

Many 'phone operators speak too rapidly for the average operator to copy. The time spent in securing "fills" or confirmations often takes longer than would have been required to clear the entire message if it were transmitted at a proper rate. It is very helpful to speak in phrases, allowing time between phrases for the receiving operator to copy legibly. As a rough gauge, transmit the

<sup>3</sup> Actually, QRX means: I'll call you again at a specified time. — Ed.

# Three Stormy Sisters

## Part II† — Hazel

BY GEORGE HART, WINJM

COVERING more land area than either of her older sisters, Hazel probably did by far the greatest amount of damage. We received reports from each section on Hazel's route, plus a good many reports from sections on her fringes. And this gal had *some* fringes. Although she passed through Central Pennsylvania and Western New York, Hazel produced sixty-mile-per-hour gales and torrents of rain in many areas not more seriously afflicted.

On the evening of October 14th, Hazel approached the Carolina coasts. The South Carolina Emergency Net was already in operation under PAM W4FFH, assisted by W4HDR and W4HMG. At 0130 Georgetown EC W4ZGP assembled his AREC members W4s FTN GIL KTI COA and DYP to place W4ZGP/4, the club emergency station, on the air. This station was manned throughout the night.

At 0300 W9MQV/4 reported into the net from Myrtle Beach, and also remained on through the night. W4LLH helped maintain contact with the coastal stations through the night. Communication and power lines began to fail by 0800 Friday morning and weather reports from W9MQV/4 and W4ZGP/4 enabled the Weather Bureau to determine that the hurricane went inshore at Murrells Inlet, S. C., at 1000 Friday.

Continuous contact was maintained with the Georgetown and Myrtle Beach stations with on-

† Part I of this article appeared in January, 1955, *QST*.

• We asked for them, and we got them — more reports on activities during Hazel than we could possibly use. In this second installment of the hurricane story, we have tried to stick to facts and credits in condensing volumes of report material into a few *QST* pages.

the-spot reports being sent showing the extent of the damage as it happened. Intercepts of ham operations as provided by W4FFH were being broadcast over radio and TV stations in Charleston. W4ULH/mobile was sent from Florence, while mobiles W4UOQ and W4QRH were sent from Charleston. These emergency stations were confronted with a most serious situation. All communications and power lines were out. There was urgent need for troops, blankets, emergency rations and medical supplies. Through W4ULH/m and W4HDR in Columbia, Myrtle Beach authorities were advised where rations and blankets were available, and that National Guard troops were being ordered into the area. Shortly W4UOQ/m with W4ZRH riding with him reinforced W4ULH/m. Police officials and reporters rode with W4ULH/m to tie in with police radio and the outside to conduct emergency operations. Georgetown power failed about 1000 and control was shifted to W4ZGP/4 from his car, using a long wire to replace his mobile antenna at 1400. Then mobile W4s ZGP COA and KTI cruised Pawleys Island and near-by beaches. The amateur mobiles coordinated with other units to provide communications with damaged areas.

On Friday W9MQV/4 was back on the air by 1730. Weather reports by ham radio assisted the Weather Bureau to give an early all clear.

In Florence, EC W4AUL had mobilized his AREC group W4s DXW TSU VAM VOH ULH and LLH long before the storm struck. W4LLH maintained contact with W9MQV/4 all night Thursday. W4ULH/m was dispatched to the coast Friday morning. W4s AUL DXW TJA and TSU helped dispatch ACL trains. On Saturday morning the AREC membership cards permitted amateur mobiles to cruise into restricted areas to continue their work. Only those messages of highest urgency were accepted for delivery. On Saturday evening, W4s ZGP DYP and FTN set up a transmitter unit at Myrtle Beach and operated all night.

Operations were carried on for days after the storm with W4FFH conducting the net almost continuously, assisted by W4s HDR ZIZ and HMG. W4BNN provided contacts with Dillon

W4KFC's beam elements don't always have this graceful curve. This is a shot taken during the height of the storm in Annandale, Va.

When Hazel decided to take a jaunt over-land, Myrtle Beach, S. C., was the first to feel her fury, and Al Powell, K4AQQ, was there waiting for her. From this compact station layout, K4AQQ (who was signing W9MQV/4 at the time) provided sole contact with Myrtle Beach for many hours.

and W4MPR with Marion county. The following stations deserve special recognition: W4s ZGP FTN GIF KTI COA DYP UOQ ZRH ULH FFH HDR LLH AUL DXW TSU VOH VAM ZIZ HMG STN TWW IZD K4ADP USN W4MPR BNN TWW TJA and W9MQV/4. PAM W4FFH logged 168 stations reporting to assist.

EC W4SOD reports that Lumberton lost power at 1051 Friday, October 15th, and he, from his mobile rig, became the only contact from the area.

In Raleigh, W4HUW operated entirely on emergency power from 1330 October 15th until 2000 October 16th, mostly in the Tar Heel Emergency Net. Among those reported as participating, W4HUW lists W4s ACA APP AHY AWM AUL AWC AJT ANU ATC AEF BMD BUA BFB BTZ BDH BIP CCG CPL CVQ DIU DJC DCI DRC DVR DXJ EFX EPI ED EC EYZ FRH GNF GJS GOB HZX HPS HAY HCB HSO HUW IBT INL ISH JZQ KYI LWU LPN LR LGT LVZ MVP MPR MBR MDR NC NHV NTQ NYN NRN NY PZE QI RXH RCZ RRV RJ RRH RAZ RNA SCS SGD SVD VZW VWM VUA WSS WUW WDN WTF YPZ YPI ZMG ZQB ZQA ZEA ZAV, K4s NAW NRI WAR FDY WBI, W3STU/4, K2BSC, and W0WDJ. The net handled about 2000 messages from October 14th to 20th.

The Virginia 'Phone Net and the Old Dominion Net combined forces on 3835 as the Virginia Emergency Net starting on October 14th and operating continuously until the evening of October 16th. FCC declared 3830 to 3840 kc. a clear frequency within 1000 miles of the coast. Doing yeoman service as NCS were the following: W4s PCC (operated by W4s BTL GPS LNX JXE KQC SBZ UGO ZZV and W8NYH) TFX HQN SIE TVO ONV VYG NV SB and BTL. W3BHK served almost continuously as liaison with Washington, assisted by W3OHL. W4VYZ acted as relay to handle traffic between the Pentagon and Fort Monroe, Va. W4KX lists the following known participants: W4s AAD ACA AHY AJA APP AWQ/4 BCW BGZ BIG BLR BMH BSM BUS CKI CLD CSC CYK/4 DWP DXJ EC FPR FV CWY/m GBD HJH JAQ JAU JG KAV KBE KDJ KSE KX LAS LHC MAN MRH MT NBA NPT NY OGX OKM OM/m OXY PHL PJT PMF QCA QEL/4 QIE/m RCZ RDI/m RGN/m RGZ RJW RLA RTV TFZ TJA TJW TLA UBC

ULZ UMC VAH VOD VW VYZ WEL WLQ WUW WYI/m YCC YKB YVG ZBU ZCL ZMG ZNT ZUQ; WN4FTD; K4s ABQ AF AIR MC NRT; W1UKZ/4; W2FYT; W3s BHK BAI BRC JE JTU/4 LUV/4 LZY NOL OHI HDV STU/4 TVJ/m TYU UF WBJ WVF/mm WZN YF; K2FBD; W9GWY/4.

In Hampton, W4AJA was on the air from 0800 on Saturday until the same time Sunday morning, when c.d. control W4RGN took over. W4VYZ handled a crucial message to Fort Monroe via W9GWY/m near Washington. The following stations in Hampton participated: W4s AJA RGN MAN/m VYZ/m RTZ QCA/m ZXL GZD/m JCM. W4RGN and W4QCA operated on emergency power.

In Norfolk, EC W4PAK alerted the AREC gang at 1900 on October 14th, and 29 mobiles and two net control stations turned out. Participation was on both the VFN frequency of 3835 and the local 29.6 Mc. frequency. By 1500 on Friday the winds had reached 100 m.p.h. and things started to happen. Communications were handled for the power company, the Weather Bureau, Civil Defense, and local Red Cross and emergency traffic was being handled as fast as the net could take care of it. All transmitting was done with auxiliary power equipment. When the 75-meter antenna blew down at the control station, W4PWX and W4LCW maintained communication for Norfolk.

EC W3WN of Frederick, Md., reports a close tie-in with Frederick police, working with them from the time Hazel hit Frederick (1745, Oct. 15th) until about 2100. Mobiles were dispatched with policemen to points of hazard. The Frederick net mobilized without being alerted.

In the Washington area, W3KZQ, W3NL, and W3ECP were early on the job getting the Washington Mobile Radio Club organized at the request of the D.C. Chapter, American Red Cross. W3WLA took over net control on 29,520 kc. at 1615 on October 15th and checked in mobile stations to take part (almost 100 per cent). W3KZQ conducted the 1800 roll call on emergency power. W3ECP maintained close contact with the Red Cross during the blow. Stations listed as active: W3s AQZ DAH DZZ ECP EOY EQH FVD FZ IEF IZL KZQ MAX MBZ MSU MYA ND L NL NUT ODK OLK OPO QBC

RCZ RXJ SFY THP WAM WLA WOX WXA  
WYP YAE ZER, W4s: BF BFN DWD EFJ  
EHO GEB CJJ JKN JSG KCX KMG LL OP  
TNQ TTA UEQ VYP YWF ZZ.

The AREC of Washington County, Md., was alerted by both Civil Defense and Red Cross and by 1415 October 14th seven AREC members had three fixed stations and five mobile units ready for action. By 1800, fourteen AREC members were monitoring 3827 as well as assisting the MEPN and the VFN with emergency traffic, with five mobiles and one portable power unit on a stand-by basis. The alert was secured at 2030. Stations on deck: W3s CIQ CKJ CSX EHA NZT OAY ONL OYN RAH SCC TJV VAM WWM YRK.

The Maryland Emergency 'Phone Net was active on 3920 kc. At 1155 on the 15th, the emergency plan was put into effect. At 1650, FCC declared 3815-3825 kc. an emergency channel. The frequency clearance was withdrawn at 2200, but many members continued operating throughout the night. The following day operation continued, most traffic being relay of information north and south concerning the extent of the damage. As conditions deteriorated Saturday night, FCC gave voluntary clearance on 3820 at 1800. The net was official signed off at 2000. W3FWR submits this list, with apologies to anyone left out: W3s AKX AVL ADQ AED BM BSV BRU BHK DKT EHA EPC EQK FRV FWR FII GA GD HWR HXN HWZ HL IJF JZY JE JQN JH KMT KVM KAN KZH KAV LZY LUV MCD MAX NJT NST NNX NNS OHI OLK OKZ PMQ PRL PQT PPY PV PGB QDI QAN QQH RU RMD SSC SZW SOG SPT TJV TDV TUX TAT UNV UAC UQS UAB UWV UF VAM VPN VZZ VCN VVV WKB WTF WBY WV WBP WEH WEM WZN YWK YYF ZME ZA ZZK, K3s FBD WBJ NAR WAS, W2FUW, W4s BUS HZ NFD.

Mobiles in Anne Arundel County under EC W3SLG got together as prearranged at 1700 on the 15th and manned the control center, using emergency power since regular power was off. Net Control W3VPR (manned by W3JKU and W3SLG) contacted State Control W3WBP on 29.64 Mc. W3TRG/m was assigned to handle Red Cross communication. W2UQS/m was stationed at Edgewater police station. Telephones

Hazleton, Pa., was one of the cities hard hit by Hazel. EC W3DUI activated his small group and operated on emergency power. That's him at the telephone, while W3OHX uses the mike.

failed at the control station at 2000, and all communications were handled on 6 and 10 meters. Clearance from emergency was obtained at 2200. Damage was slight. Other mobiles in the act: W3s NLX LHK VU NAE OEJ TRG UKO UQS.

In Allegany County, amateurs under EC W3PMQ installed six-meter equipment at the police station and the club room of the Mountain Radio Club at the American Legion building. The call W3YMW was used. The following amateurs participated: W3s ECU MGO KMT UAB UAC, WN3s YII YIJ and WSGHS.

The Radio Officer of Maryland's Fifteenth C.D. District, W3QLG, was called upon to provide communications and enlisted the aid of W3s FMG WCW KLA and WN3YLQ, all with mobiles on two or ten meters. The mobiles went into action at 1730 October 15th. Evacuation was their main task, the mobile units being placed at the disposal of the c.d. officer in charge. All communications and power were out in the area until the following day. Mobile units were released at 0400 October 16th.

W3AVL reports for Southern Maryland that considerable damage was wreaked by high winds in that area, after weather reports had indicated that the hurricane would pass to the west. Electric-power failures occurred at intervals from 1100 until 1700 on the fifteenth, at which time power in the entire area was shut off, and telephone service also was out. W3AVL operated with emergency power. On Saturday W3AVL/m traveled to St. George's Island where information on the amount of damage to houses and other property was reported via W3PPY.

In Cecil County, W3VZZ started organizing the local net at 1430 on the 15th. At 1600 his power went off, so his station was set up at the fire house, with the help of WN3ZVX and W3TXR. The station was put on the air, immediately reported into the net and started handling traffic. The county c.d. director was much impressed with this operation.

As a result of activity of Maryland amateurs during Hazel, a letter was received by State Radio Officer W3JE from Maryland Governor McKeldin saying, in part: "It is gratifying to me to know that our State has such a magnificent communications network which can be utilized in the event of any large-scale disaster. I compliment you and your associates for your outstanding organizational activities and hope that my congratulations for a job well done can be extended to your membership."

On Friday night October 15th from 1800 to 2000 Hurricane Hazel unleashed its fury on Delaware. W3SQV, chairman of the local "Blue Hen

Mobile Group," at about 1700 called the Net on 29,520 kc. and offered service to the Wilmington Red Cross and the Delaware State Police. Those standing by were W3s FFF NNK PCZ QWR QZI SQV TDU TKM UO and W4ANL/3. The group was released by the Red Cross and the State Police at 2130.

W3BHK did a great deal of relay and contact work for Washington Red Cross during the hurricanes. During Hazel alone he indicates 60 sent, 40 received, 33 relays and 22 patches. He operated 48½ hours, 5½ of them on emergency power.

In Montgomery County, Pa., EC W3CNO reports communication established with state-level key station W3OJE at 1920 on the 15th, and set up monitoring watches on 28,888 and 29,493 kc. between the hours of 1800 and 2100 EST. The following stations called in: W3s TER/m TWQ VST. W3s HYU and IGW were listening. All stations had mobiles available in case of need. The net was secured at 2100 EST.

York County (Pa.) got the brunt of the storm, and by 1500 on the 15th power was off in large sections of the county. W3GES took over as Acting EC and took part in the Pennsylvania Fone Net, acting as NCS for a part of the time. Earlier, W3GES had alerted three other local amateurs with mobiles and had offered services to the local Civil Defense and Red Cross. W3GES was assisted by W3VNJ and W3WWF.

Hazel roared toward the Philadelphia area in the late afternoon of the fifteenth. The city's c.d. volunteers were alerted and manned the c.d. centers, starting at 1800. Members of the Phil-Mont Mobile Club checked in from their radio-equipped cars and stood by for assignments. The Fox Chase Control center lost power after 1900, but a generator on a c.d. rescue truck was utilized to supply power. The centers were allowed to "secure" at 2145. A partial list of participants as submitted by EC W3DYL: W3s SQW VKO ULR SAM YUH WMY SLP DYL NJS FPC YAX VSC OWK UQV RKP VCE VCY DFJ JWC UOE PST.

Luzerne County had some activity, reported by EC W3DUI. He got together with W3OHX, who had emergency power available, and about 1900 when power went off operation commenced from that station. The police and c.d. were served by amateur communications. W3THB and W3PVY were also on hand and two mobiles were ready.

The Pennsylvania Fone Net, under W3PYF, did an excellent statewide job during Hazel. W3PYF asked W3GES to start organizing the

net at 1525 on the 15th, while he set up his emergency power and took over the net at 1600, by which time 26 Pennsylvania stations had already called in. QRM gathered, too, and with the assistance of W2JWN, W3UKF and W3BHK FCC was asked to declare a clear channel which they did (3850 plus and minus 5 kc.) at 1915. By 2000, 21 stations had called in.

There was also activity in the local Northampton County (Pa.) Net on 29,640 kc. The Bethlehem C.D.-Red Cross stations were activated with W3QBF at Red Cross and W3NNT and W3PQX at C.D. headquarters, both on emergency power. Contact was maintained with mobiles in the stricken area at all times (W3s NF OK QMH ELH and W1UVE).

The New York State Phone Traffic and Emergency Net was in operation starting at 1700 October 15th with K2BYO as NCS. W2s ZRV UNF JNM ILI and YXE consecutively took over NCS duties, and at 2300 Oct. 15th when skip lengthened, WSPXF assumed net control, and later W9VRK. The net was closed at 0115. About 52 stations participated.

In Broome County (N. Y.) the two meter net was in operation with W2s SWF/2 OW PST/m JOJ FCG QXX HJS UJS HZP/m DOM SDA and K2CWD. The Binghamton area was badly hit, and W2SFW/2 was set up at the Binghamton Sun offices to receive reports of damage.

At about 2000 on October 15th, electric power and half of the telephones went out in Oswego County. EC W2ZHU/m, W2UMI and W2FFU went into action on 2 meters. W2UMI reported two fires burning in Mexico, N. Y. The AREC stood by to assist in fire communications until the fires were brought under control at 2300.

Four Oneida County stations reported in on 3925 kc. about 1730 October 15th and remained until 0100 Oct. 16th. Two meters was monitored from 1800 the 15th until 1200 the 16th.

In Seneca County, local AREC mobile stations were alerted at 2045. At 2130 Hazel struck the area, commercial power went out and many trees went down. From 2135 to 0030 the mobiles assisted in providing emergency communication for the police, who had no emergency power. At 2230 until 0030 mobiles also provided additional communications for the Sheriff's Department. Participants were W2s YPP HNK and K2s BFF HMY and DYA.

The Finger Lakes 2 Meter Net was in operation

The Northampton County (Pa.) AREC gang activated the station at c.d. headquarters in Bethlehem during Hurricane Hazel. The station operates under the call W3PQX/3 in the Delaware Lehigh Amateur Radio Net. Left to right are W3OK, W3PQX and W3NNT. (Photo by W3PYF)

from 2000 to 2300 Oct. 15th. Stations in this Net included amateurs in Monroe, Ontario, Wayne, Cayuga and Genesee Counties. Participants were: W2s BCL BLP CTA ECM OWF QY TKY UNP VBH ZHB ZS UTH, K2s BWK CEH DBB, KN2INO.

In the Syracuse area, W2BTB was kept busy with weather and radar reports to the local Red Cross Chapter Disaster Chairman, and handling a number of welfare requests for Red Cross' Home Service Department. At Red Cross headquarters, W2CRD was activated and performed valuable service all during the hurricane.

Hazel poured between five and eight inches of rainfall into the Toronto area within the space of a few hours, precipitating unprecedented floods. More than fifty bridges and culverts were washed out, and hundreds of homes near the river were washed away or damaged. The AREC plan of listening on the emergency frequencies of 3765 kc. and 51 Mc. was followed.

Of the v.h.f. group, VE31Z was the first to become active, out in his mobile at 0730 on October 16th. VE3AIB joined him at 0900, and shortly thereafter VE3BQK/m and VE3BYY came on. These four set up a v.h.f. net on 51

various search parties and headquarters was maintained via VE3s ARV/m IZ/m and AIB/m.

This grim task was not the end of it for the Toronto gang. Communications were out in the area for several days after the hurricane, particularly in the Westmount area, and the AREC was instrumental in providing communications for emergency purposes. As late as October 24th, the Toronto v.h.f. group was working with officials in Westmount, Etobicoke, Woodbridge and Pine Grove, as well as Toronto. Mention should be made of the supplementary work of the following: VE3s AIB ATB ARV/m AZY BJB BYY BYZ DER DQW DHG IZ and UT.

Low frequency groups were also active in the Toronto area. VE3EAM alerted VE3s BBM and EAU, then took off for Woodbridge. Arriving at 1200, Bert set up his equipment in the municipal office, and the first message he handled was from the mayor requesting troops, food, medical supplies, etc. From then on he handled a constant stream of urgent traffic to VE3BBM who relayed to VE3BJV for delivery by Toronto telephone.

Nets were also set up and operative on the ten and 75 meter bands, under VE3NG and VE3RG respectively. VE3NO did an admirable job as net control on the 75 meter net, and VE3NG turned in an outstanding performance on 10.

The Hamilton AREC group was called in on Sunday the 17th to help in the Woodbridge area. Six cars and a portable unit were immediately dispatched. They set up immediately on arrival and helped with communications for the Red Cross and Fire Department. Later, they opened a ten meter net to Toronto. In action: VE3s KM DGJ DRM AXV DRI AGJ BOW CJM EAB DHQ CJ CC AYW and BV.

All in all, a stellar job done by Ontario amateurs, especially the gang in and around Toronto. Here's a list of participants not already mentioned above: VE3s AZX ATR AWY APN AET AJA AID AIA APF AXW AMB AEU AYO AMT ANL AOE AGW AIS ANY BWA BQT BBM BJI BUT BRI BCT BBX BCR BKV BAX BLQ BIV BTY BNK BNW BJV BWE CD CP CJ DDT DHL DTO DFN DZA DUG DSG DNE DLS DEW DQX DFP DPD DEG DFA DFK DCF DNK DNA DIQ DAT DAK DOW EAO KW GK RU RH IL HZ TA NS GJ VG RW NI HO GG LN OR SI HS VZ YD VT WY VE2UQ. Our thanks to VE3KM, VE3AIB and VE3IL for their comprehensive reports.

The swirls of Hazel's skirts produced havoc elsewhere than along the path of her baleful eye. W2RTE reports activity in Eastern New York section comparable to that in Carol and Edna, nets operating on 75, 10 and 2 meters. W2RTE himself had to set up emergency power to stay with the net on Saturday. Even over in eastern Mass. the effects of the hurricane were severe enough that six members of the Falmouth Amateur Radio Association formed a net to maintain contact with Civil Defense, the Coast Guard and the National Traffic System. The amateurs who turned out were W1s QLT LYV DVS UXG and TJW with the club station W1WNM as NCS.

This innocent-looking contraption is an emergency generator. Simple enough, but it spelled the difference between being on the air and not being on the air during Hazel in a great many places. Does your AREC group have one, ready to go at a moment's notice if needed? Hazelton has, and this is it, plugging away during Hurricane Hazel.

Mc. and advised the 75 meter net control, VE3NO, of their availability. VE3IZ/m and VE3BQK/m were dispatched to Woodbridge while VE3BYY/m and VE3AIB/m went to the Weston area, both hard hit. VE3DER operated fixed to keep them in contact with telephones. The next day mobiles were dispatched to Weston to assist in the search for bodies. The 51 Mc. control station (VE3AZY/3) was moved from CD headquarters and set up in the Weston police station, with VE3DQW assisting. From approximately 1300 until 1730, communication between

The six-meter gang was very active in the Toronto area during the hurricane. This is VE3AIB, one of the Toronto ECs, operating equipment belonging to VE3IZ in Weston, Ont. This set-up, from a church location, provided emergency communications for over two days from Weston.

W2ZAI reports activity in both Queens and Nassau Counties, N. Y. In Queens, the ten-meter net was in operation from 2030 on the 15th until 1300 on the 16th, with 25 stations reporting in. Six members stayed at the Queens County Control all night: W2s AFA AKR ANK CVU CJP and ZTX. Early Saturday morning mobiles W2ZTX and W2ANK were dispatched to Rockaway Beach, along with W2CJP. Traffic handled was in regard to flood damage and evacuation. The Nassau County AREC was alerted at 1630 on October 15th by EC W2FI. He set up W2FI/2 at the Red Cross, and three other stations, W2KEB, W2KFV and K2DHC (operated by W2JKX), were activated. Mobiles used both 2 and 10 meters. Forty-four stations reported into the net, three from Suffolk County.

Although considerably west of Hazel's path, flooding occurred in the Ohio River Valley. Amateur radio was called into action at Steubenville by the Red Cross, and three stations were set up. Operators taking part included W8s DNQ ERR JNL SFI EZC ZE1 V GK EZH and CHE.

In the Camden, N. J., area, two and six meter nets were activated by the South Jersey Radio Association at 1800 on the 15th. W2YRW was NCS of the 2-meter net from his car at first. Later, W2PAU took control using emergency power. W2TBD assisted the local police in Medford and Medford Lakes. W2LY reported from mobile that cross-country high lines were falling near Route 38, hampering vehicular traffic. Others reporting in on the two-meter net were W2s EGP JRO PEN NFL VX ASG OQN PTM PZX, K2AFJ and KN2s GYH GYN and JE1. K2AJD was NCS of the ten-meter net, assisted by W2QBH and K2BWG. The roll call produced W2s ABQ YPQ CIJ FTO CKX TXP, K2s DWY BZK, W3s AOE/2 OEN and HEK. Many of these were mobiles. Contact was maintained with the Burlington County (N. J.) net on 29,560 kc. Operation of both nets continued from 1800 to 2200. W2YRW reports that 32 operators turned in 128 man hours of work in his area.

The Burlington County (N.J.) Radio Club also reports considerable activity during Hazel. With four mobiles and two fixed stations, the entire group of six stations was in operation during the storm: W2s EVR GOK JJV WK1 WUP and ZNB.

The RACES net of Conn. Area 4 was active during Hurricanes Carol, Edna, and Hazel. The

net control station, W1TIJ, is located in the State Police barracks in Colechester, which is equipped with auxiliary power. The following radio officers were active: W1s IWY YFG UQV/1 ZYJ/1 NPB EBO KZQ NPE/1 MHF and LF. W1PHP is radio officer for Area 4.

The transcontinental Relay Net again was on alert following the path of Hazel and sending out bulletins concerning her progress, speed and direction. The frequency of 7042 was kept clear for the bulletins and reporting stations. Net stations, especially those in Hazel's path, kept close touch with their local weather bureaus both to receive and give information. The net likewise did a most commendable job of handling a great deal of long haul emergency traffic, much of it of an official nature. Many of the stations were operating on emergency power. Net manager W3CVE submits the following list of participating stations: W1s QA YEL, W2s BO CGG EQG IFP QDM, K2BJS, W3s BFF CUL CVE DVO IA RQK/4 UUA WWQ WOR WZL, W4s AMZ ARV ATS ATC DNB DNR ENI EJQ HIH MCY MPF ONK SVG TJI UWE VPD VHH WQT, K4WBK, W6s BOM/2 EUM ULS, W7CCL, W8s AUJ CJK DNC FUM FFW IZQ ZWE, W9s JUJ NZZ RHA UIN VBZ WRO, W0s AJD CIO GBJ KA, VE3s BXF BUR DUY, KL7ATO/W9.

### Epilogue

Many of those who reported also reported the many lessons they learned in operating under emergency conditions as hurricane followed hurricane into some of the most populated and industrialized parts of our country. These three diabolical visitations, similar to but more extensive than the series of tornadoes we experienced in 1952, have a parallel in atomic warfare. What we amateurs did in the hurricane emergencies we must be prepared to do in the event of nuclear attack, multiplied manifold. If the visits of Carol, Edna and Hazel can be considered in any way to be good, then it was because of the "shot in the arm" they gave to emergency preparedness everywhere they visited, and to the increased awareness on the part of public officials, Civil Defense and otherwise, of the values and potentialities of the radio amateur.

**More on FCC Suspensions.** Two amateur operator license suspensions were reported in these columns last month in *QST*. Looking at eleven other 1954 amateur operator license suspensions, there were some five kinds of violations that drew this type penalty. In each case the suspension required that the license be turned in to FCC and the station not be operated by any person for the specified period.

1) Two instances, violations of Sec. 12.157 by using "obscene, indecent or profane language" on the air, received penalties of 90 days (W4ESP), also four years' suspension (remainder of license term) was invoked in the case of another amateur licensee, now deceased, for wilfulness in committing this violation.

2) One Technician Licensee, WIUZZ, drew a 90-day suspension for operating on the 144-Mc. band contrary to his license privileges.

3) Three Novice (WN0QIY, WN9ZEV, KN6BOS) and two Technician licensees (K6AXX, W6CKW) received suspensions of 30, 90 days and for remainder-of-license term for violations of one, or combinations of more-than-one, of the following: use of A-3 in 3.8-4 Mc., or in 7 Mc. (12.23 d-e); using call not assigned (12.158); use of unmodulated carrier for protracted periods (12.134); and for failing to keep a proper log (12.136 b and f).

4) A suspension of 30 days was made in the case of WIZE for permitting operation by an unlicensed person, which is a violation of Sec. 12.28, and Sec. 318 of the Act, also for failure to keep an accurate log (Sec. 12.136) and failing ability to produce logs in the 1-year period prior to May 10, for FCC inspection, a violation of Sec. 12.137.

5) W6SAC's 30-day suspension was for use of power in excess of 1 kw. (12.131).

6) A suspension for remainder of license term was ordered in the case of WN9YDZ for using a frequency and call not authorized a Novice.

**On Improving Message Handling.** Besides the questions from amateurs newly interested in this field these days, some traffic netters are urging steps for progressively improved results . . . such as an increased use of the *service message*. Operating an Amateur Radio Station, page 12, gives the low-down on such between-station traffic, customarily started to get missing information, or report inability to deliver, or other aspects of the operating service. Each year for three years there has been a substantial increase of interest in traffic handling. With the trend continuing this year, we hope the "service message" will account for a proper proportion of the increase, for the great good this can do. Missing parts really should be queried at source (by originators), of course, so incomplete traffic never gets started! However, we suggest making it common practice to use the service message to get the missing parts when they are not put in by the originator. Undeliverable messages should be reported by message to originating stations in all cases. But let's stop at source, by reasonable interrogation, crippled traffic that has vital sec-

tions missing from the preamble or an insufficient address. Any service message sent not only counts in one's total but is a direct contribution to our amateur ability to handle record traffic in a praiseworthy manner.

**Edison Award Winner Acclaimed.** Ben Hamilton, W6VFT, ARRL SEC, of La Mesa, Calif., was honored February 10th at a Washington, D. C., public dinner presentation of the 1954 Edison Radio Amateur Award. This was in view of his outstanding civil defense communications, organizational and educational work in San Diego County, Calif. There were special citations for the notable services of Carl Theis, W8BKH, in constructing equipment for missionaries resulting in saving lives, and for the excellent amateur radio communications established and maintained by Carter Rogers, W8NCB, in the West Virginia flash flood. Besides proclaiming Mr. Hamilton award winner, the judges also adopted a resolution commending the meritorious services of more than 800 amateurs helping with emergency communications in the triple hurricane emergency. Besides the special honor to Mr. Hamilton, we regard this acclamation as a great honor and recognition of importance of civil defense amateur radio organizational work.

**Observations of a Novice** working in the Round-up are the subject of a letter from KN2IIW. He writes, "We can't all be perfect but calling attention to some of our operating errors in *QST* should help in improvement. I found myself going *over my speed* and having to correct errors, also extending my calls too long and repeating too much of my text. Then there is the man who has never heard a W1AW tape or so it seems . . . when he calls CQ you can only guess what it means. Another has a note like water bubbling in a pipe so it's a wonder he gets any answers outside of FCC citations. My pet peeve is a WN using a bug with jerky spacing; the dits get away from him. . . ." All amateurs will agree that a bug has no place on the air until it has been mastered in practice off the air! Sending in step with our W1AW tapes and with hand key is still a fine way to cultivate sending accuracy and judgment in "spacing." All amateurs will do well to monitor their transmitters. Use the receiver with antenna off, if no monitor is available, to check that note. It is our guess that all operators in taking part in the January Novice Round-up got useful practice in self-correction of common difficulties like poor choice of speed and calling times. Only by *practice* does one develop into a good operator who can get

most enjoyment and the best results with his gear. A specific objective such as the N-R calls for powers of coordination beyond casual work, and builds operating know-how.

**DX Test in Progress.** There's a second 'phone (Mar. 11th-13th) and a second c.w. week end (Mar. 25th-27th) coming up in March in the current ARRL International DX Competition. If you weren't all set for the February period it's not too late to try your hand at DX in March; and if you got a start in February you can very well extend your score in March or maybe grab off some of the new countries that will be in there! See the announcement in January *QST* if you need details. All scores and reports will be welcomed by ARRL.

Good luck, and in making out your QSLs always be sure they are sufficiently complete in information. The date, the band, the mode, the state (for amateurs working for WAS), the report for 'phone or c.w. and the fraternal spirit they convey are all part of the great tradition guaranteed by your signature, as the man behind the key or mike.

— F.E.H.

## BRIEF

Conducting code and/or theory classes? Drop a line to Headquarters for a card to register your class schedule. This information will help many newcomers interested in obtaining their Novice licenses.

## CODE PROFICIENCY PROGRAM

Twice each month special transmissions are made to enable you to qualify for the ARRL Code Proficiency Certificate. The next qualifying run from W1AW will be made on March 15th at 2130 EST. Identical texts will be sent simultaneously by automatic transmitters on 1885, 3555, 7125, 14,100, 21,010, 52,000 and 145,600 kc. The next qualifying run from *W6OWP* only will be transmitted on March 5th at 2100 PST on 3590 and 7138 kc.

Any person may apply; neither ARRL membership nor an amateur license is required. Send copies of all qualifying runs to ARRL for grading, stating the call of the station you copied. If you qualify at one of the six speeds transmitted, 10 through 35 w.p.m., you will receive a certificate. If your initial qualification is for a speed below 35 w.p.m., you may try later for endorsement stickers.

Code-practice transmissions will be made from W1AW each evening at 2130 EST. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately 10 minutes' practice is given at each speed. References to texts used on several of the transmissions are given below. These make it possible to check your copy. For practice purposes the order of words in each line of *QST* text sometimes is reversed.

Date	Subject of Practice Text from January <i>QST</i>
Mar. 2nd:	<i>More About V.H.F. Auroral Propagation</i> , p. 11
Mar. 4th:	<i>A Cubical Quad for 20 Meters</i> , p. 21
Mar. 8th:	<i>A Discussion of Receiver Performance</i> , p. 24
Mar. 10th:	<i>A Simple Rig for Six-Meter Mobile</i> , p. 28
Mar. 14th:	<i>A One-Element Rotary for 21 Mc.</i> , p. 30
Mar. 17th:	<i>Grounded-Grid and the 304-TH</i> , p. 33
Mar. 21st:	<i>Using the 6524 Dual Tetrode on 432 Mc.</i> , p. 38
Mar. 24th:	<i>Three Stormy Sisters</i> , p. 42
Mar. 30th:	<i>September V.H.F. Party Results</i> , p. 57

## W1AW OPERATING SCHEDULE

(All times given are Eastern Standard Time)

The W1AW fall-winter operating schedule remains in effect. Master schedules showing complete W1AW operation in EST, CST or PST will be sent to anyone on request.

**Operating-Visiting Hours:**

Monday through Friday: 1500-0300 (following day).

Saturday: 1900-0230 (Sunday). Sunday: 1500-2230.

**Exceptions:** W1AW will not observe its regular hours from 0300 April 8th to 1900 April 9th.

**General Operation:** Refer to page 70, September *QST*, for a chart to determine times during which W1AW engages in general operation on various frequencies, 'phone and c.w. This schedule is still in effect but is not reproduced herewith for space considerations. Note that since the schedule is organized in EST, certain morning operating periods may fall on the evening of the previous day in western time zones. W1AW will participate in all official ARRL operating activities, using scheduled general operating periods for this purpose if necessary.

**Official ARRL Bulletin Schedule:** Bulletins containing latest information on matters of general amateur interest are transmitted on regular schedules:

**Frequencies (kc.):**

C.w.: 1885, 3555, 7125, 14,100, 21,010, 52,000, 145,600.

Phone: 1885, 3945, 7255, 14,280, 21,350, 52,000, 145,600.

Frequencies may vary slightly from round figures given; they are to assist in finding the W1AW signal, not for exact calibration purposes.

**Times:**

Sunday through Friday: 2000 by c.w., 2100 by 'phone.

Monday through Saturday: 2330 by 'phone, 2400 by c.w.

**Code Proficiency Program:** Practice transmissions are made on the above listed c.w. frequencies, starting at 2130 daily. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately ten minutes of practice is given at each speed. Code-practice transmissions will be replaced by Code Proficiency Qualifying Runs on March 15th and April 13th.

## MEET THE SCMS

Washington's SCM, Victor S. Gish, W7FIX, first became interested in amateur radio in 1912, at which time he did some spark coil experimental work, but it wasn't until 1935 that he obtained his first license.

The rigs currently in use at W7FIX's basement shack include: (1) 6L6 crystal, 807 buffer, p.p. T-10s final for 80- and 40-meter work; (2) 6AG7 VFO, 6AG7 buffer,

813 final for 80 meters; and (3) 1626 crystal, 1625 final for 160 meters. Receiving equipment consists of a BC-312, an SX-71, an SX-25, an EC-1, and Command receivers.

SCM Gish is assistant director of the Northwestern Division, as well as Route Manager, Official Relay Station, and Official Observer, and is a member of the North Seattle Amateur Radio Club. In addition he manages to find time to enjoy participation in the CD Parties. His copying speed is 35 w.p.m., for which he has been awarded a Code Proficiency certificate. Rag Chewers Club and A-1 Operator Club certificates also have been issued to him.

At the age of 17 Vic joined the Navy and in 1917-1918 installed the first bridge-controlled radio on the USS *Pennsylvania*. In 1941 he was physically retired, was recalled the next year to be placed in charge of the wire room of the 13th Naval District, and was released in 1946.

Vic's hobbies include printing *PAN News* and reading westerns and historical novels. His pet sports are baseball and football.

Each year at about this time the officers and directors of the League prepare annual reports to the Board of Directors outlining activities and progress during the previous year. This gives the Board members something to think about (as if they didn't have enough worries already!) prior to the annual meeting. Naturally, the officers' reports are longer and more comprehensive, since they have to do with the conduct of League affairs on a nation-wide day-to-day basis.

In the Communications Manager's annual report, there is always a section devoted to the status of the AREC and emergency work in general. That means us. We do not use the pronoun "us" in the editorial sense, referring to the writer. It means you and me, all of us who are responsible for the affairs and activities of the Amateur Radio Emergency Corps throughout the year and throughout the nation. Your NEC is not in any sense the director of amateur emergency affairs; he is the coordinator of those affairs, the point of consolidation at which the things you do are pinpointed and moulded into a presentable nation-wide picture. He is entirely and utterly dependent on you for the size and shape and completeness of that picture. At annual report time, it is his job to paint the picture, your job to supply the paint. Naturally, if you supply only a small amount of paint, the picture is really not a picture at all, but only a sketch.

That's the way it has been in past years. The EC Annual Report form goes out with the SET Bulletin. About ten per cent of the EC's return them. This year, we sent out a reminder card, and it paid off to the extent of bringing in a dozen or so additional reports. A good many ECs replied that they had nothing to report of any consequence. Others had mislaid the report forms. Some reported informally, not even knowing that there was a report form. Most of them never replied to the reminder card just as they had never replied to the initial receipt of the form in the first place; probably an extension of the developing negative reaction to receipt of any printed third-class mail.

We have said before and we'll say again that we would rather have a good, active EC who never reports than an inactive one who reports regularly (usually, that he is inactive). First things come first; if energetic pursuit of your function as EC does not leave the five minutes or so per month for a Form 5 report or the half hour or so per year for an annual report, then let it be so. The report of statistics is not all important, but it is quite important just the same.

Perhaps next year, instead of burying the EC Annual Report form in the SET Bulletin, we'll make it the subject of a special, later mailing. Will that help? It's too late now

to send in your Annual Report for 1954, but file away a reminder to yourself to give your SEC and Headquarters the dope on your group regularly during the coming year, and fill out that annual report form you get in the fall.

We account for the two following items not by making any lame excuses — only by saying that they were deleted from our copy for June, 1951, *QST* (which already had two

Not all of our ECs are ugly old men. Meet up with W5CNM, EC for Blaine County, Okla., who not only adds charm to our unglamorous ranks but who also, from all reports, does a whale of a good organizing job in her area. Says SEC W5KY: "I wish I had a baker's dozen of ECs cut to her pattern." Not a bad idea, eh?

full pages of material), put into a "hold" file and have just come to light. Despite their tardiness, we want these items recorded in *QST*. Apologies to W2SJV and W4SPD respectively.

On March 29, 1954 a severe snowstorm hit the Buffalo area, causing traffic jams and people to be late or unable to get home. Mobilers W2ISI, K2DVD and W2LYE, by contacting other amateurs, were not only able to get word to their own families of their predicament, but performed the same service for a great number of other motorists caught in the same traffic jams. Taking turns as NCS for the improvised net were W2a CMS and GVJ. Stations taking traffic included W2s MYN NZA UXs POM PRI ETX K2GIF, VE3DDO.

A tornado hit the Macon, Georgia, area on March 13th, 1951, taking off the roof of W4SPD's house and all his transmitting antennas. After settling his family, he went to the home of EC W4LXE and found Stubby already on the air using emergency power, with four mobiles already out searching for stricken areas. The mobiles relayed needs of victims back to W4LXE, from whence they were telephoned to the Red Cross (W4SPD is chairman of the Macon Red Cross Disaster Communications Committee). Mobiles were manned by W4s LQW JMW LXE and ZYA. W4s UJC UMN and SPD manned the kilowatt at W4LXE. W4TAZ operated his fixed station for relay work. Although fortunately all areas were available to mobile units this time, the Macon Amateur Radio Club has begun construction of a number of two-meter hand-carried units. Others active in this emergency were W4s DZL TED YWW and KL7AQJ/4.

While traveling along Skyline Boulevard about forty miles south of San Francisco, and participating in the Skyriders Net, W6WD noticed fresh skid marks on the highway. Slowing down and investigating, he discovered that a car had crashed 25 feet off the highway into a ditch — out of sight of the road — and that two ladies and an elderly gentleman were injured. W6WD broke into the net ahead of turn and apprised them of the situation. K6EER telephoned the San Mateo County sheriff and a radio ambulance and patrol car were dispatched. While the ambulance was en route, W6WD administered first aid to the injured parties. W6ANK was net control, and the entire net remained on the air until everything was well under control. Thanks to K6EER for reporting this incident.

This is precisely the sort of thing we were talking about in August *QST* last year (p. 66). K6EER suggests that amateur mobiles equip themselves with first-aid kits in order to be the more useful in such a contingency.

A tornado struck the town of Wellington, Ala., with practically no warning at about 1330 on Sunday, Dec. 5, 1954,

### NATIONAL CALLING AND EMERGENCY FREQUENCIES (kc.)

C.W.	'PHONE
3550 14,050	3875 14,225
7100 21,050	7250 21,400
28,100	29,640

During periods of communications emergency these channels will be monitored for emergency traffic. At other times, these frequencies can be used as general calling frequencies to expedite general traffic movement between amateur stations. Emergency traffic has precedence. After contact has been made the frequency should be vacated immediately to accommodate other callers.

The following are the National Calling and Emergency Frequencies for Canada: C.W. — 3535, 7050, 14,060; 'phone — 3765, 14,160, 28,250 kc.

### NATIONAL RTTY CALLING AND WORKING FREQUENCIES

3620 kc. 7140 kc.

causing 30 casualties and several hundred thousand dollars worth of damage. Amateurs in Anniston were alerted by W4BCU, who notified W4SUF and W4GCV. Organization began at 1430. SUF/m, in contact with GCV, was unable to reach the stricken area because of poor visibility. W4PJB, with W4VOQ riding with him, was the first to reach Wellington, after having difficulty getting through Highway Patrol roadblocks. Services were offered to the Highway Patrol, Red Cross and Civil Defense. W4s UHA and OAO undertook to establish contacts on 75 meters. The Alabama Emergency Net (AENP) was alerted and put on stand-by. Contact between the two nets, one on 75 and the other on 10, was maintained by landline. W4DZF/m was dispatched to a hilltop to establish contact with both PJB/m in Anniston and with control station W4GCV. From this point he acted as a relay station during the entire emergency, and also succeeded in establishing contact with W4EBD in Birmingham. At 1600 W4s SVM/m and SUF/m joined W4PJB/m in Wellington and operation settled down to routine. All traffic originating in Wellington was relayed by W4DZF/m to W4GCV in Anniston. W4YCO was assisting W4DZF/m. The Red Cross furnished casualty lists which were relayed to Wellington, Birmingham and Gadsden. W4s OZK and PAC/m operated from Padoden. Mobsiles remained at the Wellington site until about midnight, at which time they were released. Traffic was handled for the Governor, Red Cross, Anniston Fire Dept., Anniston Police Dept., State Highway Patrol, National Guard, the Birmingham News, the Anniston Star, Civil Air Patrol and Civil Defense.

— W4GCV, EC Anniston-Oxford, Ala.

Ninety-six amateurs participated in an air-raid drill held in Pittsburgh on October 25, 1954. Ninety-three stations were available. The complete Allegheny County emergency radio system was operated in accordance with RACES plans. The network operated on ten meters, and tie-in was effected with state e.d. networks operating on 75 meters. EC W3LMM reports that the distribution of all stations in the individual zones was excellent. In one zone he deliberately refrained from notifying the control station of the yellow alert, just to see what would happen. A mobile unit took over as zone control prior to the red alert, and immediately following the all-clear the regular zone control station was active. W3LMM (who is also radio officer for RACES) feels that the drill was most successful; participation increased 100 per cent over a similar drill held last June.

Tennessee civil defense conducted a statewide alert on November 7th last year, centered around Knoxville, which was "bombed." SEC W4RRV reports that the AREC gang around the state did a good job for amateur radio. Cities represented included Knoxville, Chattanooga, Nashville, Memphis, Cookeville and Oak Ridge. The Tennessee C.W. Net was also active and received high praise from e.d. officials. In fact, one newspaper quoted the Chattanooga Area Deputy Civil Defense Director as saying that the local amateurs "can offer the best communication service in that field of anywhere I have ever seen. I am amazed at their service." Nice going, Tennessee gang.

Twelve SECs reported activities for November, 1954. Total AREC membership represented was 4330. None of the twelve was new to the reported list, so the total remains at 29 sections. We also had twelve reports for November last year. Sections reporting: Los Angeles, Western New York, New York City-Long Island, Eastern Florida, Wisconsin, South Dakota, Montana, Western Florida, San Joaquin Valley, Georgia, Colorado, Alabama.

Last December the Maryland Civil Defense Control Center was honored by an inspection visit from Maryland's Governor McKeldin. The RACES installation came in for its share of interest, as shown in the picture. The operators, left to right, are W3QLF and W3IFW. Standing, left to right, are W3JE (Md. C.D. Radio Officer), Governor McKeldin and Sherley Ewing (Md. C.D. Director).

## TRAINING AIDS

If you're a member of an ARRL-affiliated club and have not seen the films available to your group, ask your club secretary to write the Communications Department for a list of current training aids. At present they include 30 films, 13 film strips, two slide collections and ten different quizzes. The demand is high but items available *now* can furnish your club with many a lively and educational evening.

## TRAFFIC TOPICS

W0KXL brings up the matter of the need for certain ending signals in traffic net operation. On QKS (Kansas Section Net) they follow a procedure by means of which any listening station who just happens to turn on his receiver or get tuned in can tell by the ending signal used by the NCS whether or not the way is open for him to QNI.

Perhaps we traffic men ought to adopt some sort of standard procedure in ending signals, since the signals adopted by ARRL after the war were adopted primarily with the needs of the DX man in mind. We hear KN used quite often in casual contact these days. The ending signal we hear most of the time, however, is AR K, which signifies nothing except that the transmitting station is ending a transmission. According to the ARRL code (Operating Aid No. 2), it would mean the station has just called another station and wishes any station to answer him. Not very logical.

W0KXL points out that ending signals should be used in net operation, otherwise the receiving station has no way of knowing when the transmission is ended. Perhaps he has a point. Most of us have run into this difficulty in our c.w. traffic nets. Here are a few examples of some ending signals that we need:

- 1) Acknowledge instructions.
- 2) Reply desired by stations concerned only.
- 3) Do not reply, or no reply necessary.
- 4) End of QTC list (used by station reporting into net).
- 5) Stations may report into net.

We're collecting suggestions on the above. Anybody have any?

-----

Miscellaneous Net Reports: (1) The Transcontinental Relay Net had a traffic count of 1622 in 31 sessions, averaging 52 per session; five stations participated. (2) The Transcontinental 'Phone Net reports 14 stations handling 827 messages. (3) North Texas-Oklahoma Net handled 531 messages in 31 sessions, 854 check-ins. (4) The Early Bird Transcontinental 'Phone Net handled 1304 messages in December, making their total 9519 for the year 1954; they count each message only once, no matter how many times relayed.

-----

United Trunk Lines announces that its directors for 1955 are W3WV, W6DDE and W9TT. Each division averaged close to 1300 messages per month in 1954.

-----

Those of you who prefer 'phone and don't mind climbing out of the hay at a rather early hour might like to have a whirl with the Early Bird Transcontinental Net. This net was formed back in the late Forties. It started as a rag-chew group, but W6BPT kept reporting in with traffic, and eventually it became a traffic net primarily. It was officially unveiled as a net on December 5, 1949, meeting three times per week on 3860 kc. The net now meets daily at (yawn!) 0145 CST under the tutelage of W0BVL, who says their slogan is "To get your traffic delivered, put it on the Early Bird. They always come through."

-----

Another transcontinental net which is trying to get started is the Transcontinental C.W. Net (TCWN). W4BMY is doing the ramrodding on this one, and trying to do on c.w. what the Early Bird Net is trying to do on 'phone — take advantage of early morning conditions to get that traffic through. TCWN meets at 0500 EST on 3690, Monday through Saturday. W4BMY says that his greatest ambition is to get a QNI from every state in the union some morning.

-----

W4UWA reports a Christmas Overflow Net operating on 3525 kc. daily at 0600 CST to handle overflow traffic during the Christmas season. This net met 11 times, handled 149 messages. It was open to all comers, and had representation from the following states: Tenn., Ill., Conn., N. Y., Ind., Ga., N. J., Nebr., Pa., Vt. and Mich. W4UWA suggests a regular NTS overflow net to operate in the mornings to handle traffic left over from the previous night's operation.

-----

National Traffic System. We quote a short but pertinent paragraph from a bulletin by W6ZRJ, manager of the Central Valley Net (NTS section-level, San Joaquin Valley and Sacramento Valley Sections): "There are three main categories of c.w. traffic men: the iron man, the one-night-a-

week man and the occasional check-in. . . . Whatever type you feel you are, we would like you to know that there is a place in NTS and CVN for you. Without iron men, long-haul work would slow down. Without many fellows who will take one or two nights a week as NCS and be there on those nights, our nets would soon start missing sessions. But without the large amount of stations who check in only once in a while we would not have enough stations to have a net each night. Everyone is needed; everyone is welcome."

Our sentiments exactly. NTS is not a system designed for one group or one type of operator; it is designed for all who wish to participate. The only requirement in participation is this: remember that NTS has all types of operators. If the presence of types different from you (faster, slower, different modes, differing opinions, etc.) irks you, it is not the fault of NTS. We don't work by ourselves; we work together. We hope you will accept this principle, because it is one most necessary for success in any organization.

### December reports:

Net	Ses-sions	Traffic	Rate	Aver-age	Repre-sentation
1RN	22*	386	0.44	17.5	86%
2RN	41	229	0.40	5.3	90

Sections**	386	3259			
Summary	892	16,192	EAN	18.0	CAN
Record	892	16,192	1.52	23.5	

\* Out of 27 sessions held

\*\* Sections reported: QKS/QKS-SS (Kans.); CN (Conn.); TLCN (Iowa); AENB & AENP (Ala.); SCN (So. Calif.); Tenn. Sectional, Tenn. Practice and Tenn. Hi-Speed; WSN (Wash.); KYN (Ky.); MSN CW & MSN Fone (Minn.).

### Late Reports:

3RN (Nov.)	31	224	0.37	7.2	88%
NCN (Calif.) (Nov.)	20	104			

We continue to topple records. December traffic on NTS topped all previous records, the nearest being last year's 14,833. Net sessions increased from last year's 607, resulting in the decrease in the average-per-session noted.

Net notes: "Skip" played havoc with 1RN in December. W3ONB would like to have someone volunteer to take over 3RN. RN5 has been handling a record-breaking amount of traffic, and W4OGG has issued several fine RN5 Bulletins; representation from Southern Texas is badly needed. VE7ASR reports bad conditions greatly hampered RN7 operations during December, and NCS often fail to report; representation needed from Saskatchewan and Alaska. TEN's early session (1700 CST) handles much more traffic than either of the others. VE3GI reports a new net, the Northland Net, now represented on TRN by VE3AVS. Four out of six regions had perfect attendance on EAN during December. W9JUI is still looking for Saturday night NCS for CAN. PAN certificates have been issued to K6BGM and W7APE.

Transcontinental Corps: All three TCC Directors are struggling to keep the TCC roster full in the face of constant turnover brought about by failure of some stations to make contact with their counterpart schedules. Erratic conditions have not helped any. In the Eastern Area there are some vacancies which can be filled by application to Eastern Area Director W8UPB. Stations that can make contact with the West Coast regularly are needed. Being able to operate rather late hours would be helpful, too. In the Central Area, W9SCA and W9BDR are running the TCC schedules almost singlehanded. Out in the Pacific Area, W6HC has had his hands full trying to keep vacancies filled. Honorable mention goes to W6ADV, W6YHM and

K0WBB. The complete TCC roster as of mid-January, 1955: Eastern Area — W1AW WIEMG W1N1M W2RUF W2ZVW W3COK W4ZFY W5DQG W8FYO VE3AJR VE3BJV VE3GI VE3TM VE3VZ. Central Area — W9JUL, W9RXD W8SCA W6BDR. Pacific Area — W4Y1P/6 W6ADB W6IPW W6QPY W6UTV W6YHM W7CCL W0BEN W0CYT W0KQD W0KHQ W0EKQ K0WBB.

 July 23rd-24th: CD QSO Party (phone)

## SUPPLEMENT TO NET DIRECTORY

The following list of nets will supplement and correct the listings on page 78, Nov. 1954 *QST*, and page 74, Jan. 1955 *QST*. Please inform us promptly of any errors or omissions so that they can be included in the final May *QST* installment. An asterisk (\*) indicates correction from previous listing; otherwise, the listing is of a net not previously included. This listing can also be used to correct and bring up to date information in the cross-indexed ARRL Net Directory, available free upon request.

Nets registered subsequent to Jan. 18, 1955, will be included in the next supplementary list, in May 1955 *QST*.

## BRIEFS

Mr. W. K. Neville, jr., Racing Chairman, First International Cup Regatta, staged October 2nd and 3rd at Elizabeth City, N. C., highly commends the Tidewater Mobile Radio Club (Norfolk, Va.) for their part in furnishing communications during the event. A number of messages were handled between the committee boat, the U. S. Coast Guard, the Pasquotank River Yacht Club, and the various pits and places of importance. Those participating included W4s YVG RGZ MLD ZKA OGN PAK IPA SVT DHZ LCW RRA ULL PWX FOU ZCY SYO JZQ IND, W6TOR and W9GLR.

A description of the 12-watt Field Day transmitter at W2NL1/2 (Dec. QST, page 46) ended up like this: "The complete station, except for batteries, was placed on a 20 by 36 foot operating table, with room to spare." As W0SGG points out, it just shows that careful planning and miniature components can produce!

## BRASS POUNDERS LEAGUE

### Winners of BPL Certificates for December Traffic:

BPL medallions (see Aug. 1954 QST, p. 64) have been awarded to the following amateurs since last month's listing: W1UKO, W3WV, W5TFB, W6CMN, W8ELW, VE3NG.

The BPL is open to all amateurs in the United States, Canada, Cuba, and U.S. possessions who report to their SCM a message total of 500 or more, or 100 or more originations-plus-deliveries for any calendar month. All messages must be handled on amateur frequencies, within 48 hours of receipt, in standard ARRL form.

• All operating amateurs are invited to report to the SCM on the first of each month, covering station activities for the preceding month. Radio Club news is also desired by SCMs for inclusion in these columns. The addresses of all SCMs will be found on page 6.

## ATLANTIC DIVISION

**EASTERN PENNSYLVANIA** — SCM, W. H. Wiand, W3BIP — SEC, 1GW, RM: AXA, PAM: PYF, E. Pa. Nets: 3610, 3850 kc. The York Road RC of Elkins Park held its Third Annual Christmas Party on Dec. 21st. An enjoyable time was had by all members and their families, with a total of 90 persons attending. SAO's XYL was chairlady of the affair. The Club's officers for '55 are SAO, pres.; VMJ, vice-pres.; UZF, treas.; YCL, rec. secy.; ULC, corr. secy. The Car-Le RC elected the following officers for '55: HA, pres.; UEU, vice-pres.; AIW, secy.-treas.; WJY, act. mgr. The Pottstown ARA elected ARK, pres.; FXX, vice-pres.; DUV, secy.; YDY, treas.; HOG, act. mgr. PYF reports the Del-Lehigh ARC set up a 50-watt 'phone rig on 3910 kc. at the bedside of K2CCN, a Lehigh University student stricken with polio and confined to the polio ward of St. Lukes Hospital in Bethlehem. WNS 3AQI and AQM, a brother team, with dad, NNV, their teacher, received their Novice tickets in December. AQI, reports dad, is now stationed at Sampson AFB and will attend radar school upon completing basic training. The Anthracite Net (AN) is looking for more members. If you have never handled traffic and would like to get started AN will give you fine experience. Listen for CQ AN Mon. through Fri. on 3610 kc. at 1900 EST. CUL reports the new home and new rig almost completed. UOE has 29 countries worked on 80 meters with 80 watts input. ARK and TYW are newly-appointed OOs, while YAZ is the first ORS appointee of '55. Traffic: (Dec.) W3CUL 8092, BFF 597, OZV 307, VVV 244, WUE 170, QLZ 162, TEJ 161, DUL 119, UKJ 107, UOE 103, RSC 98, GES 91, OK 51, GYI 42, YGX 41, ELI 14, PYY 13, ADE 6. (Nov.) W3NOK 126, GES 61, UOE 42, OK 26, PYY 15, ABT 2.

**MARYLAND-DELAWARE-DISTRICT OF COLUMBIA** — Arthur W. Plummer, W3EQK — On Mar. 21st my term of office as SCM will expire. It has been a most interesting two years and thanks to all of you who have helped to make my work satisfactory. KLA says there is increasing interest in 220 Mc. around Baltimore. RV reports completing a Heathkit 5' scope and VTVM. JE reports WBP, Md. State Civil Defense station, is on the air each Sun. from 1400 to 1600. Visitors are welcome. JZY has 60 countries confirmed out of 97 worked. Andy is using a vertical on 20 as well as on 80-meter c.w. BKE is back on the air with his well-known call (formerly QQS in D. C.). The new Baltimore Midnight Ragchewing Net meets Sat. night on 10 meters. LXG, JLY, HWZ, PRL, and SG have been heard. TMZ is on the air with a 4-125A parking, a new 140X, with DB-23 preselector, and a three-element 20-meter wide-spaced beam. CDQ participated in the YLRL Contest. QCB is now OO Class 1. UE is NCS on 3RN on Wed. in addition to NCS on MDD on Mon. and Thurs. MCG made 89,750 points in the SS Contest with a bad voltage regulator giving only half voltage. TGF popped 6 byrass condensers in his receiver. WKB has new vertical working on 80, 75, 40, and 20 meters. EEB has joined the ranks of OO Class 1. TMZ reports 67,500 points in the October CD Party. LDD, Havre de Grace, reports plans afoot to install a Viking II and a good receiver in the Sheriff's Office in Bel Air and to operate the control center from that location. RMY is going to high-power and SZY is looking for a good home receiver. 5ZOG is moving into a new shack in Aberdeen. Attention all hams in and near and passing by and through Harford County: Check in on 29,590 kc. each Mon. at 8:00 p.m. AYS's Florida vacation and a sick spell didn't hurt his score in the W-Ve Contest, for which he received a nice certificate for winning in Md.-Del.-D. C. Bayard finally made WAC on 'phone with a QSL from 4X4BL. MCG reports he is NCS for 3RN on Fri. nights. The PYRC hopes its score in the last SS beats FRC. The Oxen Hill contingency is composed of HVM, KDP, IKN, WV,

MFJ, and MCG. They all live within a radius of about 2½ miles and none of their scores were under 60,000. During Christmas week and continuing through Christmas Day holiday traffic was handled through the SCM in conjunction with Frank Cross, Director, and Robert Potts, Asst. Director, Baltimore Office USO, to service personnel anywhere in the world. Messages were filed at the USO office, delivered to EQK, who in turn relayed them to HXN, PKC, and WMX. The Washington Mobile Radio Club has a booklet for out-of-town hams visiting Washington D. C. containing all types of ham radio information. It is free by writing Ethel Smith, W3MSU, 177 Joliet Street, S. W., Washington 24, D. C. The BARC has completed the necessary paper work relative to modification of the station license from PSG to FT in memory of Meyer (Sam) Grossman, a charter member who died in 1954. FPQ is taking part in the affairs of PVRN and USWB. There is a BC-610, HRO-60, and three-element beam operating at the Army Medical Center. Walter Reed Hospital, Washington, D. C., as K3WBJ/MARS-WRAMC. WV received a BPL Medallion. NNX is renewing beam mast as the result of "Hazel" damage. CVE reports heavy traffic for December. MDD now operates at 7:15 p.m. EST on 3650 kc. HKS reports after 3 months of inactivity. RMY now has 10-meter equipment mobile and fixed. LZM talked on "Iiams and Civil Defense in Baltimore County" at the Jan. 10th meeting of the Chesapeake Club. Traffic: (Dec.) W3WV 1399, CVE 509, K3WBJ 506, W3PKC 305, UE 278, RV 205, ONB 171, COK 123, FPQ 26, WIF 23, JZY 17, JE 10, NNX 4. (Nov.) W3UE 64, JE 40, MCG 30, NNX 10, EEB 8, JZY 8, TGF 6, WSE/3 5.

**SOUTHERN NEW JERSEY** — SCM, Herbert C. Brooks, K2BG — PAM: ZI. Effective Jan. 1st, JRO became an Official Bulletin Station and K2HZR an Official Relay Station. EZM, Maple Shade, is doing FB with a new 40-meter vertical, KN2JAV and K2WAU are heard regularly on 2 meters handling Fort Dix traffic. CEH has a new beam on 2 meters. SDP edits the DX column for the SJRA. Give Bill your support and keep him informed on your DX activities. The SJRA Christmas Party was a big success. ASG reports heavy holiday traffic. Doc is quite active in MARS. ZI reports the N. J. 75-meter 'Phone Net is off to a good start this year with many new members. BAY has completed all antenna repairs and can now QSY any band from 2 to 160 meters. HX, HICR, and K2CLD have made repairs to the 20-meter beam at ZQ. The DYRA is planning an Old Timers Nite in Trenton on April 23rd. Contact ZI for details. MOM is recovering from a serious illness. ORA has just returned from California. Joe makes regular reports on OES activity and keeps us posted on the 6-meter Net that meets each Mon. at 2030. The Net has been in operation for several years. The Hamilton Twp. paper, *Scuttlebut*, reports antenna-building or changing by CEH, RLY, LSS, BDA, and K2BNE. LS and VMX are doing fine jobs as Official Observers, reporting many discrepancies. The Burlington County Radio Club meets the first Fri. of each month and operates under the call K2KED. Traffic: W2RG 231, K2HIZR 133, W2ASG 76, K2BGC 38, W2ZI 31, YRW 13.

**WESTERN NEW YORK** — SCM, Edward G. Graf, W2SJY — Asst. SCM: Jeanne Walker, 2BTB, SEC: UTH/ FRL, RM: RUF, PAMs: GSS, NAL, NYS meets on 3615 kc. at 6:30 and 3925 kc. at 7 p.m.; NYSS on 3595 kc. at 8 p.m.; NYS C.D. on 3509.5 and 3993 kc. at 9 a.m. Sun.; TCPN 2nd call area on 3970 kc. at 7 p.m.; SRPN on 3970 kc. at 10 a.m.; ISN on 3980 kc. at 3 p.m. The RARA reports plenty of new 220-Mc. equipment under construction for the V.H.F. SS. This club mails some 6,000 pieces of mail to area amateurs each year. While Secretary RUJ was hospitalized, PSD brought Bob his own Viking and VFO to help pass the time. The RAWNY ran a WAS Contest 7-day affair in January; two sections, one for Novice, one for General Class. The KBT RC had its Monti Cadlo Nite Dec. 13th. RUT just buried 500 ft. copper ground radials for a new antenna. OLH/GSB has a new VFO; operates at GSB. APH (Owego) is a new member of NYS. K2DYB requests a note from all W.N.Y. hams who would like a W.N.Y. slow-speed c.w. traffic net on 80 meters. He had fun in the SS. RQF handled the most traffic daytime. CXM (7PRZ) keeps college net skeds and a weekly sked with 7ZU and is busy with finals. EMW worked 12 countries in December with 45 watts although was busy at the Post Office. RUF, net manager, says HKA won the award for the most valuable station on the net, while BXP and OE got awards for high attendance. Traffic: (Dec.) W2RUF 1278, OE 321, K2DYB 260, DJN 150, DSF 122, W2HKA 118, ZRC 98, RQF 86, DSS 54, CXM 40, RJJ 29, WS 27, K2CUQ 20,

W2FEB 17, K2DQ 14, W2EMW 2. (Nov.) K2DYB 106, DJN 45, W2WS 32, K2DG 5.

**WESTERN PENNSYLVANIA** — SCM, R. M. Heck, W3NCD — SEC: GEG, RMs: NUG and UHN. PAMs: AER and LXK/YKD. The WPA Traffic Net meets Mon. through Fri. at 7 p.m. on 3585 kc. From KWII of the Steel City ARC we learn that MTP is interested in s.s.b. YDP is trouble-shooting the receiver with the 40-meter net gang aiding. TVB is building a super VFO. 9CWLL, ex-DNO, recently was in Pittsburgh for the wedding of his daughter. CTN has a good 40-meter signal in the west. WIIY is increasing power to 400 watts. RSL is coming back to 40 meters with a Viking. The Washington County ARC still holds code classes. VFN is leaving for the Army. KIIY is getting results with B.&W. 135 watts. SUK reports his 2200 sked each Mon. night with STY is practically 100 per cent and now he is experimenting with phase modulation p.p. 4-65As 200 watts. VEM is working out fine with home-built VFO. The Bucktail ARC now has the club station, YDWF, equipped to operate 10 meters. NGZ is having transmitter trouble. LAO's antenna blew down. IIX built the Club 10-meter converter and worked a little in the SS. TYC was busy in the SS. WII is on 40-meter c.w. RMX and PTU are 10-meter mobile. TCP still is on test equipment projects. OGN is 75-meter mobile. RLH will be on 40-meter c.w. SUL is mobile. TMA is down for repairs. The Radio Assn. of Erie news is through the courtesy of QN. MMJ shows up on 10 meters with a Viking. TMK, LKJ, TLA, and STK participated in the Christmas Parade furnishing communications. Investigating 6 meters for emergency communications use are MED, LKJ, and KJM. NKK recently joined 6-meter activity. WSO acquired his General Class ticket. QMY is back on 10 meters. VNB has left for the Air Forces. New calls are WN3APB, WN3AQU, and WN3ALF, son of YWL, all of Girard. Going from Novice to General Class is ALD. Visiting RAE was IYDM/VO4. STK reports a new code class has started at the YMCA. QMY is on 10 meters. OIE has recovered from a recent accident. The Mercer County Radio Assn. conducts code classes weekly. Fourteen-year-old ZEW reports that he and 11-year-old ZEG are active on 80- and 40-meter c.w. Traffic: (Dec.) W3W1Q 5935, LXQ 200, LMM 191, KUN 190, QPQ 140, GJY 99, UHN 61, OEZ 52, UTR 47, VRZ 20, NUG 18, SIJ 18, KNQ 8, NMJ 5, NCD 4, ZEW 3. (Nov.) W3LXQ 82.

## CENTRAL DIVISION

**ILLINOIS** — SCM, George Schreiber, W9YIX — Section Nets: ILN (c.w. 3515 kc.), IEN (phone 3940 kc.). SEC: HOA. RMs: BUK and MRQ. PAM: UQT. Cook County ECT: HPG. New officers of the Chicago Area Radio Club Council are HPG, KCW, SPT, and GME. Leading the Starved Rock Radio Club are ZEN, TV, and QLZ. The Chicago Suburban Radio Assn. elected DDP, YGF, PVE, and SDN. MRT heads the Central Illinois Radio Club. Other officers are SXL and a run off for veep between OUF and QGX, who tied. Congrats to SH and his wife on the arrival of Raymond Allen the day they bought a new home. New members of the A-1 Operators Club are LZ and HPI. New OES and OBS is PRN. JMG now is OBS; he also holds ORS and OPS appointments. Ev is continuing his experiments to see what really low power can do. He uses 15 watts. ABS now fishes for his DX from Sterling and CGP from Pontiac. Both are operators for Illinois State Police. ZSN, also a State operator, resigned to go into the service business. BRD and ROE exchange ideas on the life and habits of transmitting loops. One or the other is bound to come up soon with the apartment-dweller's dream. BPP tells us KSN is the new judge in Cumberland County. USI renewed his OBS appointment, LMC his ORS, and IAW his OPS. Winners in the Chicago Suburban Radio Assn. Sweepstakes were WFS with 106,920 points, and PBM with 15,457. Five clubs participated, with CSRA topping the list. Others were YLRL, CRTA, North Suburban, and Hamfesters. New calls heard in the section are Novices MRZ, KAM, MAJ, LSN, and LSO. The last two are the 14- and 11-year-old sons of KRH. A new call heard on ILN is NPC, whose traffic total appears for the first time at the end of this column. Brass Pounders certificates went out to DO, QQG, and AA in December. Incidentally we reported QQG's traffic total last month under QGG. Sorry, John. PVK is radio training officer for the Coast Guard auxiliary and got a nice break from the newspapers on his idea of using the extension ladders of the Chicago Fire Department for emergency antenna towers. OR and BRD also have been mentioned in the public prints in a laudatory manner. DRN reports good activity on 220 Mc. and now is trying to get a converter going on 430 Mc. as his transmitter works out OK. BA and KFX used their mobiles to provide transportation and communications for the Cerebral Palsy Drive in their home town. CLH qualified for 20-w.p.m. sticker on his Code Proficiency certificate. KJ built the kilowatt and had to hire movers to get it off the work bench and upstairs to the shack. JO is jammed with ham receivers he is servicing. The code and theory class of the Quarter Century Wireless Operators Assn. is going great guns, sparked by LZ, CYD, and EVA. The

latter makes speeches to the would-be hams on what a terrible thing a nuke is to own and operate. The class has qualified fifteen Novices in six weeks. Keep up the good work, fellows. To holders of ORS certificates, we are going through the files and cancelling out-of-date appointments. How about sending yours in for renewal? Traffic: (Dec.) W9DO 2304, QQG 538, AA 428, USA 382, YIX 131, MRQ 86, VHD 78, LMC 62, CEE 58, NPC 40, SME 39, LXJ 31, SXL 31, STZ 16, BUK 14, BA 12, CLH 9, FRP 8, VBV 5, PHE 2. (Nov.) W9QQG 98.

**INDIANA** — SCM, George H. Graue, W9BKJ — The new net manager for IFN is YEO. IFN now meets at 1730 CST because of skip. QIN is considering a change for the same reason. NTA reports for IFN, 54 sessions and a traffic total of 383. The Indianapolis Club had a display at the hobby show showing kits for Novices. MZE now is DLACT. QAV has gone mobile. BBM mobilized to Florida, likewise FMJ. Officers of the TARS are DGA, pres.; UMS, vice-pres.; OVB, secy.; and RBV, treas. LBD and WQC have gone mobile. N9LVL has a Viking II. AUS has a Viking Ranger, likewise UDD. N9LDB is new in Elwood. N9LRB is new in Alexandria. Elected officers of the LCARC are PAS, pres.; MNO, vice-pres.; KRJ, secy.; MIF, treas.; and WKN, trustee. Uent has a Viking II. EIUU is erecting a 20-meter beam. YFD has a vertical antenna. HRH is building an all-band rig. NCARA's newly-elected officers are NTI, pres.; PPD, vice-pres.; and SQW, secy.-treas. N9LJG is new in New Castle. ZSC is organizing for c.d. N9IMO took the Technician Class exams; he has erected a 32-element beam. IDT is new in Warsaw. LMM is new in Mentone. BOS acquired a General Class ticket. ZYO, ELJ, EUC, UVD, ZVS, JBQ, and VZF are on 147.3 Mc. at New Albany. HRY is the club station of the CCRC. NZZ has a commercial radiotelephone first-class license. HTC is active on 40 meters. CEA is building 2-meter portable. HLY made CP 30. DKR has a pair of 4-65As on the air. SKP is using a Windom antenna. FGX has a new VFO. KLR has 3/4 kw. on 147.3 Mc. UKG is using 300 watts with a beam on 14 Mc. Traffic: (Dec.) W9JUI 3296, NZZ 1132, TT 892, UQP 642, SNT 452, WRO 332, GEY 251, W8IQJ/9 240, W9JBQ 232, SVL 187, EHZ 159, BKJ 124, ZRP 89, TG 84, DIJ 80, AQB 77, ZYK 76, VNV 71, YQC 66, QYQ 63, WUH 60, CMT 57, YIP 48, CC 47, CEA 46, NTA 45, CPT 36, HLY 30, STC 28, EGV 25, QR 24, KDV 23, ZIB 20, YVS 14, BDP 13, EQO 12, DKR 10, NH 6, PPS 6, SKP 6, FGX 4, PQA 3, GDL 2. (Nov.) W8IQJ/9 343.

**WISCONSIN** — SCM, Reno W. Goetsch, W9RQM — SEC: OVO. PAMs: ESJ and GMY. RMs: IXA, RTP, and UNJ. Nets: BEN, 3950 kc., 6 p.m. daily; WIN, 3625 kc., 6 p.m. daily; WPN 3950 kc., 1215 Mon.-Sat., 0930 Sun. Wisconsin mobile and c.d. frequency: 29,620 kc. CXY is the proud recipient of an ARRL Traffic Medallion. SZR has 19 countries on 3.5 Mc. with EL2, KM6, ON4, and SM the latest. CCO needs 4 more states for his WAS. RQK has new 14-Mc. "Short Beam." IQW is enthusiastic about s.s.b. YNO is building a 304TTL final. With new 75A-2 and 4-125A rig, NYS worked KM6 and KL7 on 80 meters. MQK has 136 countries worked and 123 confirmed, while KKK has 133 worked and 126 confirmed. MRAC officers are MDG, pres.; NLY and EKV, vice-pres.; VBZ, secy.; JPS, treas.; ONY board chairman; and RH, SNK, LSK, CUW, DR, and MOT, directors. New certificates (WPN) were issued to BCY, CFO, PZC, HBE, NYS, OVO, and YNO. YOX is mobile on 28 Mc. W9NFHT and W9NFJW are on 144 Mc. YRO uses a 75A-2 and a 32V-2. YOS keeps working 'em with 30 watts. The Point Radio Amateurs furnished an added mobile unit for the police on New Year's Eve with BCC, NNS, CFO, GHJ, and NIT participating. RKP worked FG7, PA0, and DL1 on 3.5 Mc. Results of the Dec. 12th Wisconsin Section QSO Party: 'Phone and c.w., 1st VBZ, 2nd RQM, 3rd NYS; 'phone only, 1st OVO, 2nd QNT, 3rd NUH; c.w. only, 1st RKP, 2nd WZL, 3rd YOS; mobile, 1st ONY, 2nd TKY, 3rd LUC. W9NFJW's new jr. operator was the first baby born in 1955 in Kenosha. LEE has resumed transmission of Official Bulletins on 144.12 Mc. at 1955 West and 2000 SE. OVO has a new Heath antenna impedance meter. IJU is chief at WHKW. PBB entered military service. FXA moved to Milwaukee. Traffic: (Dec.) W9VBZ 2053, WWJ 686, CXY 362, SZR 154, IXA 118, UNJ 102, CCO 68, FXA 53, UIM 45, RTP 36, GMY 30, RQK 28, IQW 27, AEM 22, SAA 20, RQM 18, YLE 16, OVO 6, IJU 3, VKR 2. (Nov.) W9WWJ 189, CXY 45, YLE 12.

## DAKOTA DIVISION

**NORTH DAKOTA** — SCM, Earl Kirkeby, W0HNV — DAO has a new HT-20. PHH has a complete new station and is planning to change QTH. The Red River Valley Amateur Radio Club at Fargo had a "Worked All Members" Contest recently. It sounds like a very good idea. Activities like that help a lot to keep a club active. PMZ has a new 75A-3. HNR drove to Watertown Jan. 9th. He had four other hams with him which added up to half a ton of hams! Traffic: W0FVG 78, EXO 56, UXO 24, IJNV 12, BFM 5, CAQ 4, EBA 3.

**SOUTH DAKOTA** — SCM, J. W. Sikorski, W0RRN —

(Continued on page 82)

## SELECTABLE SIDEBAND RECEIVERS

NORGAARD\* and McLaughlin\*\* each have developed practical methods of switchable side band selection for receivers. Norgaard's is the phasing type and McLaughlin's employs the principle of side band selection by changing the frequency of the conversion oscillator.

SINCE both of these methods have certain electrical merits, we at Hallcrafters have spent many engineering man hours carefully evaluating the two systems for incorporation of the better features of each into our products.

WITH a receiver having poor selectance ratio in the i.f. system, i.e. poor nose to skirt ratio, the phasing scheme has some merit as it can be easily attached as an outboard device. It may improve unwanted side band rejection by as much as 35 db; but this value is hard to hold in production and from a more practical standpoint 20 to 25 db. is realistic.

IF the two systems are compared on a cost basis for incorporation in a new receiver, the phasing method does not appear attractive as better side band rejection can be obtained at less cost with good tuned circuits.

MODERN receivers of better design from \$250.00 up are dual conversion primarily to reduce image responses. Dual conversion also makes practical 50 kc. i.f. systems with excellent selectance ratio that can further be readily adjusted for various degrees of bandwidth\*\*\*. It has been known for many years that the choice of conversion oscillator frequency will invert the side bands at the i.f. frequencies. However, McLaughlin was the first to apply this principle for side band selection when using an i.f. system adjusted to pass only one side band.

WITH a highly selective dual conversion receiver like the SX-96 wherein the i.f. pass band can be reduced to pass only one side band, it becomes very simple to add effective side band selection by choice of dual conversion frequencies. As the first i.f. is 1650 kc. and the second 50 kc., the second conversion oscillator may be either 1700 kc. or 1600 kc. Thus, if we switch in the 1600 kc. we pass the lower side band, and if we switch to 1700 kc. we pass the upper side band.

BY the addition of only a quartz crystal, some switch contacts and half of a dual triode, Hallcrafters is able to provide you with good, effective, selectable side band feature at a nominal cost.

(Recent Equipment)

## 75A-4 RECEIVER

The 75A-4 offers passband tuning, AVC for Single Sideband reception, a bridged T rejection notch filter, a crystal calibrator circuit, separate detectors for double or single sideband signals, a new noise limiter circuit that works equally well on SSB, AM or CW, and mounting provision for three separate Mechanical Filters. Retained are the time-proven features of the earlier 75A series — double-conversion, crystal-controlled first injection oscillator for high stability and good image rejection; permeability tuned, sealed master oscillator with accurate dial calibration and long-term stability, and Mechanical Filters in the IF circuits for maximum selectivity.

## 32W-1 EXCITER

Designed to meet the requirements of the most discriminating Amateur whether he operates SSB, AM or CW, the 32W-1 Exciter has sufficient output power to drive a high-level power amplifier stage, and together with the 75A-4 Receiver provides the basic needs for a completely engineered Amateur radio installation. Special features of the 32W-1 are dual conversion, a permeability tuned, hermetically sealed VFO, a Single Sideband generator using the Collins Mechanical Filter to provide optimum rejection of the unwanted sideband, RF feedback to assist in reduction of distortion products, selectable sidebands, bandswitching operation on all amateur bands from 3.5 to 30 mc, VOX or push-to-talk operation, AM operation with full carrier and one sideband being transmitted, CW operation with wave shaping for minimum key clicks and transients, FSK operation by using an external audio FSK oscillator, Automatic Load Control (ALC), and unitized construction.

# *Collins* PROUDLY ANNOUNCES a NEW STANDARD in AM, CW and SSB OPERATION

It took Collins to produce the first really new Amateur communication system, designed expressly for Single Sideband as well as AM and CW operation. Collins new 75A-4 Receiver/32W-1 Exciter or 75A-4 Receiver/KWS-1 Transmitter combinations are designed for the most exacting Amateur. Engineering-wise, the equipment meets the high standards Collins has set for military and commercial equipment. Price-wise, the Amateur will get more for his money than ever before. See your nearest Collins distributor for your brochure.

## KWS-1 TRANSMITTER

Collins engineering plus extensive on-the-air tests account for the KWS-1 Transmitter's reliability and optimum performance in SSB, AM and CW operation. The exciter and RF power amplifier are housed in a single receiver size cabinet. The Collins 367A-1 linear RF power amplifier uses two 4X150A's in class AB operation. RF feedback is employed to improve the linearity characteristics of the power amplifier. The KWS-1 incorporates circuit application and components which have been proved in preceding Collins equipment; to note a few, the 70E VFO, the Pi-L output network, extremely accurate VFO dial and the Collins Mechanical Filters. To meet the Amateur's future desire for power increase, Collins 32W-1 Exciter can be modified to a KWS-1 at the factory.

# "MC" CAPACITOR . . .

## Offers Wide Choice of Characteristics!

The "MC" is a versatile single-section tuning capacitor designed to give a choice of mountings, connections and capacity characteristics. The threaded brass front-bearing and tapped aluminum end-brackets permit panel or base mounting. A rotor stop permits 180° clockwise rotation for increasing capacity. For optimum performance all Hammarlund "MC" capacitors have silver-plated beryllium copper wiping contact, silicone-treated steatite insulation, soldered nickel-plated brass rotors and stators. The rotor shaft is supported on bearings at both front and rear of capacitor. "MC's" are available with capacities ranging from 5.5 mmf. to 320 mmf.

The Hammarlund Capacitor Catalog lists the complete line of standard capacitors sold by responsible dealers from coast to coast. For your free copy, write to The Hammarlund Manufacturing Co., Inc., 460 West 34th Street, New York 1, New York. Ask for Bulletin C-3.

# HAMMARLUND

(Continued from page 78)

Asst. SCMs: Earl Shirley, 0YQR, and Martha Shirley, 0ZWL. SEC: GCP. RM: SMV. PAMs: BNA, GDE, PRL, and NEO. OOL and SDP have dropped the "N." A new Novice at Redfield is UYA. SIII is on the air from Onida. PRL and UVL have moved to new homes. RSP visited in Indiana during the holidays. NEO reports a new Elnac and Morrow FTR. The SFARC is conducting a 40-meter WAS Contest. While working on a new home, YQR fell, breaking his right arm. Bob Mitchell, ex-ISWX, and operator at KBFAL/FCR, now is FTEH and gives his QTH as Sac Zebra, SHAPE, APO 55, New York. LBS, collecting maritime mobiles on 15 meters, is up to 20. Net operations for December: 160-net, QNI, 876, 31 sessions, traffic "about 80;" c.w.-net, QNI, 90 in 14 sessions, with traffic 54; NJQ-net, QNI 520 in 18 sessions, traffic 130; evening 75-net averages QNI 34, traffic 15. SCT added 2-meter converter and Q5-er to his shack. ZIQ has a new tax deduction — a YL. Silent Key: PYP, Rapid City. Traffic: (Dec.) W0MPQ 168, SCT 106, GDE 89, NEO 63, ZWL 59, SMV 50, BNA 27, YQR 26, AYD 15, QKV 14, BQS 10, LBS 8, GWS 3, (Nov.) W0SCT 89.

**MINNESOTA** — SCM, Charles M. Bove, W0MXC — Asst. SCM: Vince Smythe, 0GGQ. SEC: GTX. RMs: KLG, DQL, and OMC. PAMs: JIE and UCV. Net time and frequencies are: Minn. Junior Net at 1800 on 3690 kc., Minn. Section Net, 1830 on 3595 kc.; Minn. Phone Nets at 1200 and 1800 on 3820 kc.; 160-Meter Net at 1830 on 1815 kc. Your SEC is to be commended for his excellent organizing of our State Emergency Corps. George's figures to date are 43 Coordinators with a count of 227 members and 182 supporting members. Join now by dropping a card to George Lord, W0GTX, P.O. Box 8, Alexandria, Minn. Looks as if this is a ladies' world. The following are active on the air: IRD, IKJ, IRJ, IXR, JAL, JML, KFN, KJZ, KMP, KZD, LPS, PYC, NNO, NQQ, OPX, OWN, RHI, TQQ, QFA, QFX, QZS, NZT, ETV, BQE, and UMK. The Minnesota Section Net gang at KJZ's house rated Becky's (ZDA) plum pudding "tops." In the last Frequency Measuring Test HKF had an average error of 2 parts per million on the 3.5- and 7-Mc. bands. On the 3.5-Mc. band he was off only .6 of a cycle. GGQ and TKX each have a new World Radio Globe King 500-watt rig. VBD has applied for a General Class ticket. OJII, trustee of the Mankato Radio Club, has applied for a station license for the Club's EC station. K6EA is now back in Sunny California. Army is trying to sell us the *Pacific Area Net* paper which is printed for net news. He is trying to have its editor include the MSN in it. GBW and HIN are in a traffic race. CGK is wiring a new Viking Adventurer. The Runestone Radio Club is printing a club album. TUS has traded his 400-watt 813 for TBS's Viking, MQA, from Grand Forks, visited in the Cities. The following are active on 220 Mc. MVP, PYC, IIPS, OFY, OFZ, OTY, OST, and PHZ. They meet at 7:00 P.M. daily. BGY is the proud father of a baby girl. Traffic: W0WMA 444, KLG 435, DQL 307, QNY 264, KNR 196, KJZ 165, K6EA 148, W0HUX 117, IRJ 103, UCV 80, QBW 76, OJH 70, QDP 62, LST 54, LUX 52, RVO 49, ABA 39, GTX 35, GGQ 32, TKX 28, EYW 26, BUO 24, NTV 23, IRD 22, MBD 22, BZG 21, OPA 21, TQQ 21, HIN 20, HNV 20, QZK 20, TUS 20, CID 17, MXC 16, FIT 15, QGD 13, PUO 10, TOK 8, K0WAA 8, W0PBI 6.

## DELTA DIVISION

**ARKANSAS** — Owen Mahaffey, W5FMF — We are sorry to hear about CAF losing part of his home by fire and more damage by water and smoke just before Christmas. VQD is the proud possessor of a new Collins receiver. A new ham in Fayetteville is WN5ED with a Globe Scout and an S-38C. He has worked 20 states. LUX lost a modulation transformer and will be off 'phone temporarily. The new RM is MSH, operating all bands with a new Lyco 600 and SX-96 receiver. He reports that RWJ is busy with his radio business days and works as a railroad telegrapher nights, which is why he is off the air. We need more slow operators on the OZK Net. See you there. Traffic: W5SXM 73, FMF 29.

**LOUISIANA** — SCM, Thomas J. Morgavi, W5FMO — FYZ, Minden EC, has a home-built phasing exciter driving an 813 s.s.b. on 75 meters. SQI spent 15 days visiting Mexico. NG, Route Manager, reports a visit by 4PL, NCS of the Hit and Bounce Net and dean of traffic men. SAY now is SWL in Venezuela. ONM finally got his antenna coupler working. He is OBS and sends bulletins Tue. at 1700 on 3870 kc., Thurs. at 1700 on 3747 kc., and Sun. at 0730 on 3905 kc. and at 0900 on 3805 kc. DUS made General Class and WQX has Extra Class license now. FMO now is operating from his new ham shack but only because of the efforts of SPZ, MIXQ, PJL, and a neighbor. They carried all the heavy equipment, swung the antennas over to the new shack and reconnected the equipment. FMO's right hand was in a plaster cast at the time. BPL was made by NDV. The Greater New Orleans Amateur Radio Club members are sporting license tags on the front of their cards with their call letters and the club name. Our heartfelt sympathy to the family of Theodore G. Deiler, who passed away Jan. 5th. As engineer-in-charge of the FCC 8th District in New Orleans, he gave many of us exams for

(Continued on page 84)

# THE HQ-140-X...

## "A Ham's Dream"

—says W4VPU

After trying out his new Hammarlund HQ-140-X receiver, Harry H. Harris, Jr., of Charlottesville, Va., W4VPU commented, "This is truly a Ham's dream."

Creating 'dream' equipment for hams is the Hammarlund goal. How well this goal has been achieved is proven by the enthusiastic comments received from satisfied Hams. They appreciate the little extras in design, circuitry and construction built into every Hammarlund product.

For example, the HQ-140-X—the amateur receiver built to professional standards—is rated XFB by Hams everywhere because of its—

**FREQUENCY STABILITY** — less than .01% frequency drift after warmup anywhere from 540 Kc. to 31 Mc.

**EXTREME SELECTIVITY** — sharp signal separation even in the most crowded bands.

**LOW NOISE LEVEL** — a noise limiter that really works.

**RUGGED CONSTRUCTION** — built for easy use for many years.

The HQ-140-X is available either as a cabinet model or for rack mounting. For complete details, write to The Hammarlund Manufacturing Co., Inc., 460 West 34th Street, New York 1, New York. Ask for Bulletin R-3.

# HAMMARLUND

SINCE 1910

## Heathkit GRID DIP METER KIT

MODEL GD-1B

**\$19.50** Ship. Wt.  
4 lbs.

with additional blank dials for individual calibration. You'll like the ready convenience and smart appearance of this kit with its baked enamel panel and crackle finish cabinet.

The invaluable instrument for all Hams. Numerous applications such as pre-tuning, neutralization, locating parasites, correcting TVI, adjusting antennas, design procedures, etc. Receiver applications include measuring C, L and Q of components—determining RF circuit resonant frequencies.

Covers 80, 40, 20, 11, 10, 6, 2, and 1½ meter Ham bands. Complete frequency coverage from 2–250 Mc, using ready-wound plug-in coils provided with the kit. Accessory coil kit, Part 341-A at \$3.00 extends low frequency range to 350 Kc. Dial correlation curves furnished.

Compact construction, one hand operation, AC transformer operated, variable sensitivity control, thumb wheel drive, and direct reading calibrations. Precalibrated dial

## Heathkit ANTENNA COUPLER KIT

The new Heathkit Antenna Coupler Model AC-1 was specifically designed to operate with the Heathkit Amateur Transmitter and will operate with any transmitter not exceeding 75 watts RF input power. Rugged design has resulted in a sturdy, well shielded unit featuring a copper plated chassis and shield compartment. Coaxial 52 ohm receptacle on the rear of the chassis connects to a three section PI-type low pass filter with a cut-off frequency of 36 Mc. Tuning network consists of a variable capacitance and tapped inductance in an impedance matching unit.

Capacity coupled neon lamp serves as a tuning indicator and will also provide a rough indication of power output.

MODEL AC-1

**\$14.50** Ship. Wt.  
4 lbs.

## Heathkit IMPEDANCE METER KIT

MODEL  
AM-1

**\$14.50** Ship. Wt.  
2 lbs.

tive null indicator. Shielded aluminum light weight cabinet. Strong self supporting antenna terminals.

The Heathkit Antenna Impedance Meter is basically a resistance type standing wave ratio bridge, with one arm a variable resistance. In this manner it is possible to measure radiation resistance and resonant frequency and antenna transmission line impedance; approximate SWR and optimum receiver input. Use it also as a monitor or as a field strength meter where high sensitivity is not required. Frequency range of the AM-1 is 0–150 Mc and range of impedance measurements 0–600 ohms. The circuit uses a 100 microampere Simpson meter as a sensi-

amateur and commercial tickets. Traffic: (Dec.) W5NDV 493, MIXQ 252, NG 140, KRX 112, EA 49, VIC 35, ONMI 2, SQI 2. (Oct.) W5KRX 80.

**MISSISSIPPI** — SCM, Dr. A. R. Cortese, W5OTD — SEC; KHB, RM: WZ, PAM: JHS. The Hurricane Net meets every night at 6 P.M. on 3935 kc. The Magnolia Net meets Sun. at 1:30 P.M. on 3870 kc. IHP is the new NCS. The Interstates Relay Net meets every morning except Sun. at 10 A.M. on 3870 kc. PFC is president of the Jackson Amateur Radio Club and OAE is secretary. The teen-age hams of Jackson have formed a c.w. net on 3734.5 kc. which meets on Sun. at 2 P.M. The Bailey Jr. High School Radio Club has been reorganized with DQL as president. MARS has reorganized the Mississippi State C.W. Net which meets daily Mon. through Fri. on 4025 kc. at 1800Z–1900Z. CSII has dropped the "N." TIR has two new 75-ft. pre-fab antenna masts. JHS still is monitoring 29.6 Mc. for mobiles. Traffic: W5VME 343, EWE 274, TIR 139.

**TENNESSEE** — SCM, Harry C. Simpson, W4SCF — SEC; RRV, PAM: PFP, RM: WQW. The Memphis Club elected CRP, pres.; GQQ, vice-pres.; STI, secy.; WTJ, treas.; VT, AFB, DCH, HHK, BAQ, and SCF, directors. ZJY is back on 'phone. The Tennessee Valley 10-meter Emergency Net now is an ARRL affiliate, as is the Clarksville Club. New ECs are BBD and TYU. TYU got a CAN certificate. A new OPS is UWA. FLW reports the Weakley County RACES Net meets Mon. at 2130 on 50.353 Mc. The Tennessee C.W. Net handled 395 QTC during December. OGG reports traffic at an all-time high on RN5. Friends will be sorry to hear of the passing of HK. While on a 7-week vacation trip to Texas and Old Mexico, PL visited W5 IGW, MN, and NG. BMI is NCS of the new c.w. practice net Tue. and Fri., 3635 kc., at 2100 CST. Flowers to PL, OGG, TJI, UWA, and ZJY for making this our best BPL month. RRV has a wonderful new idea for a Novice Emergency Net. Details when available. The Tennessee 'Phone Net averaged 32 QNI per session. High-speed c.w. handled 54 messages in a 40-minute session. Under "special stunts" WQW reports he "flew a Ford into a pole!" BBD reports 15 new AREC members. GUE has a new YL jr. operator. New Cookeville Club officers are BER, pres.; ZJY, vice-pres.; and UWA, secy.-treas. Traffic: (Dec.) W4PL 1994, OGG 1556, TJI 527, UWA 381, TYU 297, K4FET 280, W4HHI 271, SON 229, IIB 171, TZD 139, ZJY 135, SCF 117, WQW 112, PFP 83, CXY 71, BQG 60, OEZ 52, IV 46, RRV 43, PGP 41, UOA 41, PHQ 35, VJ 33, AQN 26, UVS 26, WJG 20, RHK 17, YMB 16, PAH 15, BAQ 12, BBD 8, RMJ 8, PVD 6, DCH 4, FLW 4, NPS 1. (Nov.) W4PFP 80, SGI 1, ZJY 1.

## GREAT LAKES DIVISION

**KENTUCKY** — SCM, Robert E. Fields, W4SBI — A salute to our new SEC, CDA. He relieves NBY, who has been doing an FB job as SEC but has found it necessary to give it up to further his studies in Christian work. He is starting on a World Study Tour soon. UR/1 is currently stationed at Fort Devens, Mass. HSI, ex-5FOJ, is a new ham in Kentucky and is doing an FB job with appointments as OPS and ORS. WNH is a new OES. KKW is really keeping the KYN rolling along. BAZ reports that too many errors in overseas traffic is resulting from QSP via 'phone stations. NIZ and RPF are doing some leg work in organizing some new 'phone nets for better coverage in the State. K4FBW is going strong on 2 meters with 522 transmitter and a BC-639 receiver using four-element beams stacked. YOK has bought a 500-watt rig from 9JLL and is looking for some 812As. WXL handles a lot of traffic while pursuing his studies at college. JPV again is handling long-haul traffic. SBI reports that this is the best activity report in quite a while. NIZ has been reporting station activity faithfully for some time, but for some unknown reason has been omitted from QST. I am really sorry about that for it might have been our fault. I do have a deadline to meet so, fellows, won't you please mail your reports to reach me not later than the 7th of each month. The Amateur Radio Transmuting Society (ARTS) has elected the following officers: KQI, pres.; TLU, vice-pres.; CDO, secy.-treas. Traffic: K4FBW 414, W4PXX 294, BAZ 272, KKW 235, WXL 209, SBI 160, ZLK 131, MWR 82, CDA 75, HSI 71, RPF 48, ZDB 40, WNH 37, GFG 32, JCN 32, NIZ 32, KRC 24, SZB 16, BAM 12, ZDA 11, HJQ 10, YOK 10, JU 8, UR/1 4, PAM 3.

**MICHIGAN** — SCM, Fabian T. McAllister, W8HKT — Asst. SCMs: (phone) Bob Cooper, 8AQ4; (c.w.) Joe Beljan, 8SCW. SEC: GJIL. EMD is now OO Class III and IV. Many thanks for all of the holiday greetings received from the gang. BPL cards went to QAH, NUL, NOH, SWG, and WNO for December traffic. SWG says it was the best month in his entire ham career, and RTN is enjoying his best traffic season. Our congratulations to the QQOs, whose new 8th harmonic was heard overmodulating on all bands Dec. 31st. Doc says the feedline now has a standing wave ratio of three to five, in favor of the girls! New officers of the Edison Amateur Radio Assn. are PKA, pres.; WEL, vice-pres.; CYJ, act. mgr.; ILP, secy.-treas. HSG spent the holidays traveling through the South, and had a three-day visit with 4PL. "There," says Cos, "is a

# \$1950

Here is the new Heathkit VFO you have been waiting for. The perfect companion to the Heathkit Model transmitter. It has sufficient output to any multi-stage transmitter of modern A terrific combination of outstanding at a low kit price. Good mechanical

and electrical design insures operating stability. Coils are wound on heavy duty ceramic forms, using Litz or double cellulose wire coated with polystyrene cement. Variable capacitor is of differential type construction, especially designed for maximum bandspread and features ceramic insulation and double bearings.

This kit is furnished with a carefully precalibrated dial which provides well over two feet of calibrated dial scale. Smooth acting vernier reduction drive insures easy tuning and zero beating. Power requirements 6.3 volts AC at .45 amperes and 250 volts DC at 15 mills. Just plug it into the power receptacle provided on the rear of the AT-1 Transmitter Kit. The VFO coaxial output cable terminates in plastic plug to fit standard  $\frac{1}{2}$ " crystal holder. Construction is simple and wiring is easy.

- Smooth acting illuminated and precalibrated dial.
- 6AU6 electron coupled Clapp oscillator and OAZ voltage regulator.
- 10 Volt average output on fundamental frequencies.
- 7 Band calibration, 160 through 10 meters, from 3 basic oscillator frequencies.

Open layout.—  
easy to build  
— simplified  
wiring.

Smooth acting  
illuminated  
dial drive.

Clean  
appearance  
— rugged  
construction —  
accessible  
calibrating  
adjustments.

Ceramic coil  
forms —  
differential  
condenser.

Copper plated chassis—careful shielding.

**\$2950**

**SPECIFICATIONS:**

Range 80, 40, 20, 15, 11, 10 meters.  
6AG7 ..... Oscillator-multiplier.  
6L6 ..... Amplifier-doubler.

## a new concept in linears

CENTRAL ELECTRONICS takes pride in presenting a product of intensive research — the new Multiphase 600L Broad-band\* Linear. "It is destined to change the entire concept of RF amplifier design in the military, commercial and amateur fields." There are no tuning controls, servos or moving parts other than band-switch.

- Single 813 in Class AB<sub>2</sub>.
- New band-pass couplers provide high linear efficiency: 60 to 65%.
- Designed for 50 — 70 ohm co-axial input and output.
- Easy to drive — Approx. 2 watts effective or 4 watts peak drive power required for 500 watts DC input.
- Built-in power supply — bias and screen regulation, 45 mfd. oil filled paper output capacitor. Excellent static and dynamic regulation.
- Extremely low intermodulation distortion.
- Automatic relay protects 813 and RF couplers.
- Excellent stability — complete freedom from parasites.
- Effectively TVI suppressed — RF compartments thoroughly shielded and Hypassed.
- Choice of grey table model, grey or black wrinkle finish rack model.
- Table model cabinet size — 14 $\frac{5}{8}$ " W, 8 $\frac{3}{4}$ " H, 13" D.

**MULTIPHASE**

Chicago 13, Illinois

Watch for early announcement of other new  
**CENTRAL ELECTRONICS**  
equipment.

**MODEL 20A**

**MULTIPHASE EQUIPMENT** is the overwhelming choice of SSB OPS everywhere. Ask any ham who uses it! Listen to it perform on SSB, AM, PM or CW!

### MODEL 20A

- 20 Watts Peak Power Output SSB, AM, PM and CW
- Completely Bandswitched 160 thru 10 Meters
- Magic Eye Carrier Null and Peak Modulation Indicator

Choice of grey table model, grey or black wrinkle finish rack model.

Wired and tested.....\$249.50  
Complete kit.....\$199.50

### SIDE BAND SLICER

#### MODEL A IMPROVES ANY RECEIVER

Upper or lower sideband reception of SSB, AM, PM and CW at the flip of a switch. Cuts QRM in half. Exalted carrier method eliminates distortion caused by selective fading. Easily connected into any receiver having 450-500 KC IF. Built-in power supply. Reduces or eliminates interference from 15 KC TV receiver sweep harmonics.

Wired and tested.....\$74.50  
Complete kit.....\$49.50

### Check These Features NOW IN BOTH MODELS

- **Perfect Voice-Controlled Break-in** on SSB, AM, PM.
- **Upper or Lower Sideband** at the flip of a switch.
- **New Carrier Level Control.** Insert any amount of carrier without disturbing carrier suppression adjustments.
- **New Calibrate Circuit.** Simply talk yourself exactly on frequency as you set your VFO. Calibrate signal level adjustable from zero to full output.
- **New AF Input Jack.** For oscillator or phone patch.
- **CW Break-in Operation.**
- **New Gold Contact Voice Control Relay.** Extra contacts for muting receiver, operating relays, etc.
- **Accessory Power Socket.** Furnishes blocking bias for linear amplifier and voltage for optional VFO (Modified BC458 makes an excellent multiband VFO).
- **40 DB or More Suppression** of unwanted sideband.

### MODEL 10B

#### SUCCESSOR TO THE POPULAR MODEL 10A

- 10 Watts Peak Power Output SSB, AM, PM and CW
- **Multiband Operation** using plug-in coils.

Choice of grey table model, grey or black wrinkle finish rack model. With coils for one band.

Wired and tested.....\$179.50  
Complete kit.....\$129.50

### QT-1 ANTI-TRIP UNIT

Perfect Voice Operated Break-in with loudspeaker. Prevents loud signals, heterodynes and static from tripping the voice break-in circuit. All electronic — no relays. Plugs into socket inside 20A or 10B Exciter.

Wired and tested, with tube....\$12.50

### AP-1 ADAPTER

Plug-in IF stage — used with Slicer, allows receiver to be switched back to normal.

Wired and tested, with tube.....\$8.50

### NEW AP-2 ADAPTER

Combined AP-1 and xtal mixer. Allows Slicer to be used with receivers having 50, 85, 100, 915KC and other IF systems. One xtal suffices for most receivers.

\$17.50

(Continued from page 84)

great guy and a grand gentleman." He has three rigs (kw, each) which he usually runs at 160 to 350 watts, has been on the air for 25 years, and has never worked a minute of phone. ILP's nineteen-year-old daughter was taken to the hospital for an emergency operation on Christmas Day but is now OK. JKK is buying a new house and the moving and reinstallation work may keep him off the air for a couple of months. WJO operated his station in a booth at a Crafts Exhibition and ran up some nice traffic totals. MRL sold the HT-20 and Matchbox and now runs 650 watts 'phone and 850 watts c.w. to a BC-610E. NEJ finally moved into the new quarters at the Gamie Refuge and now boasts of a 3½-wave antenna on 75 meters bunched to the top of a 100-ft. fire tower. DAP wants information on the Great Lakes Net. Anyone got it? NDG is a newcomer to both QMN and THN and says he enjoys both. By the way, any of you fellows who are home at noon are missing out on lots of traffic on THN, 3663 kc. every day at noon, if you haven't checked in. The first official meeting of the new Holland Area Radio Club was held Dec. 9th in the Red Cross Office at Holland. Officers elected were GCW, pres.; and NYA, secy.-treas. Traffic: (Dec.) WSOAQ 512, NUL 509, NOH 463, ILP 306, SWG 250, RTN 236, JKN 160, ZLK 144, WVL 139, WJO 122, QIN 109, URM 102, PHA 91, FX 79, DSE 76, MRL 69, INF 47, AUD 43, NEK 40, IV 38, DAP 30, NDG 25, OQH 24, OT 23, DLZ 18, PHM 15, HKT 14, TBP 12, MEX 8, ZHB 8, EGI 6, (Nov.) WSRTN 208, PHA 94, QOQ 34, NEJ 26, TBP 21, PDF 12, PHM 2.

**OHIO** — SCM, John E. Siringir, W8AJW — Asst. SCMs: J. C. Erickson, SDAE; W. B. Davis, 8JNF; and O. V. Bonnet, SOVG. SEC: UPB. RMs: DAE and FYO. PAMs: EQN and HUX. BPLs were plentiful for December as ARO, FYO and RO each qualified for the third and last leg of their BPL medallion awards. IJNP and QHW each made his first BPL award. New appointees are SÖL as EC, IVE as OBS, and VTF as ORS. A regrettable typographical error appeared in January QST. It was GL who passed away and not DL. New West Park Radiop officers are ZEU, pres.; OPX, secy.-treas.; FRB and AGA, trustees. AJH reports that IFZ has been the stand-out mobile in the Cleveland Area transmitter hunts. GZ claims 105 countries on s.s.b.c. SPU has worked about 200 mobile stations. OSD is working portable in Delaware, Ohio. WE's NYL, OTK, has received her General Class license and is trying for her last eight states for WAS. ROX made 407 FD contacts with 30 watts and an indoor antenna. ZAU is operating portable in New Mexico during February. GDQ worked LU3EL, YV5DE, and VP4LZ on 160 meters, along with a couple of Gs and a VO. DSX, mgr. of SRN, reports Ohio was represented 40 times during December. An additional December appointment was OES for KQY. HHF, Acting EC for Lucas County, reports that NBD was the winning mobile in the December 160-meter hidden transmitter hunt. Novices RSJ and RTA are twin brothers in Canal Winchester. WNSRCG took his General Class exam in December. TPM is ex-ØASE. The Dayton RF Carrier reports that new DARA officers are GQ, pres.; RCA, vice-pres.; MDK, secy.; DHJ, treas.; OVG and ZOF, board members. The DARA Christmas Party was held Dec. 18th at the Albatross Club. FPH handles the Monday C.D. Net and the Patterson High Radio Club has elected KQY as president. The GCARA *Mike and Key* tells us beginners' code classes are held on Tue. at 7:30 p.m. and theory classes follow at 8:30. Cincy's OVARA *Ether Waves* states that the Club 88 score list pretty close to 1,800,000 points. Springfield's Q-5 reports that new officers are WXX, pres.; KQW, vice-pres.; DCJ, secy.; OKB, treas.; and ENS, editor. The FHARA *News Bulletin* mentions that new amateurs in the area are PNZ and QJH; the IUVs have acquired a brand-new baby daughter, and IZT has taken over as Hamilton's leading DX man. The Columbus *Carascope* informs us that RHY lost his one and only appendix; MRC and OMY are knocking off a bit of rare DX; and the Club's Christmas Party produced a husky and happy turnout. Toledo's *Shack Gossip*, edited by those lovely ladies HUX and HWX, relates that YAZ and VQP have moved to 2 meters. NBO and PXO have started on 160 meters. 9YEL was the first W9 to receive the WTO Award. JOR has a new 44-ft. vertical. MBE has returned to c.w., and ERII has become reactivated. Eastern Ohio *Ham Flashes* reports that NYZ has moved to California; TTQ and TTX are new Novices in Hubbard; EK is Radio Officer for Area 3 Control Center, while DUX is his assistant; NDB is president of Warren Harding High's radio club; NXX has procured a Viking II; and GST has moved from Youngstown to Canfield. Those Dayton F.M.T. wizards, HB, YCP, CUJ, and GQ, again topped the Ohio section. Traffic: (Dec.) W8FYO 994, ARO 926, QIHW 562, DAE 381, FPZ 338, LHV 224, RO 221, IJNP 217, IFX 151, AMH 144, MQQ 141, DG 83, AL 78, SRF 58, LMB 43, GDQ 38, LZE 37, AJW 36, GZ 34, IHF 24, BEW 22, QIE 20, TLW 20, ROX 19, KIH 16, EQN 13, AHI 12, WAV 12, HUX 10, WE 10, CRA 8, NQO 8, AEU 7, MGC 7, DL 6, ET 6, HFE 6, PBX 6, BLS 5, CSN 5, DMD 5, IIFR 4, IAY 4, OQP 4, WJB 4, TJD 3, AYR 2, HPP 2, KDY 2, KXN 2, LER 2, LVW 2, WYL 2, BZD 1, PM 1, (Nov.) ## HUDSON DIVISION

**EASTERN NEW YORK** — SCM, Stephen J. Neason, W2LJL — SEC: RTE, RM: TYC, PAMs: GD1D and JIG. It gives me pleasure to announce the appointment of LEL as Asst. SEC. Don is well qualified for the post and will be of much help to RTE, our very busy SEC. QGV has a converted AP-13 going on 430 Mc. Newly-elected officers of the SARA are YIV, pres.; ZBY, vice-pres.; GRI, secy.; K2HON, treas.; NZE, K2AXY, and K2CKS, directors. GFH and BKW are on the sick list. We hope for a speedy recovery. APF and family are touring Europe by air. K2BKU has an 813 final going on 3.5 and 7 Mc. WWK is the new EC for Schenectady County. Frank also is NCS for the Schenectady AREC Net each Sun. at 1400 on 3925 kc. K2BSD handled stacks of Christmas traffic. GYV moved to a new QTH in the Town of Colonie with enough room for stacked rhombics, he says. YIK moved to Syracuse recently. RMM has the s.s.b. fever. He is testing a newly-designed s.s.b. exciter. KN2JTY, manager of the MIT Net, urges all Novices to be sure and call in on 3716 kc. each Sun. at 1300. If you don't have a crystal, drop Pete a line. K2ANL has 120 watts on 29-Mc. mobile. K2EOM is Acting RO for Peekskill. KN2HQW has a new sixteen-element beam on 144 Mc. ILI is the new RO for Dutchess County. K2EHI was awarded a Section Net certificate for activity on NYSEPN. K2GCH works DX on 144 Mc. with the family TV antenna. The IBM Club Christmas Party was an FB affair with many visitors present, including 20 from Peekskill. Gifts were exchanged, prizes were awarded, and refreshments topped off the evening. Please check your appointment expiration date now. Traffic: (Dec.) K2EQD 41, EHI 26, (Nov.) K2BJS 244, EOQ 32, BE 30, W2GDD 27, K2EHI 26, W2LRW 26.

**NEW YORK CITY AND LONG ISLAND** — Carleton L. Coleman, W2YBT — Asst. SCM: Harry J. Dannels, 2TUK. SEC: ZAI. PAM: JZX. RMs: VNJ and LPJ. ZAI reports AREC activity at its peak with successful drills held by the Staten Island and Brooklyn groups. Nassau EC, FI, lists more than 56 stations reporting weekly on the Mon. evening 144-Mc. net, with an additional 28 stations active on Thurs. evening on 10 meters. A busy December was had by the section's traffic gang with a record total of 10 BPL winners. Note KEB's total of 2097, followed by OM, KFY, and LPJ's fine total, and JOA's one-week BPL effort while enjoying college holidays. K2CQP is the new manager of TAN. VNJ's son now is KN2KLC. BO now is using a two-element beam on a 40-ft. pole for 14-Mc. overseas traffic. AEE, with three traffic-handlers, made BPL K2ABW and his Dad, IHE, finished the 250-watt which was Army's Christmas present. K2IHD is building a radio-controlled airplane. DSC has a Collins Auto-tune KW. New officers of the Lake Success RC are CWD, pres.; DLO, vice-pres.; and QAN, secy. BMK received WAS and is planning 75-meter operation. LGK reports the Tuboro Club still is awarding a certificate to any station working 5 members. New Tuboro Club officers are AZY, pres.; END, vice-pres.; LGK, secy.; MES, treas.; and IAG, financial secy. K2DET is mobile with Stancor and broad-band converter. JBP returned from Guam and then left to work in W6-Land. K2s HYK and JEB are new ORS. Officers of the Levittown RC for the new year are AEV, pres.; K2GXL, vice-pres.; JUN, secy.; and K2CFB, treas. The North Shore RC plans an s.s.b. net for the high end of 20 meters. GDL is on s.s.b. with 10A and 807s. K2AMP now is handling traffic with the NLI Net. K2GXL and his XYL, KN2IBH, are active on 144 Mc. JZX now is an honorary member of the Broadhollow RC. K2KIX, formerly the Republic Aviation RC. New officers of the L. I. unit of the YLRL are KN2EBU, pres.; KAE, vice-pres.; K2CFF, secy.; JZX, treas.; and UXM and KN2JHQ, trustee. The Fordham RC is giving classes in radio theory at 7 p.m. on the 1st and 3rd Fri. The Northern Nassau RC has elected the following officers for '55: CJY, pres.; CNN, vice-pres.; YML, rec. secy.; DUO, corr. secy.; and ADO, treas. YHP increased 144-Mc. power from 1 to 15 watts in preparation for the V.H.F. Sweepstakes. K2HYK is increasing power on 80 meters to 45 watts. EEN has been active in all contests since returning to the air. K2AMM is building 144-Mc. receivers. The Hudson Division Convention, under the sponsorship of the FLIRC, is scheduled for June at Long Beach with K2EP acting as chairman. Wantagh RC officers are UGO, pres.; ELK, vice-pres.; and K2DRD, secy. GYL has added a new SX-88 for DX hunting. RB has a Johnson Viking II and VFO. GG is planning some aero-mobile operation for summer. K2HML has moved to New York City. On Nov. 27th meetings of the ACARC and the College Net were held in New York City. Twelve different colleges were represented at the College Net meeting. This Net meets on 3895 kc. Thurs. at 1600 and Fri. at 1515. Please continue mailing reports to TUK. Traffic: (Dec.) W2KEB 2097, KFY 1608, LPJ 1025, VNJ 912, BO 828, K2CQP 775, W2JOA 706, AEE 466, MUM 276, JGV 223, K2ABW 151, W2JZX 139, K2AMP 112, W2IHE 84, K2CRH 69, W2IVS 48, OME 46, K2HID 32, W2DSC 31, GP 31, IN 20, K2CMV 20, W2LGK 14, PF 14, OBU 13, TUK 5, K2AED 4, HYK 4, W2OKU 3, MDM 1, K2GZE 1, (Nov.) # Thanks for that 5 by 9 plus, Algiers!

## WE'RE USING A VIKING II HERE!

THIS IS A SWELL LAYOUT, PETE. WISH I COULD MOVE MY SHACK OUT OF THE BASEMENT.

GEORGE, WHY DON'T YOU UNSCRAMBLE YOURSELF FROM THAT "HAYWIRE" AND BUILD UP A PROFESSIONAL LOOKING

VIKING II LIKE MINE? I REALLY SHOULD. THAT VIKING HAS EVERYTHING I WANT. ITS BANDSWITCHING WITH PLENTY OF POWER, TOO!

YOU COULD PUT A NEAT LOOKING STATION LIKE THIS IN OUR DEN, TOO!

THIS IS THE WORLD FAMOUS VIKING II...THE CHOICE OF JUST ABOUT ONE OUT OF EVERY FOUR AMATEURS.

THAT'S WHAT I WANT. IT'S PROFESSIONAL IN APPEARANCE AND DESIGN AND IT'S PACKED WITH FEATURES.

LIKE? I'M REALLY SOLD ON THE VIKING'S PERFORMANCE!

GEORGE, IT'S GREAT!! I SEE YOU TOOK MY ADVICE AND GOT A VIKING VFO, ALSO.

AND EVEN IN THE SAME ROOM WE NEVER HAVE TELEVISION INTERFERENCE.

BOY! THIS KIT IS SURE COMPLETE! IT INCLUDES EVERYTHING FROM THE WIRING HARNESS TO THE PUNCHED CHASSIS...AND THOSE STEP-BY-STEP INSTRUCTION PICTURES

...AND IT CERTAINLY WAS ECONOMICAL, TOO!!

MAKE IT A CINCH TO WIRE.

### VIKING II TRANSMITTER KIT

- 10 Thru 160 Meters
- 180 Watts CW Input
- 150 Watts Phone Input

Available wired and tested, with tubes . . . or as a complete kit, the Viking II is today's most popular amateur transmitter.

Cat. No. 240-102. Complete with tubes, less crystals, key and mike. **\$279.50**

## MIDGET ALL-PURPOSE POWER RELAYS BY DOW

Model DKP

... a new class of relay  
for Radio and Industry

**DKP**

This new midget power relay combines features of midget open type relays and the rugged power types, ideal for small space.

Silent as a DC relay, rated at 25 amps non-inductive load at 110 V... mounts easily under a 1½" chassis... carefully engineered for control circuits, motor starting... quiet, rugged... linkage and lost motion eliminated by direct magnet thrust... this versatile relay solves mounting problems; easily changed mounting foot allows combinations for chassis, bank or rack mountings... heavy leaf springs and 3/16" coin silver contacts with operate time of 2 to 5 milliseconds put the DOW Midget All-Purpose Power Relay in class by itself.

**THE DOW-KEY CO., Inc.**  
WARREN, MINNESOTA

**NORTHERN NEW JERSEY**—SCM, Lloyd H. Manamon, W2VQR—Asst. SCM: Charles Teeters, K2DHE. SEC: IIN, PAM: CCS, RMs: EAS, CGG, and NKD. CFB is building a pulse transmitter for the 3500-Mc. band. The Irvington Radio Amateur Club is conducting code and theory classes the 2nd and 4th Mon. of the month for Novice and General Class tickets. Classes are under the direction of WFK. Prospective hams in the area are invited to attend these classes at the club rooms in the Irvington Community Bldg. HXP is working on RACES projects. K2CHI is experimenting on new antennas. K2BWQ has received his second MARS citation for exceptional participation for the month of November. His daughter Barbara, K2CLC (AA2CLC), age 16, became the youngest MARS member in the U. S. on her birthday Dec. 9th. Barbara and her dad now become the first father/daughter team to be registered in MARS work. EAS has been away from the home QTH for the past two months in connection with his work with United Air Lines in the communications field. NYI has received BERTA certificate. HXU is having his troubles with TVI. VYB was home on leave over the holidays. KBO has been laid up in the hospital for some time. We all wish you a speedy recovery. OM, K2GBP is building a new base station now that the mobile transmitter is in good shape. K2EKO and GRU are busy chasing DX. BRC is on low power on 20 meters while the new rig is being built. The Windblowers VHF Society held a hobby party at the home of NUL. K2EDQ is a new OO. K2DSW is temporarily QRL because of attending school at ICA. However, during the holidays he had a few minutes spare time and ran up a traffic total of 411. K2GAS is a new OITS. K2EUN made BPL for the first time. KN2JOM has moved to North Brunswick. K2BAY confesses he never should have monkeyed with his sky wire. As a result his heaters have not been warm since Nov. 17th. K2BWQ has added a new tape recorder to his station. The Livingston Amateur Radio Club is sponsoring a building program on s.s.b. excitors. Much credit to the promotion of s.s.b. activity within the club is due JCCU (ex-2NJR) and 2ICA. The s.s.b. group shortly will conduct an on-the-air net on 75 meters. Currently active on s.s.b. are BWN, CCF, COT, GBT, ICA, IID, NRQ, and ORX. Annie, the YL operator at K2ICE, has acquired the name of "Hurricane Annie." Thus stemmed the new Hurricane Net in Monmouth County, which meets nightly, with Annie at the helm, on 144 Mc. K2HNA is heard on the air from K2DHE's QTH. ENM is the proud possessor of a new 4-230A all-band final. NIE has a unique omni-directional 144-Mc. beam. This all happened when the brake failed on the Gordon Rotator. We think the beam still is spinning atop the 100-ft. tower. FC is heard regularly on 144 Mc. with his new Gonset. OUS is mobile on 144 Mc. all over the county. Tune in any time and you will hear him on the road combining business with a little hamming. K2CTL is building a new mini-beam for 14 Mc. Traffic: (Dec.) K2EUN 602, DSW 411, W2CQB 331, K2GAS 329, W2EAS 171, K2GFX 118, W2FPM 56, K2BWQ 41, W2CJX 14, K2CHI 6, GER 6, KN2JOM 6, W2NYI 6, IIXP 5, CVW 1. (Nov.) W2EAS 123, K2CHI 4, W2CFB 4.

## MIDWEST DIVISION

**IOWA**—SCM, William G. Davis, W0PP—Iowa ended 1954 with the most reports to the SCM and, I believe, the biggest traffic total since I have been SCM. SCA earns his 48th BPL with his biggest month. Doc has been disabled from a fall while fixing his antenna. I must award 4 BPLs this month and a near miss by CZ. QVA reports: YBK has rejoined TLCN, UTD is a new member of the Net. DDV is our new SEC, succeeding VLA. HMM climaxed his class by giving the exams to 9 students, ranging in age from 10 to 60 years. QVA gave the Novice Class test to a 13-year-old Burlington lad. VYH has gone to I.S.C. for the spring term. Section Net certificates were awarded to KVJ and LCG, the latter a YL. LJJ reports for the Muscatine Club: BGN is on 2 meters. VLD worked 16 states on 2 meters with 5 watts. LIG has returned from TV school in Chicago. LJW is reporting from Davenport. HMM's radio class is doing very well. CGY continues his DX on 80-meter c.w., including Midway I. RKT and FIE are going great guns on mobile. LJW reports December was his best month for traffic. He's using a vertical antenna. Santa brought BLH a new Johnson Match Box which he intends to use on a 40-meter vertical. The Waterloo Club threw a Christmas Party for the XYLS. BBZ was home on leave but is back on the USS Rochester. It is now time to think of your nominations for SCM. Please consider carefully and get your nominations in. I will not be able to accept again because of a change in my work status. Traffic: W0SCA 3271, BDR 3156, PZO 931, LCX 766, CZ 419, LJW 224, QVA 86, BLH 78, KVJ 67, NGS 34, RMG 26, HWU 13, DDV 12, NYX 12.

**KANSAS**—SCM, Earl N. Johnston, W0ICV—SEC: PAH. RM: KXL/NYI. PAM: FNS. A new club known as the Wheat Belt Radio Club, with headquarters at Herndon, Kans., was formed Dec. 12th with 19 licensed amateurs; 20 XYLS, jr. operators; etc.; and 3 SWLs attending. Officers are UOL, pres.; QHE, vice-pres.; FVD, secy.; KDW, treas.; UTO, activities and entertainment. The KVRG of Topeka

T-90 Bandmaster Transmitter

R-9 Bandmaster Receiver

APS-90 Power Supply  
115 V. A.C.

VPS-T90  
Mobile Power Supply

Speaker for  
Fixed Station Operation

Speaker for  
Mobile Operation

Here at Harvey-Wells, we make communications systems for military and commercial applications, and we believe that Hams too, want their stations complete in every respect. That's the basic thinking behind this new equipment we are introducing. The tremendous success of our TBS-50 Bandmaster has been due in part to the fact that it can be put on the air quickly and efficiently because it is a complete "package" with no additional equipment necessary.

Our new T-90 Bandmaster Transmitter is also a complete "package". It can be on the air five minutes after you bring it home if you so desire, just plug in the power supply and connect the antenna. Our new R-9 Bandmaster Receiver, in its matching case, becomes an integral part by simply connecting the antenna to the T-90.

For fixed station operation, we offer the APS-90 A.C. Power Supply in a cabinet to match. (Just connect to 115V A.C., plug the output cable in the rear of the T-90 and you are ready to go.) The R-9 Bandmaster Receiver has a built-in A.C. supply. For mobile operation we have two vibrator power supplies, the VPS-T90 for the transmitter, and the VPS-R9 for the receiver. Both are convertible for 6 or 12 V operation.

Speakers for either fixed or mobile operation are matched electrically and physically to the R-9 Bandmaster Receiver to complete the system. This new Bandmaster Series is a complete system, engineered for fixed, mobile or portable operation — a system which has beauty as well as efficiency. It's well worth waiting for.

P.S. We are still making the world-famous TBS-50 too!

MODEL

**PRECISION-Engineered in response to the demand for a low cost, FACTORY-wired FACTORY-calibrated and FACTORY-guaranteed 'scope . . . the new ES-520 fills an important need for every well-equipped ham shack.**

## SPECIFICATIONS INCLUDE:

- ★ Push-Pull vertical drive. 20 mv. per inch sensitivity.
- ★ 3-Step, frequency-compensated, vertical input attenuator
- ★ Vertical freq. response 20 cycles to 500 KC within 2 DB.
- ★ 1 volt, peak-to-peak, built-in vertical voltage calibrator.
- ★ Excellent vertical square wave response from 20 cycles to 50 kilocycles.
- ★ Push-pull horizontal drive. 50 mv. per inch sensitivity.
- ★ Horizontal frequency response 20 cps to 200 KC within 3 DB (at full gain).
- ★ Internal linear sweep 10 cycles to 30 kilocycles.
- ★ Negative and positive sweep synch selection

**Plus** additional engineering and performance features never before incorporated in an oscillograph designed for general application and at such an economical price.

**SERIES ES-520:** In black ripple finished steel cabinet 8 1/4 x 14 1/2 x 16 1/2". Complete with all tubes, including 50P1 CR tube. Comprehensive instruction manual.

Net Price: \$127.50

held its annual banquet and election of officers Jan. 7th at Lake Linge, choosing KKF, pres.; JLY, vice-pres. and treas.; and UPU, secy. W09YPK and his XYL, YPL, new in Colby, have a Viking Adventurer and an NC-88. FSE has a new Eldico electronic key to help with his traffic-handling. NFX has time for DX as well as traffic-handling. UWV and GDH, of KCK, have new Viking Rangers, as does GTU and ICV, of Topeka. GDH has been QSOing friends he visited in the Caribbean last year. MOX has completed 150-watt final for 6 and 2 meters. SIK, of Topeka, is a newcomer on 2 meters with 15 watts to a 2E26. YUH, of KCK, now in Lawrence, is a new 2-meter station there. The KVCRC's debut on WIBW-TV brought in lots of fan mail and requests for additional shows on amateur radio, which will be given about every six weeks on different phases of our hobby. YJU is YFE's week-day station in Ottawa. BLL, NTV and SIG made BPL Traffic: W0BLI 1320, NTV 480, SIG 223, UAT 172, MXG 163, FSE 151, EOT 97, BET 96, TOL 90, ABJ 78, UNV 58, SVE 53, WXT 41, VZM 40, FBV 39, FDJ 30, KSY 30, ECD 27, TNA 27, NFX 26, LBJ 22, REP 18, LOW 17, ONF 17, VBQ 17, YJU 17, KAJ 13, SBL 10, LIX 9, SAF 8, DEL 6, QMU 6, YFE 6, ICV 4, LQX 4, MLG 2, RXM 2, VGE 2.

**MISSOURI** — SCM, Clarence L. Arundale, W0GBJ — SEC: VRF, PAM: BVL, RM: OUD and QXO. New officers of the Ferguson High School Radio Club are RUK, pres.; TGD, vice-pres.; PWN, secy.; PWO, trustee. SMARC elected NHO, pres.; FGS, vice-pres.; PDR, secy.; BPD, treas.; and QWS, act. mgr. The HARC elected the following officers: NDS, pres.; HJC, vice-pres.; RDI, secy.; and TLV, treas. 9CXI has retired from the Army and is located in Springfield. FLN has installed a 10-20-meter beam, and is conducting code and theory classes for prospective hams. SAK has acquired an NC-173. TGC has a new 10-meter beam. TCF modified his TBS-50D to work all bands with a Heathkit VFO. TWL is installing a new beam and building a 250-watt final. OIV has a new Heathkit VFO. HUI has earned the 2500 Traffickers Club certificate. QMF reports a 2-meter emergency net is being formed to connect with St. Louis. CPI has earned his 27th consecutive BPL certificate. W8UUVI has worked 25 states in the past five months. SUV's automobile accident kept him from being very active during December. WAP is giving A-3 a try with low power. BVL reports EBTN handled over 1200 messages during December. QXO reports KOMU recently carried a very fine ham program. HUI is building a new modulator for his final. BPL certificates were earned by BVL, CPI, FLN, GAR, GBJ, IJS, and KA. Traffic: (Dec.) W0CPI 2402, GAR 1030, BVL 567, CFL 448, IJS 420, KA 325, GBJ 306, FLN 216, ETW 119, ONIM 114, OUD 106, CKQ 95, TCF 86, HUI 77, BZK 73, SAK 63, WAP 53, VPQ 42, EBE 41, KIK 32, ECE 27, BUL 25, RTW 21, SUV 20, TSZ 17, RTO 16, TWL 12, SOZ 11, MFB 10, QMF 10, TGC 10, VFP 10, NHO 7, OIV 7, DFK 5, LMK 5, QXO 4, VTF 2. # BANTAMS *by*

2 element rotary beams for  
15 and 20 meters

element lengths only  
16½' tip-to-tip.

Designing and producing an effective shortened beam, such as the GONSET Bantam, requires skillful engineering and adequate measuring equipment...not intuition

There are certain "Musts". The wholly outstanding performance of the great many Bantams in use today is attributable to many things:

- (1) The very high "Q" coils used in parasitic and driven elements. Silver plated, copper tubing, self-supporting. . . secured only at the ends with highest grade ceramic insulators. Observe that these coils are of ample diameter, that no phenolic or ceramic form is used. For this reason the GONSET Bantam is unaffected by weather. COMPARE these inductors.
- (2) The Bow-tie elements which provide additional antenna surface area, semi-broadbanding. VSWR therefore remains at reasonable limits within a given phone or C.W. band. . . does not immediately soar as you move frequency. COMPARE these elements.
- (3) The effective link-coupled line-to-antenna system permitting use of 52 ohm coax line. . . providing excellent line match and low SWR. . . symmetry in the form of a balanced antenna pattern. The link is "stubbed" for reactance cancellation.
- (4) GONSET does not publish gain figures on the Bantam since these are meaningless unless the reference is clearly and cleanly tied down so that everyone is talking about the same thing. Hundreds of tests conducted under carefully controlled conditions do indicate that the losses in the Bantam have been reduced to a point where performance, including gain and F.B.R. approaches that of a full-length beam. . . IN ALL KINDS OF WEATHER!

These are sound reasons, theoretically correct, readily verified. They are the reasons why you should select a GONSET Bantam for 15 and/or 20 if lack of space. . . and a desire for DX. . . is your problem.

Model 666R pocket size VOM

**TRAVELING LIGHT**, too, on expense

Model 666R is only \$26.50 net

Enclosed selector switch of molded construction keeps dirt out. Retains contact alignment permanently. A Triplett design representing the culmination of a quarter-century of switch making experience. Unit construction—All resistors, shunts, rectifier and batteries housed in a molded base integral with the switch. Eliminates chance for shorts. Direct connections. No cabling.

Precision film or wire-wound resistors, mounted in their own separate compartment—assures greater accuracy. Four connectors at top of case, controls, knobs and instrument are all flush mounted with the panel.

3" 0-200 Microammeter, RED • DOT Lifetime guaranteed. Red and black dial markings on white. Easy to read scale.

Pre-calibrated rectifier unit. Batteries—self-contained, snap-in types, easily replaced.

# TRIPLETT

TRIPLETT ELECTRICAL  
INSTRUMENT CO.  
Bluffton, Ohio

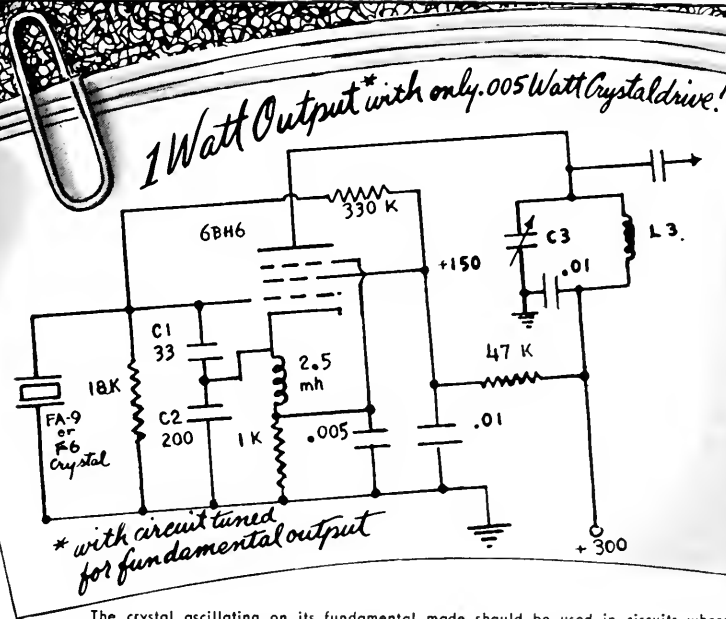

CN provide both morning and evening sessions for ORS to justify their appointments. UIZ furnished the only OES report, telling of 144-Mc. activity and schedules. EDA is active and looking for Alaskan contacts. EJI is the new EC for Bridgeport. EOB reports heavy traffic as he returns from Florida. WNI expects to resume activity when the kinks are out of the equipment. BGP came up with news from the Bridgeport Area: BSE received his General Class license, CRX is a new Novice, SARA has given 11 license exams and conducts code class Tue. nights, MFT showed slides of his recent visit to an SARA meeting, WAV is off to Florida. ADW is busy with c.d. activity but is back on 80 meters as well. GVJ is a new resident of Oakdale and wants OPS appointment. He is teaching at New London High School. IAN managed some time for the SS during a vacation from W.P.I. TD has a new antenna and is working on the big rig while his Official Bulletin schedule is maintained on 146 Mc. CUH has a new 813 final completed and is working on power supply and filter for expected TVI. BDI still is active on RTTY and resuming work on the new final. BFS got all December traffic from the West Haven Veterans' Hospital, where his wife is a volunteer helper. JW reports all his activity is in the v.h.f. region and mostly with c.d. WEE is having trouble getting out with his short antenna but is trying. Thanks to BVB and GIX for OO reports this month. RLN and EJI are new ECs, while RRE and JW renewed appointments. EDA is a new ORS, with renewals by BFS, WPR, ADW, and ZL. Traffic (Dec.) W1YBI 349, KYQ 259, AW 205, CUH 189, BDI 165, YYM 155, LIG 133, RGB 108, LV 100, EPW 99, BVB 76, HYF 58, QJM 51, RFJ 42, KV 28, NEK 26, BFS 19, UED 17, EDA 12. (Nov.) WICUH 160, TSZ 100, EDA 23.

MAINE—SCM, Bernard Seamon, WIAFT—SEC: BYK, PAM; WRZ, RM; OHT. The Pine Tree Net meets Mon., Wed., and Fri. on 3596 kc. at 1900 hours. BTY made the *Portland Press Herald* with a fine picture and a well-written story concerning his valued service to ham radio. ZMO has enlisted in the Air Force and is attending OCS at Wichita Falls, Tex. 6MSH, at Loring AFB, sends an FB letter reporting on activities at K1FCF. With two rigs, a 32V-2 and a BC-610E, and two receivers, a 75A-2 and a BC-342N, Dick and Alan, CEJ, have worked 30 countries. There are a number of other stations active at Loring, also. All the little PTLs were home for Christmas. RWB, formerly of Richmond, now is on 75 meters from his new QTH in Groton, Conn. Three new OBS appointees in Maine this month are JIS, TBZ, and WTG. Your SCM lost his sky hook because of a tired guy wire. VV is on the air from his trailer home in Bingham. The SCM ran into CV in Portland recently. Joe is planning to get back on 75 meters soon. The new EC for the Kennebunk Area is UOT. Traffic: K1FCF 284, W1WTG 282, LKP 127, YYW 84, UDD 80, UZR 31, VYE 28, WRG 25, EFR 18, BX 13, AFT 9, RJL 8, TWR 8, FD 4, KEZ 4, NXX 4.

EASTERN MASSACHUSETTS—SCM, Frank L. Baker, jr., WIALP—New appointments: WVD Norton, KEK Lynnfield as ECs; CLF as OBS and OO. Appointments endorsed: MD Hingham, RSE Whitman, MAN Marblehead, MME Hull, KWD Weymouth, RM member of Region 5 Comm. RFE Middleton, SH Dedham, FWS Milton, HRY Wellesley, PYT Ipswich, as ECs; AAR, NBS, BB, and LM as ORSs; AAR, GOU, MME, BB, and RP as OPSs; AAR, GOU, VMD, and BHD as OBSs; CUC as OES; RQZ as OO. 6JUT, ex-1DVC, writes from San Diego that he is on 20-75-meter "phone with 1 kw. s.s.b. BW, BGW, PXH, BGH, BB, MKW, and AYG took part in the November F.M.T. Radio Amateur Open House had Nelson Bragg for an entertainer and TWG gave a talk on TVI. ALP spoke at the Braintree Radio Club. New officers of the South Eastern Mass. ARA are KHV, pres.; ZPE, vice-pres.; LAZ, secy.-treas.; TZU and CNT, directors. AQI writes from 4LEV, Camp LeJeune, N. C. WCI reports that the c.d. group was called out for a bad break in a water main. LLY says that the Arlington 6-meter Net is on Wed. at 9 p.m. on 53.4 Mc. UKO received his BPL Medallion. WPW will have a Viking II. New ham section: BJX, BNZ, CNW, AJII. Novices in Waltham: CZG, CZS, DDN, DIL, DFL, and DIJ. New Tech. Class licensees: COL, CZM, and CWH. Heard on 2 meters: TYZ, ZGO, EAE, QA, ZXH, YBN, WHC, WTK, TON, ARO, ZOC, AMK, AQR, EJE, DGY, CRV, OOD, RTZ, NCO, IKK, SVV, YVB, DJA, LSR, ZHG, WIM, and BYB. QA is working at National Co. W1AAD is on 80-meter c.w. ARG has a TBS-50D. Heard on 10 meters: HSN, 2WAT/M/M, and RKU. JIQ has a Viking II. DFS is now our State Radio Officer and BL is Alternate State Radio Officer. We are very sorry to have to announce the death of PZ, of Lynnfield. ATU is on 40-80 meters with an ARC-5. New officers of the Bedford Radio Club are KJO, pres.; SPL, vice-pres.; YFP, secy.; NAD, treas. The Club has a net on 3600 kc. Thurs. at 1815 kc. with QJB as N.C. The 10-meter Net meets on Wed. on 29,120 kc. at 1900 with DTA and NDI as NCs. KJO gave a talk on transistors, TCG lectured on instruments as used in ham radio. Meeting date is the 3rd Thurs. The Falmouth Amateur Radio Assn. elected TJW, pres.; UXG, vice-pres.; DVS, secy.-treas. TJW has a new 80-meter

(Continued on page 98)

The crystal oscillating on its fundamental mode should be used in circuits where the drive level is limited to 10 milliwatts below 10,000 KC and to five milliwatts between 10,000 KC and 15,000 KC. A circuit meeting these requirements is shown above. The circuit will operate from 2,000 KC to 15,000 KC and limit the drive level to 5 milliwatts. By making capacitor C1 variable the crystal may be adjusted to exact frequency.

The correct load capacitance of the oscillator is extremely important in operation of the crystal, if the frequency of oscillation is to be within tolerance for which the crystal was manufactured.

To reproduce 32 mmf precisely, lead lengths and position must be taken into account. Capacitors C1 and C2, together with tube and wiring capacitance determine the frequency. Tuned circuit C3—L3 may be tuned to the fundamental or a harmonic.

## ONE-DAY PROCESSING

### Spot Frequencies 2000 KC to 54 MC

Orders for less than five crystals will be processed and shipped in **one day**. Orders received on Monday through Thursday will be shipped the day following receipt of the order. Orders received on Friday will be shipped the following Monday.

**.01 % TOLERANCE**—Crystals are all of the plated, hermetically sealed type and calibrated to .01% or better of the specified frequency when operated into a 32 mmf load capacitance.

### PRICES

FA-9\* (Pin Diameter .093)\*  
FA-5 (Pin Diameter .050)

Pin Spacing .486 (\*FA-9 fits same socket as FT-243)

RANGE	TOLERANCE	PRICE	
Fundamental Crystals		FA-9	FA-5
2000-9999 KC	.01%	\$2.80	\$2.70
10000-15000 KC	.01%	\$3.90	\$3.80
Overtone Crystals			
(for 3rd overtone operation)			
15 MC—29.99 MC	.01%	\$2.80	\$2.70
30 MC—54 MC	.01%	\$3.90	\$3.80

**HOW TO ORDER**—in order to give the fastest possible service, crystals are sold direct. However, crystals are also available by special order through your local jobber. Where cash accompanies the order, International will prepay the Airmail postage; otherwise shipment will be made C.O.D. Specify your exact frequency and the crystal will be calibrated to .01% or better of this frequency with the unit operating into a 32 mmf load capacitance.

# IT'S SPRING—TIME TO HIT THE ROAD!

by Bill Cummings, W1RMC

The first zephyr of spring gives us the tingles to get on wheels and shift into high gear. Naturally, we take our fellow hams along with us via a honey of a mobile rig just installed in our car. If you're planning an active mobile season, stop by and see our vehicle with a new outfit that has some features you'll find interesting. All you need is the car—we have everything else: dynamotors, filters, receivers, converters, noise clippers, squelches, mounts, loading coils, relays, cable and mikes. While we like the Gonset job featured below, we have lots of other rigs to suit your own ideas on mobile radio.

## GONSET SUPER-CEIVER \$119.95

GONSET SUPER-6	\$ 52.50
ELMAC AF-67 TRANSMITTER	177.00
ELMAC PMR-6A RECEIVER	134.50

Master Mobile and Radelco mounts and whips

## EASY TERMS

Dale fits the price to your budget—use the easy payment plan. And check Dale's trade-in deal before you change your rig.

# DALE ELECTRONIC DISTRIBUTORS

Serving the Entire Electronic Industry

150 JAMES ST., NEW HAVEN 13, CONN.

SPruce 7-5555

"Mini" beam. QLT has a new 60-watt VFO rig. YTA has a Heathkit VFO. The South Shore Club had a talk on transistors by A. Whitum. CLF handled traffic for many of the gang from 6ZZ during the holidays. CUC says he will be more active on v.h.f. this year. AAR has a B. & W. 5100. ZVC is C.D. Director for Norton and Asst. EC to WVD. HRY has a Viking II and Meissner 150B. RP has a Lyseo 600S VFO. VJMI, ex-2YAN, of Ipswich, has a Collins 32V-2. AR88, Elmac, Gonset, Tri-Band mobile. VIN, Carlisle EC, says they have 2 walkie-talkies, one mobile, 2 fixed, and 3 portable transmitters. The Wellesley Radio Club meets on the 1st Wed. of each month and has 14 stations on the 2-meter net and 3 mobile rigs. BB reports that they have their 20th crystal unit completed. ATP had a Gonset Communicator while at the hospital. LEM is on 2 meters. ZSS has his General Class ticket. The Area 1 Radio Comm. held a meeting in Cambridge with BL, CQ, QQL, ALP, OTK, IPA, and TQP present. ZYX is the new chairman; KTG is secy. HIL is on 10 and 75 meters with Elmac AF-67 mobile 'phone. New Novice calls in the New Bedford Area are DIY, DIR, and DIV. IPZ and RCJ had their EC certificates endorsed. CAM is a new ORS. Traffic: (Dec.) K1WAB 1329, W1EMG 656, 1BE 606, UKO 530, LYL 270, EPE 231, AVY 97, LM 69, TY 67, UE 56, CLF 28, QLT 19, NUP 14, WPW 10, YTA 9, BY 8, HIL 2, UTH 2. (Nov.) W1QLT 9.

**WESTERN MASSACHUSETTS**—SCM, Arthur Zavarella, W1MNG—SEC: CJK, RM: BVR, PAM: QWJ, WM C.W. Net meets on 3560 kc. Mon. through Sat. at 1900 EST; WM 'Phone Net on 3870 kc. Mon., Wed., and Fri. at 1900 EST with representation into C.W. Net for through traffic. New ECs are MSN, Russell, and WDK, Bernardston. SPF, Radio Officer and EC for Worcester, has a new QTH in Rochdale with able assistants AAP and JNA. RO gave a convincing demonstration of s.s.b. to QRM-riden A.M. operators on the Sunday Morning N.E. Net (3870-0900 EST). SRM was elected a director of HCRA, Inc., and not PGQ as previously reported. UKR continues her traffic trek with BPL again this month, complete with medallion. The team of WCV and WDK are keeping K1WAV in the BP "League." IINE is back on WMN after a vacation on 20-meter 'phone. Santa and Dame Foretune presented 20As to AVK and VBG, 75A-3 to ARA, SX-88 to BKG. BYH has a new Globe Scout and MARS call. NPL recently received a QSL from Hungary dated 1951. ICG and family were featured in *Sickles Digest*. IIT and KFY are working 40-meter c.w. QXV is back on 2 meters. Also active on 2 meters are TAY, ZWL, TDS, and OY. F.M.T. results show MUN leading RLG, QGO, and JYH with an average error of only .01 p.p.m. AMI, MND, and ZEL are helping to keep WMN on top from Worcester County. LJQ is doing likewise for Hampshire. MJD, MKD, and ZEO are toying with s.s.b. and will be welcome in the WM 'Phone Net. BH and MNG got "Slicer" kits. BVR checked into the WM 'Phone Net with traffic! RAD and SRM are collaborating with veteran news hawks PHU and RRX in *Zero-Beat* production for HCRA, Inc. Club-sponsored license examiners are BVR, NY, RRX, VNE, HRV, MOK, RLV, WLE, MNG, and SRM. Old-timers CND and KJB re-appeared on 10 meters. Traffic: W1UKR 652, WCG 240, K1WAV 162, W1WCC 144, BVR 107, SRM 78, MNG 62, WEF 36, TAY 34, RRM 31, WDK 31, DVW 19, WDW 17, BYH 14, BKG 9, UVI 6, JAH 4, ABD 3, BH 3, QWJ 2, ZEO 1, ZIO 1.

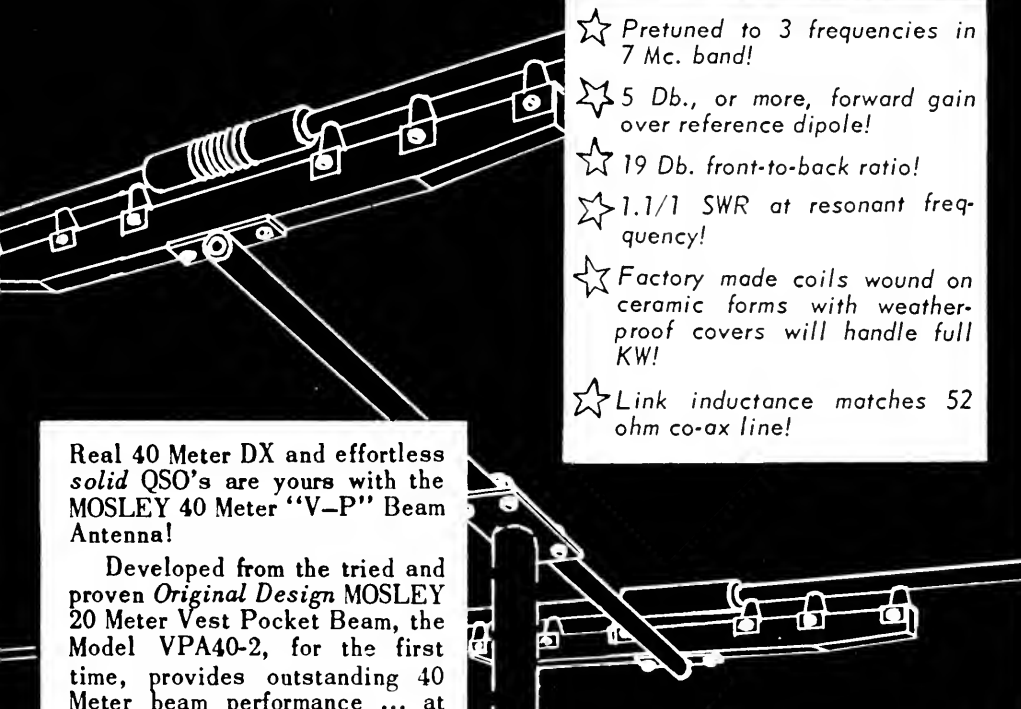

**NEW HAMPSHIRE**—SCM, Harold J. Preble, W1HS—SEC: BXU, RM: CRW, PAM: AXL, LVG was presented with twin-girl tax exemptions for Christmas. Concord Brasspounder officers for 1955 are SSK, pres.; RVQ, vice-pres.; HS, secy. We welcome the following New Hampshire Novices to radio: BYS, BQK, BQM, BQO, BXM, CAZ, COE, CCQ, CJE, CKE, CLY, CMV, and CFL. RCEN has openings for stations in Exeter and Hampton. ARR recently worked VP7NM on 80-meter c.w.; he also received a certificate as New Hampshire high scorer in the W/VF Contest. GMH now has sky wires for all bands 80 through 10 meters. COC reports good activity and coverage on the New Hampshire Slow-speed Net, including Coos County. TBS is attending Massachusetts Radio School. Look for him on YS. POK received a new mike from Santa. CDX is trying out the Heathkit transmitter and has 5 continents so far. VES is Acting NCS of the New Hampshire Slow-speed Net Tue. New ORS appointees are ARR and VZS. TNO/1 puts out an FB signal on 10-meter 'phone on the summit of Mt. Washington and is worked regularly by stations all over New England. He has a 2-meter rig also. Traffic: (Dec.) W1GMH 217, COC 118, CDX 57, WUU 57, IIS 18, VZS 12, ARR 9, FZ 8, CCE 6. (Nov.) W1CDX 302, POK 11, FZ 7.

**RHODE ISLAND**—SCM, Walter B. Hanson, jr., W1KKR—SEC: TQW, RM: BTV, PAM: VXC. All nets did a great job in handling the usual flood of Christmas traffic. BIS has a new Viking. BIL put up new beams with cold hands to get ready for the Sweepstakes. YKQ built and is using a cavity resonator for TVI elimination on 2 meters and reports sensational results. 4CVO/1 measured 26 parts per million in Frequency Measurement Tests. ZPH has built several 2-meter mobile transmitters and receivers as

FOR "40"

## 2 Element, 40 Meter MOSLEY VEST POCKET BEAM

- 
- ★ Pretuned to 3 frequencies in 7 Mc. band!
  - ★ 5 Db., or more, forward gain over reference dipole!
  - ★ 19 Db. front-to-back ratio!
  - ★ 1.1/1 SWR at resonant frequency!
  - ★ Factory made coils wound on ceramic forms with weather-proof covers will handle full KW!
  - ★ Link inductance matches 52 ohm co-ax line!

Real 40 Meter DX and effortless *solid* QSO's are yours with the MOSLEY 40 Meter "V-P" Beam Antenna!

Developed from the tried and proven *Original Design* MOSLEY 20 Meter Vest Pocket Beam, the Model VPA40-2, for the first time, provides outstanding 40 Meter beam performance ... at low cost and with an array of convenient size and weight!

### SPECIFICATIONS

- 14'10" Tubular Steel Boom with factory welded element support plates.
- 36'1 $\frac{3}{4}$ " Maximum Element Length. (61S-T6 alum. alloy.)
- 68 lbs. Assembled Weight.
- Element Sections and Element Supports pre-cut, pre-drilled for fast assembly.
- Sturdy 3" Ceramic Insulators and extra long Redwood Supports minimize element sag.

MODEL VPA40-2, MOSLEY 2 Element 40 Meter "V-P" Beam, less 52 ohm coax line, rotor and mast.

AMATEUR NET **\$74.95**

Other MOSLEY "V-P" Beam Antennas include: Model VPA20-2, 2 Element, 20 Meter, Amateur Net \$55.95; Model VPA20-3, 3 Element, 20 Meter, Amateur Net \$79.95.

# Boost your Station Performance 3 Ways!

## JOHNSON "MATCHBOX" ANTENNA COUPLER

### BANDSWITCHING—

for greater flexibility

### RECEIVER MATCHING—

for improved receiver performance

### EFFICIENT POWER TRANSFER—

from transmitter to antenna

Bandswitching on 80, 40, 20, 15 and 11-10 meters, the compact and self-contained "Matchbox" performs all transmission line matching and switching functions required in medium power amateur stations. Its revolutionary circuit design does away with the annoying use of "plug-in" coils and completely eliminates "load-tapping," necessary in other antenna couplers.

Almost an infinite variety of antennas in the 3.5 to 30 mc. range can be loaded with the "Matchbox". Balanced antennas from 25 to 1200 ohms resistance can be matched, while unbalanced, or single wire antennas within the range of 25 to 3000 ohms resistance can be successfully loaded. In addition, the "Matchbox" will tune out large amounts of reactance.

Nominal input impedance is 52 ohms—may be used with any transmitter having 250 watts maximum power input, and a PA plate voltage not exceeding 1000 volts. Tuning and loading is easily accomplished with two convenient front panel controls—all connectors located at the rear of the unit.

Attractively finished in maroon and grey—supplied as an assembled, wired, and pre-tested unit. Complete operating instructions included. Dimensions: 9 7/8" wide, 10 1/2" deep, 7" high. Weight approximately 6 pounds.

Catalog Number 250-23.... **\$49.85**  
Amateur Net

**E. F. JOHNSON COMPANY**

289 SECOND AVENUE SOUTHWEST • WASECA, MINNESOTA

shown in April 1954 *QST*, and all reports are terrific. ZPG is heard on all bands with his new B. & W. New ORSs are ZXA and YAO. The FRA has been issued the new call of OP and the gang is rebuilding transmitters for installation at the new headquarters, if and when. Contact VXC for OPS appointment and TQV for EC. Your SCM could use more reports on station activities or club functions. The silence from SKT is deafening. Election results of the FRA are SGA, pres.; KKR, vice-pres.; KKE, treas.; VZP, secy.; TQW, corr. secy. Traffic: WICDV 101, BTV 100, UTA 67, VXC 67, YKQ 29, ZXA 22.

**VERMONT**—SCM, Robert L. Scott, W1RNA—SEC: SIO. PAM: RFR. RM: OAK. Vermont nets operate on 3860 and 3520 kc. Those interested in AREC, please contact your local EC or Andy. SIO. BRG is working hard on getting the necessary information and machinery in motion to have license tags acted on. Word as to what you can do to help will be passed along as soon as things have reached that stage. KJG hopes to have new GG final on shortly. ETE has recovered from a bout with pneumonia. Traffic: (Dec.) W1OAK 196, RNA 173, AVP 90, BJP 53, IT 38, TEW 37, BNV 32, FPS 21, TAN 17, JLZ 10, KJG 3. (Nov.) W1KJG 7.

## NORTHWESTERN DIVISION

**ALASKA**—SCM, Dave A. Fulton, KL7AGU—The Anchorage Amateur Radio Club held a Christmas Party for all the hams in the Anchorage Area. There was a very good turnout with about eighty-two attending. We have received a few inquiries in regard to reactivating the Sourdough Net on 75 meters. Anyone interested in seeing this net run as a traffic outlet and in a business-like manner, please drop us a line and we will see what can be done. We have heard a rumor from a pretty reliable source that there will be a KL7 certificate out soon. This certificate will be awarded to anyone working ten KL7s in the various parts of KL7-Land. It will be sponsored by the Anchorage Amateur Radio Club and as soon as we can we will have full details. BK is in Fairbanks getting KTVF on the air. TVI here we come! It's not too bad, fellows, so far no TVI problems here in Anchorage.

**IDAHO**—SCM, Alan K. Ross, W7IWU—Lewiston: IDZ reports on the local gang. New officers of the Lewiston-Clarkston Amateur Radio Club are GMC, pres.; UJA, vice-pres.; TLW, secy.-treas.; and NOG, reporting secy. VIO has a Heathkit VFO, while IDZ assembled a Viking Adventurer. OWG is driving a new Ford. WNTYBV is running 16 watts to a 40-meter vertical. Caldwell: EYR has a new Viking II and antennas for 75, 40, and 20 meters. Kellogg: RQG has to let up on ham radio because of travel and extra work. RSQ is giving s.s.b. a lot of thought. Bonners Ferry: VMF, the 13-year-old son of QC, worked Norway for 32 countries. Boise: NVO is trying to tame the ARC-4 front end. AXV and BMF still are on s.s.b. OZJ and YAD are on 75 meters a lot. Two meters is very active. MWP, on Deer Point, 7000 feet up, can work Twin Falls on 2 meters. This band is to be encouraged for local c.d. work, and also gives a good chance for DX through MWP. Traffic: WTYG 39, NVO 4, EYR 2.

**MONTANA**—SCM, Leslie E. Crouter, W7CT—Long-skip conditions have prevented both the Montana Phone Net and the Montana State Net (c.w.) from having any contacts after the late afternoon during the past month. FUB has substituted as NCS a few times for the South Dakota Net. BSU was located at the new QTH in time for the November SS Contest. SFK is operating from a new ham shack (studio A). Ray is using s.s.b. with 20A exciter. EWR reports 14 charter members in the new Hi-Line Radio Club at Havre. NZJ and KUH have started a series of local on-the-air chess games. MM has been working hard to get Montana aligned for ham call letters on auto license plates. NPV reports the following new hams in Harlowton: YFH, YHB, and YHC. WDE is a new ham in Winifred. WSE, ex-0PPJ, from Valley City, No. Dak., now lives in Lewiston. JRG is doing considerable experimenting on 132 Mc. Ken has a new balanced modulator for 3.9 and 50.4 Mc. using 832A. Your SCM has been promoted and will be located in the capital city of Helena by the time this goes to press. Traffic: (Dec.) W4SFK 75, MQI 15, CT 13, FUB 11. (Nov.) W7MM 105, EWR 3, NZJ 3.

**OREGON**—SCM, John M. Carroll, W7BUS—Officers of the Rogue Valley Radio Club are ISP, pres.; VCQ, vice-pres.; EZR, secy.; LNG, treas.; TZP, technical advisor. SBT is active on 2 and 6 meters. QMK is Asst. EC in the Medford Area. ISP is net control on the 29.5-Mc. Net. KTL is putting up an all-band vertical. APF renewed his membership in ARRL. The *OARS News Letter* is a fine letter and should be subscribed to by all the Portland bunch. QBT is building a new QTH. AIHZ has moved to Denver. SY has an office in the State Office Building. MNS is working on RTTY gear. The Tillamook gang has a club room in the basement of the City Hall. RQN beat THX out on the DX recently. QKN is on 2 meters. VLJ and YFK have registered with AREC. KTF has purchased an old school house up in the mountains for a summer QTH and is taking applications for his PTA. BUS has ordered an s.s.b. rig. Traffic: (Dec.) W7APF 1679, JHA 668, QKU 418, VIL 128.

**WASHINGTON—SCM.** Victor S. Gish, W7FIX—ATTENTION ALL WASHINGTON SECTION CLUBS: This section is in need of a Section Emergency Coordinator and more active ECs. Each club not now having an active EC, please nominate one and send his name and QTH to your SCM so that appointments can be made. At the Dec. 9th meeting of the North Seattle Radio Club FRU was presented with the Chif Cavanaugh Award for the award 1954—a de luxe Vibroplex presented annually to the WSNet operator who contributes most to c.w. operating in the section. FRU brought over some clippings from his home town paper with reprints from the year 1900, showing his name as a member of the high school class who built and demonstrated a "wireless set." This should get George membership in the "Old Old Old Timers Club." The NSARC is installing a 2-meter beam on the club station for e.d. use. KZ is trying 40-meter DX for a change. AIB insists that conditions are the worst he has ever seen. ØSQQ/7 reports from Everett. AMC got the XYL a TV set for Christmas! OE reports from Dalesport, Wash.; next stop is Bellingham. AVM (Aberdeen) is working BTV (Olympia) consistently with converted 522 on 2 meters. PRZ was home on Christmas vacation from Cornell U. to visit the OM, ZU. K6BDF/7 says conditions are so bad in Washington that he can't hear QRM. BMK reports better results by replacing the Windom antenna with a half-wave doublet. ULK worked 66 YLs in 19 states in the YLRL Party. TIQ is working 20-meter DX. AVM is RACES Radio Officer for Aberdeen. OUK is with c.d. in Whatcom County. OEB still is working shifts—tough on traffic. PHO, DET, and OZG are going for kw. rigs. 6PZG/7, now in Seattle, is working 80-meter traffic. UQY reports new Richland hams are YFO (ex-6PNK) and NIZ. TGS now operates club station KLAIZ on Adak and is going to try to hook up with RN7 on 3575 kc. with 450 watts. LVB reports his OM (6HTN) is sending him components for a half-gallon c.w. rig. TGO has a 66-ft. vertical for 80 meters. GAT burned out his power transformer. Traffic: (Dec.) W7BA 2303, PGY 1945, K7FAE 729, W7VAZ 508, FIX 178, KZ 162, EHH 127, WØSQ/7 98, W7RXH 81, UMC 75, RXH 62, APS 59, AIB 41, JY 37, UZB 24, AMC 23, VCF 21, WEV 18, FWD 16, OE 14, TGO 10, AVM 8, ZU 8, EVW 6, K6BDF/7 4, W7BMK 4, GAT 4, ULK 3, TIQ 2. (Nov.) W7FRU 879, KT 52, AVM 1.

## PACIFIC DIVISION

**NEVADA—SCM.** Ray T. Warner, W7JU—ECs: PEW, PRM, TVF, TJY, and ZT. OPs: JUO and UPS. ORs: MVP, PEW, and VIU. OBS: BVZ. Nevada State Frequencies: 'Phone—3880 and 7268 kc.; e.w.—3660 and 7110 kc. PRM is now EC for Boulder City. TVF is EC for Las Vegas. How about backing these fellows with an increase in AREC activities? More and more of the gang are showing on the above chosen Nevada frequencies. The demand for Nevada QSLs appears to be heavier than ever! TVF now has 50 Nevada QSLs! The Southern Nevada Amateur Radio Club (SNARC) now has 42 paid-up members. VIU thinks a lot of his Viking II since working ZK1BG on 80-meter c.w. JUO fabricated a beautiful copy of the Gonset Commander. Traffic: W7VDC 43, VIU 35, JU 16, IJ 9, SNF 9.

**SANTA CLARA VALLEY—SCM.** R. Paul Tibbs, W6WGO—MKM, San Mateo, sends in the following report. The San Mateo Radio Club elected the following new officers: INN, pres.; K6DM, secy.; ABE, treas.; and MKM, board member. TPZ is installing a 144-Mc. antenna trying for DX on v.h.f. K6DM is active on 7 Mc. using a vertical for transmitting. There have been no new cases of TVI reported to the TVI committee in San Mateo from the FCC office for the past three months. INN has a kw. on the air now. FON again is a grandpa on the birth of a girl to K6HIGJ, the XYL of VZT. Oh, yes, the uncle is AVJ. WLL, very active as an OO, was elected secretary of the SARO at its December meeting. K6BBD has been appointed OBS. Dick would like skeds with stations in Maine, Delaware, Vermont, and North Carolina. NOG decided that two could work 144 Mc. as cheaply as one and acquired an XYL in December. YHM is using an HQ-140X now. RN6 and PAN still can use operators, so any of you who have just lost your Novice call and now have a General Class license, get in touch with HC in San Jose. Harry will start you on the road to some pleasant hours operating with some very swell amateurs, some new and some old. Anyone who happens to be in the vicinity of San Mateo the 2nd Wed. of each month, drop into the Fiesta Building, attend the club meeting, and meet all the San Mateo gang. Traffic: W4YIP/6 1615, W6YHM 652, HC 472, UTV 200, AIT 85, K6BAM 57, BBD 11, W6WLI 10.

**EAST BAY—SCM.** Guy Black, W6RLB—Asst. SCMs: Oliver Nelson, 6MXQ, for v.h.f.; and Harry Cameron, 6RVC, for TVI. RMs: IPW and JOH. PAMs: LL. ECs: CAN, CX, FLT, QDE, TCU, ZZF, and K6ERR. Once again the many radio clubs in the East Bay section report having highly successful Christmas Parties. The Mt.

# JOIN THE LONG-LIFE FAMILY

When you rebuild, see how many of these Los Gatos favorites will fit your new circuitry. Or, use them when re-tubing.

You may be surprised, and you'll certainly be pleased with the additional nine-plus lives you'll get from these carefully-made electron tubes.

Ask for them at your jobber. If he doesn't have them, he can get them for you — overnight in most locations.

633 WALNUT STREET • CINCINNATI 2, OHIO

Diablo Club's Party was outstanding and unusual in that it was an affair for the kids, but there was nothing wrong with the other parties either. The Skyriders Net came to the rescue of three persons trapped in a wrecked car in an isolated area of San Mateo County on Jan. 5th. DEG's new QTH is Memphis, Tenn. When the weather turns cold think of JIG, whose QTH is 5064th Cold Weather Material Testing Squadron, APO 731, Seattle. The Napa County CD has some Gonset Communicators and is obtaining crystals on 147.11 Mc. CAN's appointment as Emergency Coordinator for the Napa AREC has been renewed. Wayne reports a Napa AREC Net at 9 A.M. Sun. on 3885 kc. 9QOM now is organizing K6FDJ at Parks AFB and is getting additional equipment. BAO and BAT are now 432-Mc. mobile. VSV wants to try pulse modulation on 1215 Mc. — as soon as it's legal. EE has retired as head of Oakland Civil Defense. A real amateur himself, Shell believed strongly that civil defense should rely heavily on amateur participation and he put his belief into words. His civil defense communication system was a pace-setter for the Bay Area. Hope you enjoy relaxing, Shell. The Official Observers of the East Bay section are PSL, JZ, HBF, CTL, RLB, EY, YDP, WOC, CBE, NGC, ITH, BEZ, and LTI. HBF reports he has his BC-459 going on 40-meter c.w. JHV now is high power on the low frequencies. VS reports being QRL lately. Your SCM was treated royally by the ARRL Headquarters gang when he dropped in on the West Hartford office during the Christmas season. It would be a thrilling experience for any ham. Traffic: (Dec.) K6FDG 1294, W6QPY 807, K6GK 449, W6LPW 118, EFD 80, LL 44, ASJ 36, HBF 25, EJA 24, VSV 4. (Nov.) K6GK 119, W6EFD 62, JOH 60, ASJ 36, ITH 31, HBF 19, K6CCQ 1.

**SAN FRANCISCO — SCM, Walter A. Buckley, W6GCG** — The San Francisco Radio Club held its annual Christmas Party the 3rd Fri. in December. A good time was had by all. The HAMS Club has changed its regular meeting night to the 1st Fri. of each month so that the boys also can attend the Oakland Club meetings which are held the 2nd Fri. The San Francisco Naval Shipyard had its Christmas Dinner at Grotto 9, Fisherman's Wharf, with a good show of hams. The Tamalpais Radio Club now holds its monthly meetings at Novato. The Marin County Radio Club had a large group show up for the season's dinner held at El Verano. The Young Ladies Radio Club of SF prepared and served the food for the SF Radio Club Party. The 29ers lost another of its group, K6ALF, to Uncle Sam's Navy. The Humboldt Radio Club members were all on the alert during the big shake. K6FKI was in town mobile when it happened and contacted GL, in Crescent City, who was first to give the news to the Crescent City broadcasting station. Both Eureka stations were off because of power shortage. K6DVV, W6CNG, and BME all gave reports to VRG, in Oakland, to give to the *Oakland Tribune*. CNG and ULF held a circuit for a time for emergency railroad traffic but none was required. However, many messages were handled because of overcrowded telephone lines. The Club held its Christmas Party in lieu of its regular meeting and reports a fine time was had by the group. AEY let the stove in his ham shack get overheated so now he has a hole through the roof. OPL received lots of help erecting his V-37 antenna on Dec. 5th. ATO, BON, GGV, GQA, GTY, HST, OCZ, OST, TLN, TMF, and K6CWS all helped and report the best antenna-raising feed ever held. ZYL and PW did within a few days of each other during the holiday season. CBE reports that he is going low power and is building a 40-watt rig. YC has been handling traffic from Japan, usually on Sun. SWP has been having trouble, high noise level is wrecking his reception. Congratulations to QMO on the BPL total for December. ACN reports that the Bill for the ham license plates renewal was introduced on the legislature floor the first day of the new session at Sacramento. GHI is new representative for the HAMS at the Central California Council meetings. PHT has a new TV and radio store in San Francisco. Lots of luck and success in your new venture — "CYN's TV & Radio Shop." A local amateur made the headlines in the San Francisco newspapers and radio broadcasts on Dec. 5th. He was driving on a very lonely road down the country shortly after a car went into the ditch and trapped three people. By means of his mobile rig he was able to bring help to them very quickly. WD, Arthur Hart, certainly let the people know of the good deeds amateurs can do. Local papers gave Arthur a real nice write-up. Traffic: W6QMO 710, PHT 668, SWP 226, GGC 82, YC 14, GQA 3.

**SACRAMENTO VALLEY — SCM, Harold L. Lucero, W6JDN** — Fellows, let's build this section to one of the best during 1955. It can be done with the help of all of you. The Annual Christmas Party of the Sacramento Amateur Radio Club proved to be a big success. ILZ acted as master of ceremonies. The following served on various committees: DIE, GIE, HGW, IOY, JEQ, QKJ, RNR, VKT, ASI, LLR, VBU, and BTY. Six Heathkits were awarded as prizes and the main prize, a Globe Scout, was won by AK. ASI is constructing a Linear. OPY is active on traffic nets. MIV is active on 144 Mc. LLR has a BC-610 and is on 75 and 40 meters. ILZ completed the kw. final. JEQ, c.d. coordinator, announces the Sacramento Communications Plan is on its way to FCDA and FCC. K6CNA is active

with a Globe Scout on 75 and 40 meters. CMA has duels as excitor-frequency standard. K6FR is on mobile. RNR is having trouble in the 4-250A final. KKI has a new portable unit. QDT is going back to s.s.b. KQJ is experimenting with indoor antennas. MARS officers at McClellan AFB are HIR, pres.; ESZ, vice-pres.; LIR, secy. AK has a new Twin Yagi on 144 Mc. QYQ is active on 75-meter mobile. AD is active on 75 meters. FNS is sporting a new car and mobile set-up. OPY is on 'phone at times with a Viking. TYC is doing nicely with the PAM job. SBH, of Red Bluff, really puts out the Official Bulletins. BH reports that SM60B is operator aboard the *Silver Gate*, running between Europe and W-Land to VEO-Land. 5QDF/6 made BPL Traffic: W5QDF 6 1464, W6OPY 82, MWR 56, JDN 10, TYC 3.

**SAN JOAQUIN VALLEY** — SCM, Edward L. Bewley, W6GIW — SEC: EBL, RM: K6BGM, PAMs: ZRJ and WJF. As in the past, the holiday season brought a heavy load to the traffic nets, and this section carried its share of the load. BPL awards were issued to K6FAE, W6ZJR and W6FEA. BRAT awards went to K6EVM, K6BGM and W6ZJR. EXH was awarded a Meritorious Medal Award by the Ground Observer Corps in recognition of his work with the 2-meter group in San Joaquin County. The Trowel Club held its Third Annual Winter Hamfest in Fresno, and it was a big success. Newly-elected officers of the Stockton Club are HQY, pres.; K6CZO, vice-pres.; W6PJF, secy.; DBH, treas.; RKN, sgt. at arms. KN6HWT, the blind boy sponsored by the Stockton Club, is now on 2 meters. DVI qualified as Class I Observer in the last Frequency Measuring Test. RLG has been selected as EC for San Joaquin County. ADB is on s.s.b. with a 10B exciter driving a pair of 837s in grounded grid amplifier at 300 watts. Traffic: (Dec.) K6FAE 2206, W6ZJR 514, GJO 265, FEA 207, ADB 136, K6EVM 88, BGM 60, W6SJJ 24, EBL 23, TXM 4, WJF 4. (Nov.) K6FAE 638.

## ROANOKE DIVISION

**NORTH CAROLINA** — Charles H. Brydges, W4WXZ — CVX is still working DX on 20 meters. The best so far for Tom is VK4. ONM reports that 2-meter activity is lively in Greensboro. The gang in Greensboro now has an emergency generator. SGD has been busy with nets. Katherine recently completed YL-WAS and is waiting for her certificate. ZKE has a B&W transmitter. A new Novice in Wadesboro is KN4BED, using a Globe Scout and HQ-140X. Others in Wadesboro are 5JYB/5 and W4CSH, who are with Air National Guard. DLX is about to get his basement finished. ZMG was NCS of the Tarheel Net for the month of January. FUS did a swell job during the hot month of December. BUD has a new Viking and is working out FB. Some of you should get on 2 meters. There is a very good net in Winston; also a good net over the State. SOD is signing up AREC members in Lumberton and also in the adjoining counties of Bladen and Hoke. You fellows who are not signed up, get in touch with SOD. Ex-451Y now is VP7NW and is looking for Winston-Salem stations. YBQ reports RACES is being organized in the Statesville Area. How about more reports from you ECs? Many thanks to all for sending those great monthly reports. They sure do make the job much easier. Traffic: W4WXZ 612, RRR 90, BTZ 52, BDU 34, CVX 8, YPY 6, BUA 4, SGD 4, YBQ 2.

**SOUTH CAROLINA** — SCM, T. Hunter Wood, W4ANK — PED is back on the air on 80-meter c.w. NJG has installed an Elmac mobile transmitter. LXX is ORS and reports that FGX is working DX on 20 meters. ERG is EC for Bamberg. AKC has an A-1 Operator certificate and reports the following reporting into the C.W. Net: AKC, ANK, CHD, HMG, LLI, KTL, KYN, MVX, RPV, TDJ, TTH, UFP, UWA, WJH, WP, WKZ, YAA, ZIZ, ZJY, ZKU, and K4AQQ. The S.C. C.W. Net meets at 7 P.M. Mon. through Fri. on 3525 kc. A joint meeting was held between the Columbia and Charleston Clubs with NJG, president of the Greenville Club, TTG, EC for Orangeburg, and groups from other parts of the State in Columbia on Jan. 6th. Organization of clubs in South Carolina and the value of ARRL membership was discussed. The feature of the meeting was presentation of the Corn Cob trophy to the Columbia Club by the Charleston group as a consolation prize for making low score in the '54 Field Day. The Charleston group had received the Corn Cob as a result of losing the 1954 transmitter hunt. It was mounted on an engraved walnut placard with an ancient key and Marconi antenna. ZRH is transmitting code practice and Official Bulletins on 3700 kc. at 7 P.M. nightly using tape-keyed 800-watt transmitter. Traffic: W4AKC 334, K4AQQ 144, W4ZIZ 126, ANK 79, RPV 18, MVX 7, EDQ 4, SOY 4, TTG 4, HMG 1.

**VIRGINIA** — SCM, John Carl Morgan, W4KX — Santa seems to have done well by the gang. IA reports he and jr. operator TFX now have new Viking II and 75A-3 to play with. CGE has new BW-5100 and 576. Others found various hunks of swell gear in their socks. YE and No. 1 jr. operator YZC are building all-band, half-bucketful rig with separate finals for each band. YE's 11-year-old passed his Novice Class exam and is awaiting his call. KFC says he worked countries No. 98 and 99 on 80 meters. Vic also reports visits from W4KVM/V06 and KH6YL. 3WDP, who

has kept K4MC hot, has overseas orders. 3LEZ reports he operated from Front Royal during the SS. ZFV is too busy at school for hamming, and his "Hazelized" antenna at home still is just junk wire. SVG made BPL on originsations as a result of promoting traffic at the Service Men's Club. 3QQE continues busier than a bee in a tarbucket at PFC as his 2247 traffic total for December will testify. LW reports activity on VON is booming, with 16 different stations QNI in December. If conditions continue on 80 as they have been, we'll all have to move up there to 160 meters, Dick, or resort to smoke signals. BLR says OM BVB built 'em a new 813 rig. OMV reports duty at WSVA-TV's mountaintop transmitter cuts into hamming. WBC reports MARS Net No. 3 staked out mobiles at shopping centers in the Arlington Area to promote traffic for overseas servicemen and 75 messages were handled via K4AF, EBH, now in a new wig-wam, still has no antenna, but has been so busy running ground radials he has more copper in the ground than Anaconda. The SVARC should be in its new club building by the time this appears. Traffic: W4PFC 2247, SVG 216, OMV 121, YKB 100, KX 82, YZC 70, DWP 46, DBE 43, CFV 35, RJW 32, KFC 29, BLR 25, BLR 18, TYC 16, LW 14, CGE 10, JAU 10, TFX 10, WBC 10, IA 9.

**WEST VIRGINIA** — SCM, Albert H. Hix, W8PQQ — WNSSNG is doing very well toward his WAS with 15 watts on 80 meters. BOK was active in the last 'phone CD Party. PZT and JWX visited HZA, PQQ, and the Princeton group in December. I am sorry to report the passing away of ex-MZD, of Clarksburg. HZA is putting up a real long wire for 80 meters. He has been working good European DX on this band. QHG is coming right along on his new 500-watt rig. ING handled lots of traffic from the Morgantown Hobby Show. ETF is on 6 meters along with HI. VCT is back from Texas and is active now. FOJ will have his kw. s.s.b. rig going soon. ZJS skeds ex-DMF, who is now in Florida. NLT is getting ready to put up a 15- and 20-meter three-element beam system. LS is doing a good job mobile. CLX has a Ranger and is active now. FOJ will have his kw. s.s.b. rig going soon. ZJS skeds ex-DMF, who is now in Florida. NLT is getting ready to put up a 15- and 20-meter three-element beam system. LS is doing a good job mobile. CLX has a Ranger and is active now. The Tri City Club has been meeting lately at the South Charleston Naval Reserve Armory. Guests are certainly welcome. Your SCM would appreciate receiving more information for this section. GEP is very active on the various nets and does a bang-up job. Traffic: (Dec.) WSGEP 137, JWX 126, HZA 69, NYH 44, ETF 36, KDQ 21, DFC 18, IXG 18, PQQ 6. (Nov.) W8DFC 25.

### ROCKY MOUNTAIN DIVISION

**COLORADO** — SCM, Karl Brueggeman, W0CDX — SEC: MMT. RMs: KQD and KHQ. PAM: IUF. The statewide drill was a success, with stations from all over the State reporting to net control with members of the legislature in attendance. AEE handled the net control, assisted by WIR and MMT. Our bill has been introduced and has been turned over to the transportation committee for action. We must now contact the members of that group in order to keep them reminded of our needs. Also all must write their legislators so that they won't forget us when it comes time to vote on the bill. If you need more copies of the bill, contact IC and he will send them to you. IUF made BPL with 102 originsations. EKQ reports that the CSSN is doing find and a new ham in Littleton is W9WNJ. The Hi-Noon Net handled 437 pieces of traffic in 21 sessions. HOP has a new rig running 500 watts on c.w. Congratulations to the Trout Route Mike and Key Club on its affiliation with ARRL. New officers are MMP, pres.; Muriel Schwarz, vice-pres.; Ray Wilhelm, secy. We all want to give the MARS stations in the State a vote of thanks for the fine way that they are working with our amateur groups. They have brought our traffic totals up to a very respectable figure and can always be counted upon to help us whenever we need it. Traffic: K6FDX 4821, WBB 2529, W0KQD 1334, YGB 782, IUF 200, PGN 93, YQ 83, BWJ 52, LNH 48, EKQ 46, TVI 41, IC 35, WGB 31, IA 23, SWK 19, HOP 9, TVB 6.

**UTAH** — SCM, Floyd L. Hinshaw, W7UTM — TVL is busy looking for a new QTH, hoping for room for a new ham shack. 9VZQ is a regular visitor to W7-Land, flying United planes from Chicago to Salt Lake. QDM is now being pushed into a rebuilding program since receiving a new 6-ft. rack for Christmas. BLE still is commuting from Salt Lake to Denver, but says slick roads and mobile operation do not fit together too well. SP has nearly forsaken low-frequency contacts for 2 meters — not nearly as much QRM on 2 meters! MWR has a potent signal with new 500-ft. skywire. Traffic: W7PIM 111, UTM 35.

**WYOMING** — SCM, Wallace J. Ritter, W7PKX — NVX, president of the Casper Club, reports the club house is nearly completed, with console operating position and Viking Ranger two-thirds installed. JSS visited IWF and LLP while in Sheridan. NVX visited PKX to arrange for relay of bowling scores. QNR recently hooked his 65th country. PJX has plans for a 813 final. LLL, recently-appointed OBS, starts schedules following the Pony Express Net. PAV's stolen 10-meter mobile was found in unusable condition. The Sheridan Club will go 2-meter mobile in the near future with rigs designed and engineered by LVU. QPP and LLP are "prospecting" on 2 meters. PKX holds

(Continued on page 110)

*Your Rig is only as effective as the Antenna you tie it to!*

$$\begin{aligned} \frac{\partial (e_3 E_v)}{\partial v} - \frac{\partial (e_2 E_v)}{\partial \omega} &= -j\omega e_3 e_2 H_v \\ \frac{\partial (e_3 H_v)}{\partial v} - \frac{\partial (e_2 H_v)}{\partial \omega} &= j\omega e_3 e_2 E_v \\ \frac{\partial (e_2 E_v)}{\partial v} - \frac{\partial (e_1 E_v)}{\partial \omega} &= -j\omega e_2 e_1 H_v \\ \frac{\partial (e_2 H_v)}{\partial v} - \frac{\partial (e_1 H_v)}{\partial \omega} &= j\omega e_2 e_1 E_v \end{aligned}$$

**AMATEUR**

Out of ANTENNA ENGINEERING LABORATORIES, where Radiation experts and Scientists have developed the E.D.\* principle for Military, Commercial and Marine use, comes a

# RADICALLY NEW ALL-BAND "E. D." ROBOT SKYHOOK!

● This New, All-band Antenna, precision-manufactured by ANTENNA ENGINEERING COMPANY, does exactly what has long been considered a virtual IMPOSSIBILITY.\*

*Do you want*

AUTOMATIC all-band coverage including Novice, C.D. & MARS

AUTOMATIC IMPEDANCE-MATCHING on EVERY BAND

AUTOMATIC Radiation-pattern Control

AUTOMATIC Colinear Array on 15 and 10 meters (V-37)

ALL with maximum operational EFFICIENCY and convenience

*Then YOU want—and can NOW HAVE—your CHOICE of a VARIETY OF MODELS of "E.D." All-Banders which have been*

DESIGNED for AMATEUR SERVICE  
by Antenna Scientists

DEVELOPED for HAMS at the  
A.E.C. ANTENNA LABORATORY

PRECISION-MANUFACTURED for Quality  
Control at the A.E.C. FACTORY.

# we can deliver from stock

## the new PANADAPTOR MODEL PR-1

## the eyes of your modern receiver

The new smart-looking PR-1 has sufficient compensation available to provide wide-view Panoramic reception with modern receivers featuring high selectivity. Operates with receivers having an IF of 450 kc-470 kc or 500 kc.

The PR-1 offers visual monitoring over a band of frequencies up to 200 kc, let's you "see" . . . everything from the other fellow's frequencies in three-way or round robin QSO's to replies to your CQ's. You see it all on a 3-inch CR Tube which also simplifies frequency setting and station monitoring, facilitates network operations, assists in making adjustments of transmitters and antenna, enables identification and interpretation of transmitter signal characteristics (your own and others) selects QRM-free spots for sending and listening.

Features • Visual displays up to 200 kc wide • 3-inch Cathode Ray Tube • Phone output for use of PR-1 as a second unisignal aural receiver • Cathode Ray Tube connection for use as external "scope."

ONLY \$199.75 Net

When ordering specify model  
of your receiver and IF.

Mount Vernon 4-3970

code practice sessions on 3820 kc. 1900 MST Tue. and Fri. Volunteers for ORS, OO, and RM appointments are requested. PAM KFV is operating on 160 meters. All interested in EC appointment, please contact PAV, recently appointed SEC. Traffic: W7PKX 412, HDS 88, KUB 22, LLP 16, PAV 15, UZR 15, JSS 12, IWF 9, KFV 8, LHW 6, MWS 4, PAW 4.

### SOUTHEASTERN DIVISION

**ALABAMA**—SCM, Joe A. Shannon, W4M1—SEC: TKL RM: KIX. PAM: RNX. Welcome to the Valley Amateur Radio Club in Lanett! Officers of the new club are PHY, pres.; KPJ, vice-pres.; CHO, secy.; FL, treas.; VUO, act. mgr. The Club presently is working on a training program and organization of an emergency net for the area. The Birmingham Club has a new slate of officers headed by WJX, the Club's first XYL president, YYJ (also an XYL), 1st vice-pres.; ZSQ, 2nd vice-pres.; KNW, secy.-treas.; YEG, rec. secy. CRY has moved to Cullman and is back on the air after a short stretch of strictly mobile operation. YAI now meets a total of six nets. We welcome the following newcomers to the Florence Area: KN4s ARD, AUP, AVA, K4AEN, W4EVJ, and KN4BEQ, jr. operator of TXO and now working on General Class. TKL now is mobile on 2 meters—145.35 Mc.—and is waiting for others to join in. ZSQ has s.s.b. going and has revamped the operating position. OAO is on with Viking I in Anniston. Traffic: (Dec.) K4FDY 1897, W4UHA 950, WOG 780, COU 646, KIX 189, YNG 139, YAI 101, DXB 73, K4ACO 62, W4YRO 59, TXO 39, TKL 22, ZSQ 19, BRE 14, MI 14, VYI 11, ZSH 11, OAO 10, BFM 9, RNX 8, W5ONL/4 6, W4DDP 4, HYI 4, PWS 4, (Nov.) W4UHA 363 (correction), W5ONL/4 18, W4CAH 15, W4HW 12.

**EASTERN FLORIDA**—SCM, John W. Hollister, jr., W4FWZ—Sorry, gang, but a double-barrelled shot of the flu got me. The December report will be confined mostly to traffic reports. AQJ and OLA have new 20-meter beams. Club notes—Jacksonville: JARS officers are UHE, WEO, TRN, AGT, and NKC. Ft. Lauderdale: BARC officers are JZB, LRMI, PM, EUV, and CQP. Traffic: W4PU 916, DVR 699, BMY 606, WEO 196, TJU 140, WS 135, LAP 118, K4ANJ 101, W4AWY 94, HCQ 79, LMT 76, DSC 58, IM 47, ZIR 44, RWMI 43, TRN 41, FSN 39, TKE 39, IYT 33, YOX 32, CQP 27, ELS 24, DES 8, FJE 5, FWZ 5, PBS 5, WEM 3, DRT 2, YNM 2, YW 2.

**WESTERN FLORIDA**—SCM, Edward J. Collins, W4NS/W4RE—SEC: PLE. ECs: HIZ and MFY. JPD has the new B&W. 5100 going. AIA keeps Marianna represented on 75 meters. BGO is on s.s.b. MS has the 250THs going s.s.b. BFD is interested in ham-TV. BGG is working DX on 21 Mc. KN4AEP has a new receiver. GMS had BCI from over a hundred a.c.-d.c. sets in the dormitory. ZFL is a DX hunter. The Pensy Amateur Club had a wonderful Christmas Party. DAO/DEF has a new NC-183. QK has a pair of 813s on 75 meters. HGO is using cathode modulation on 75 meters. UUF still is working 144 Mc. UYS is after 144 Mc. PAA has a new 32V-3. FHQ and VR keep true to 7-Mc. c.w. RZV is kingpin of the Dagwood Net. KN4AGM raises too many stations on her CQs. NOX/NYZ keep traffic rolling out Bohemia way. SOQ is thinking s.s.b. 9CPI/4 wants s.s.b. for his 5100. GMS wants kw. final for the Ranger. Traffic: KN4AGM 5, W4AXP 3.

**GEORGIA**—SCM, George W. Parker, W4NS—SEC: OPE. PAMs: ACH and LXE. RMs: MTS and OCG. Nets: Georgia Cracker Emergency Net meets on 3995 kc. Sun. at 0830, Tue. and Thurs. at 1830 EST; Georgia State Net (GSN) meets on 3590 kc. Mon., Wed., and Fri. at 1900 EST, Georgia Traffic Net meets on 3920 kc. at 0745 EST, daily except Sun. New appointments: FYC as EC for Lamar, Pike, and Monroe Counties; TGM as OO Class IV, K4FEP as OPS and ORS. EMR is new in St. Simons and is mobile with an Elmac. The Warner Robbins Club took part in the collection of toys for underprivileged children. New officers of the Club are ØRV, pres.; 5RDP, vice-pres.; K4AYT, secy.; K4ASP, treas. New hams in Moultrie are KN4ANZ and KN4APC. FGH is building a new kw. final. HYW has new kw. finals on all bands and has BERTA, WAA, 101, and CAA DX awards. FZO has a new VFO. DYR is new in Temple. DDY, in Lincolnton, is active on 75 and 80 meters. OCG reports some traffic handled on the GSN but still needs outlets in the south and central parts of the State. BYJ is active on 20- and 40-meter c.w. in Savannah. PFF reports a new club being formed in Dublin. The Atlanta Club Christmas Party was a big success. The principal guest and speaker was 1BUD. The Atlanta Hamfest will be held on May 28-29 this year with all the usual attractions. Traffic: (Dec.) K4WAR 831, W4OCG 341, BVE 218, IMQ 158, BWD 139, DDY 92, ZWT 72, CFJ 66, MTS 30, NS 28, ZD 10, DYR 6, FZO 4, (Nov.) W4YRX 114, MTS 40, HYW 16.

**WEST INDIES**—SCM, William Werner, KP4DJ—SEC: HZ. WR transmits Official Bulletins Mon., Wed., and Fri. at 7:30 P.M. AST on 3925 kc. DV transmits Official Bulletins on 1810.4 kc. Mon., Wed., and Fri. at 7:15 P.M.

(Continued on page 112)

# HARVEY Presents the Latest COLLINS COMMUNICATION EQUIPMENT for Amateur AM, CW and SSB Operation

An entirely new line of modern ham equipment designed expressly for Single Sideband as well as AM and CW. Engineering-wise, the equipment meets highest Collins standards. Price-wise, the Amateur gets more for his money than ever before. Complete specifications on request.

## 312A-1 Control/Speaker

Furnished with a removable perforated steel panel for mounting such control functions as beam direction indicators, clocks, switches, etc. A light on the top of the panel provides general illumination for the operating desk. A 10" speaker is mounted on a sub-panel behind this front panel. A terminal strip across the bottom of the open rear provides connecting points for control units. Complete with 10" PM speaker.....

**\$3750**

## 35C-2 LOW-PASS RF FILTER

Adaptable to any amateur transmitter having 52 ohm output. Insertion loss is only 0.25 db at frequencies below 30 mc, but provides about 75 db attenuation at Television frequencies.

## MECHANICAL FILTERS

Plug-in or solder-in Collins Mechanical Filters are available for 500, 455, and 250 kc. Choice of center frequencies are available for AM, CW, SSB, or FSK operation.

## 32W-1

## 75A-4

## KWS-1

## 32W-1 EXCITER

Provides 3 watts output, sufficient to drive a high-level power amplifier stage. Can be factory-converted at any time into KWS-1, 1kw transmitter. Maximum stability achieved by use of extremely stable low frequency variable oscillators and crystal controlled high frequency oscillator.

**Other Features Include:** Bandswitching on all bands from 3.5 to 30 mc with 1 kc dial subdivisions . . . Dual Conversion below 80 meters . . . Permeability-tuned, hermetically sealed VFO . . . Mechanical filter provides more than 50 db rejection of unwanted sideband in SSB operation . . . Operates either with voice-activated relay or push-to-talk switch . . . Minimum distortion with RF feedback . . . CW operation with wave shaping for minimum key clicks . . . Automatic load control . . . Provision for external FSK oscillator.

**Dimensions:** 10 1/4" h x 15 1/2" d x 17 1/4" w.

## 75A-4 RECEIVER

A further improvement of the famous, earlier 75A receivers, redesigned and modified to include SSB reception as well as AM and CW. Covers 160, 80, 40, 20, 15, 11 and 10-meter bands.

**Features Include:** Double conversion . . . Permeability-tuned, hermetically sealed VFO . . . Crystal controlled first injection oscillator . . . Mechanical filter in IF strip . . . Fast attack, slow release AVC . . . Separate detectors for SSB and AM . . . Band-pass tuning . . . New noise limiter circuit . . . Bridged-T rejection notch filter . . . Built-in crystal calibrator . . . Fixed 455 kc IF . . . Low frequency converter stage with VFO . . . Provision for 3 Collins plug-in mechanical filters.

**Dimensions:** 10 1/2" h x 17 1/4" w x 15 1/2" d. Weight: 35 lbs.

Complete with tubes (less speaker)..... **\$59500**

See Control/Speaker 312A-1

## KWS-1 TRANSMITTER

Collins engineering and extensive on-the-air testing have resulted in a top-performing transmitter for SSB, AM and CW operation. Power input is 1 kw on CW or single tone test SSSC operation, and 650 watts on AM with carrier and one sideband.

The KWS-1 actually consists of a 32W-1 Exciter with its power supply replaced by a 367A-1 Linear RF Power Amplifier, plus a 428A-1 High Voltage Supply and a 429A-1 Low Voltage Supply, housed in a supporting cabinet. Covers 80, 40, 20, 15, 11 and 10-meter bands. Pi-L tank circuit with ganged condenser and tank coil permits continuous tuning over entire frequency range. RF Amplifier employs two 4X150A tubes, operating Class AB1.

Other features are identical to those found in 32W-1 Exciter . . . including mechanical filter . . . VOX and push-to-talk operation . . . hermetically sealed VFO . . . RF feedback . . . Accurate dial calibrations, etc.

**Dimensions:** 17 3/8" w x 30" h x 15 1/2" d.

# Kuehne

A Tower of Strength  
for your  
MINIATURE BEAM

## FREE-STANDING TO 50 FT.

Safe in 80 mph winds without ugly, hazardous guy wires (something the XYL will like). Install a Kuehne tower yourself on roof or ground. It goes up quickly, easily, at low cost. Tested and proved for miniature arrays. Accommodates 1½" mast and rotor. Built of 16 ga. cold-rolled steel sections reinforced with steel gird-around ties spaced 12" apart. Zinc electro-plated finish. Cadmium-plated connecting hardware. Assembly blueprints furnished upon request of purchaser. One year parts guarantee. Order from your Kuehne Distributor. If none nearby, we will ship to your door.

## Exclusive LATERAL LOAD BEARERS

Note (Y) how bolt connects through load bearers life-time welded to side of each section leg with twin 1½" fillets. No holes in or load on joints. No horizontal bolts to tear through. Nothing stronger. Only Kuehne has it! Arrow (X) shows ventilated open joint for free moisture drainage.

No Load on Joints!

(Patent Pending)

## GIRD-AROUND CROSS TIES

Longer, stronger welds grip around OUTSIDE of vertical tubing. This heavy steel tie takes all the outward strain. None is transmitted to tower. More steel! No ripping!

Originated by Kuehne

**KUEHNE MFG. CO.**  
ANTENNA TOWER DIVISION  
MATTOON, ILLINOIS

AST. AAB uses Millen 75-watt transmitter on 144 Mc. AAA spends most of his time on 7 Mc. ABA, ABD, and ABI are on 3.7 Mc. AZ overhauled the HRO-5. DJ put up a 40-ft. all-band vertical. AAC interviewed Capt. Kurt Carlson of the *Flying Enterprise II* on WAPA-TV. KD worked E19J, G5RI, G5JU, T12BX, YV5DE, and LU3EL on 160 meters. DV, CC, and TF also are on 160 meters. W2AOX, of the *New York Herald Tribune*, is in San Juan writing a story. Senator Bauza, who backed the license plate bill, now is WP4AAS. VC's son is WP4AAT. MP is on with a kw. The first call at Polytechnic Institute is WP4ABJ. US is using cathode modulation and new antennas on 75 meters. DP is on 20-meter 'phone with new kw. and 75A-3. WD is working DX since he erected Telrex 20-meter beam. OS is giving code classes at home. WT, Dona Maria, has a new antenna on 75 meters and is heard S9 in San Juan. HZ built a 2-meter transmitter. RK received his WAC certificate. CZ operates c.w. on 3.7-Mc. mobile. Officers of the Borinquen RC, renamed the Ramey ARC, are ABE, pres.; WW, vice-pres.; ZW, secy-treas. Theory classes are held Tue. at 7:30 p.m. code classes Thurs. 7:30 p.m. AAZ, Base Commander of Ramey AFB, operates aeronautical mobile. ZD has a new 75A-3. ZA, ZQ, and ABE have Viking Rangers. ABS has a TBS-50. Traffic: (Dec.) KP4ZW 14, AAC 6. (Nov.) KP4ZW 5.

**CANAL ZONE** — SCM, Roger M. Howe, KZ5RM — NM has been appointed OPS and OO (Class III). BR and KA have their maritime mobile certificates. BE has new 813 rig and HRO-60. JJ has 10-over-15-over-20 array up. The SS *Rangitata*, bound for England, produced visitors on its last trip through the big ditch in the persons of Roy, ZL1AKL (also G3AYL), and his very charming XYL, Christine. They were met at the dock by GF, FL, ML, DG, GD, RV, KA, and RM. The party went from the dock to the home of KA and RM, where they enjoyed some very nice refreshments provided by KA and DG. Later in the evening RV took the party on a motor tour of the Pacific side of the Canal Zone and returned the visitors to their ship about midnight. Mil, GF's XYL; Virginia, RV's XYL, and Dorothy, DG's sister, also were in the group. WA reports working double 'phone patch with W4KAH on 14 Mc. using s.s.b. on the W4 end with very good results. Traffic: KZ5WA 115, KA 38, DG 25, BE 13.

## SOUTHWESTERN DIVISION

**LOS ANGELES** — SCM, Howard C. Bellman, W6YVJ — QJW, our SEC, calls to our attention the fact that more than 1400 have signed up in AREC in the section but that this figure should be near 5000 to handle emergencies properly. Howard points out that we need top c.w. and 'phone operators to man the control centers. HKD, Asst. SEC and EC for San Bernardino (also Radio Officer for Region 8 RACES), reports that the Hq. is set up under the call JBT, auspices of the Citrus Belt Club. The Fish Net, with "Kingfish" TDW presiding, held its annual Christmas affair. CMN, RM of SCN, informs us that 83 different stations handled 407 messages during December. Check in SCN some night at 1900 on 3.6 Mc. This is our official section net. The Frequency Measuring Test held in November brought three Class I qualifications: CBC, CK, and YVJ. Qualification twice a year in this manner is necessary to hold Class I and II Official Observer certificates. K6DGW is 14 years old and is a sophomore at South Gate High School. He runs 50 watts on c.w. on 80 and 40 meters. K6COP, also 14, has a rig on all bands and is a new OO. EBK conducted a Novice Class examination and now we have WN6ISX in our midst. The examiner, Johnny, loans a complete station to Novices until they receive their General Class licenses. KN6GKW has been given a taste of traffic-handling via QR and GYH. Your writer received several non-standard letters this month, including one from Scotland. R. S. Bruce, formerly of Glendale, is returning here in March or April of this year after operating GM3GVI. ORS comes through with a report. NRY is on 428 Mc. with a BC-788. The "First Annual Report" of the United Trunk Lines, West Division, has arrived from ELQ. It talks about the first year of operation and lists its members: 1 in Arizona, 10 in California, 3 in Washington, 1 in B. C., and 2 in Alaska. ELQ, the Manager, shows message totals from Nov., 1953, to Oct., 1954, which add up to 15,207. For point-to-point traffic Ed invites one and all to drop down to 3570 kc. 1915 to 2115 nightly. MLZ is acting as liaison between UTL and RN6. GYH reports that KP4ZW, ex-W6PWZ, sends 73 to the RN6 and SCN gang. Reporting from Minnesota is K6EA, who brags of having two SCMs. ZDO has finished his 1215-Mc. receiver and antenna. Carl has started test transmissions on 431.5 Mc. at 8 p.m. nightly. CFL still wants a buddy on the 2400-Mc. band. Traffic: (Dec.) K6FCZ 2245, FCY 1043, W6LYG 740, CMN 560, USY 356, BHG 212, NCP 192, K6EA/8 148, W6GYH 104, GJP 88, K6DQA 78, W6FMG 70, MBW 51, MLZ 46, YAS 46, ORS 32, CK 30, HKD 29, K6BEQ 26, W6FAI 24, KN6GKW 12, K6COP 10, W6CBO 9, AMI 3. ## designed for GROUNDED GRID

PL-6569 is a new high-mu triode, designed especially for grounded-grid amplifiers. It is THE choice for a 1-KW amplifier to follow a "100-watt" transmitter.

Its high amplification factor ( $\mu=45$ ) and its high perveance mean a power gain of *ten or more*. More than 800 watts output, with only 75 watts drive! PL-6569 is conservatively rated at 250 watts plate dissipation. Its low plate-to-filament capacitance ( $0.10\mu\text{f}$ ) makes for real stability as a grounded-grid amplifier.

**PL-6569**

A technical data sheet, giving ratings, typical operating conditions, suggested circuits . . . including single-sideband data . . . is available. Ask for Data File 301.

**PENTA**  
LABORATORIES, INC.  
312 North Nopal Street  
Santa Barbara, California

7SX. SEC: VRB. PAM: KOY. Arizona 'Phone Net: Tue. and Thurs., 7 P.M., 3865 kc. Arizona C.W. Net: Tue. and Thurs., 6 P.M., 3690 kc. This report is a combination of November and December activities. The 14th Mobile Amateur Hamfest was held in Casa Grande, but because of poor weather conditions only RYS, UDI, USX, and QZX were present. The OPRC had fine programs by NYT on "Mobile Installations," and Bob Dobinsky, of Minneapolis Honeywell, on "Controlled Circuits." It is rumored that Douglas Area is setting up a "Local Net" on approximately 3914 kc. The OPRC hidden transmitter hunt was won by QHD and QHT. RG is back on 75 meters. SUI has moved to Ohio. QZX has been appointed Asst. SEC. MES has a new Elmac transmitter and receiver in the car. IRX has moved to San Francisco. QZH has been elected to the board of directors and is president of the AARC. GSKC has moved to Glendale. PEY is back on the air with Viking Ranger, 183 receiver, and 10 and 15 beams. New calls: YGZ and YCU. Last minute scoops: Call letter license plates are now being issued to those who made application last June. The Montezuma Well Hamfest will be held May 21 and 22. Contact GYK or OAS for tickets and information. Traffic: W7LVR 18.

**SAN DIEGO** — SCM, Don Stansifer, W6LRU — Asst. SCMs: Tom Wells, 6EWU; Shelley Trotter, 6BAM; Dick Huddleston, 6DLN. SEC: VFT. ECs: BAO, BZC, DLN, HFO, HIL, HRI, IBS, KSI, KUU, and WYA. RM: ELQ. Our thanks to Roy Maxson, DEY, who has done such a good job as EC for Orange County, and has now resigned. His place has been taken by Bob Swenson, HIL. Congrats to the operators of IAB who handled 8593 messages during December, also BSD with 3227 and YDK with 3226 — a total of 15,046 for these three stations. New officers of the Silvergate Club are K6CTQ, pres.; KN6GSF, vice-pres.; KN6ITB, secy.-treas. KN6IIR got an HQ-140 and an Elmac transmitter from Santa. SYA is now on 144 Mc. with a Communicator. The Coronado Club made 119,062 points in the SS Contest with 7 stations participating. OGY will complete the term of K6AZW as corr. secy. of the Coronado Club. The San Diego Club is now incorporated. The Convair Club has completed its classes and many KN6 calls are evidence of its fine work. A night school class at Hoover High is starting, with KRO as instructor. K6CTQ now has a Ranger, thanks to Santa. We note the passing of Buddy Ascher, OZH, after a long illness. He was active on 28-Mc. 'phone for many years. KN6IWS and IWU are new Novices in the Silvergate Club. CAE is building a new final, pi-net, all bands, 4-250A final. QCA and KJR were home for Christmas. K6AAJ is heard working DX on all bands. Traffic: W6IAB 8593, BSD 3227, YDK 3226, IZG 788, ELQ 626, KVB 50, K6DBG 42, HZO 38, W6CHV 5, CRT 3.

**SANTA BARBARA** — SCM, Vincent J. Haggerty, W6IOX — K6NBI (Mac, DBY, operator) reported traffic via radiogram which was delivered to the SCM by JPP. QIW, reporting from the Ventura Area, says ERU is getting out fine with a new skyhook. MWA has 100 watts going on 2 meters. REF is moving to Oxnard. FYW reports the Paso Robles Club purchased a Viking I kit which MSG and MSW are assembling. THA also has a Viking I kit. NKT submitted an OO report. W3RNY/6, operator at K6CST in Pt. Mugu, received ORS appointment. OQX reports a new s.s.b. rig in operation. New Santa Amateur Radio Club officers are K6ATX, pres.; W6JCQ, vice-pres.; K6EAG, rec. secy.; W6AET, corr. secy.; W6ULS, treas.; K6BVZ, sgt. at arms; K6CJR, W6OQX, and W6SNI board of directors. Traffic: K6NBI 141, W6QIW 33, FYW 3.

### WEST GULF DIVISION

**NORTHERN TEXAS** — SCM, T. Bruce Craig, W5JQD — SEC: RRM. PAMs: PAK and IWQ. RMs: PCN and QHI. Santa brought LGY a Jr. Weller Soldering gun and a Heathkit VFO. WN5FBE's father died Dec. 22nd. ATG is Mayor of Dodd City. WXY is NCS for the new YL Net on Thurs. at 1:00 P.M. on 3885 kc. BDB and OM are back in Dallas for keeps. KRZ has been working Guam, Japan, and the Philippines on 15 and 20 meters. MIQW is NCS and UXY ANCS for No. Tex. Emerg. Net., which meets on 3930 kc. 8 A.M. Sun. AAO will have his kilowatt on the air soon. CDN has moved from Lubbock to San Angelo. The Abilene Amateur Radio Club assisted in a Crippled Children's Fund Drive in cooperation with the Kiwanis Club and TV station. Mobile units picked up the funds. CIP, BJL, and EOY are active with mobile units, reports TGW. CZW is looking for contacts on 144 Mc. DTA is operating portable in the Fort Worth Area. WN5FBY is working c.w. mobile on 40 meters. TJP has a new Viking II. The Texas YL Net meets each Thurs. morning on 3880 kc. at 9:30. The Dallas Amateur Radio Club's new officers are SDG, pres.; UHF, vice-pres.; and TMZ, secy.-treas. KZC and VMR, formerly of Roswell and Wichita Falls, are now being heard in Lubbock. YPI is rebuilding to a 500-watt rig and is running 5 watts on 75-meter 'phone. ZTB set up a portable rig at a Scout camp over the holidays, assisted by EFJ, FIE, and FIP. TVA is out of the hospital. UUR received an ARC-9 transmitter/receiver from MARS for

# The 1955 EDITION

OF

## THE RADIO AMATEUR'S HANDBOOK

*A*N INVALUABLE reference work and text for everyone—hams, engineers, lab men, technicians, experimenters, students, purchasing agents.

Distributors throughout the Nation have the 1955 Edition in stock. Better get your copy of this complete Handbook now. The demand is terrific!

In the pages of this latest edition will be found, in addition to accumulated knowledge since the first Handbook was issued in 1926, the latest proved findings and experiments invaluable to ham and engineer alike. Every field of ham radio is covered: transmitting, both c.w. and 'phone; receiving; propagation; antennas; construction; theory; charts; diagrams; circuits; miscellaneous data; procedures; station operation, etc.

For instance, the 1955 Edition carries

- Chapters on Theory: Electrical Laws and Circuits, Vacuum Tube Principles, High Frequency Communication, Antennas, Modulation, V.H.F. and U.H.F.
- Chapters which include How-to-make-it articles dealing with Receivers, Transmitters, Power Supplies, Radiotelephony, V.H.F., U.H.F., Antennas and Mobile Equipment, etc.
- A separate chapter on test and measuring equipment
- 67 pages of data on vacuum tubes and semiconductors, a great time-saver to both engineer and ham
- 148 pages of valuable catalog/advertising sheets, containing manufacturers' and distributors' products and services . . . a useful supplement to the editorial section
- Plus thorough treatment of such subjects as assembling and operating a station, BCI and TVI, construction practices, etc.—and fully indexed and completely illustrated throughout. You can locate in a jiffy what you want.

► \$3.00 U.S.A. Proper. \$3.50 U.S. Possessions & Canada. Elsewhere, \$4.00. Buckram bound Edition, \$5.00 everywhere. All prices postpaid.

## ADVERTISERS

“Advertising is accepted only from firms who, in the publisher’s opinion, are of established integrity and whose products secure the approval of the technical staff of the American Radio Relay League.”

Quoted from QST’s advertising rate card.

*Amateurs and Electronic Engineers: Practically everything you need can be supplied by the advertisers in QST. And you will know the product has the approval of the League’s technical staff*

Christmas. Blue Ridge (160 meter) Net is up with 92 per cent attendance. Traffic: K5FFB 1094, W5BKH 514, UBW 447, YP1 350, AHC 338, ACK 179, PAK 159, DTA/5 131, CF 72, ASA 53, RRM 38, OCV 33, YKE 29, TFP 12, LGY 3.

**OKLAHOMA** — SCM, Dr. Will G. Crandall, W5RST — Asst. SCM: Ewing Canady, 5G1Q, SEC: KY, RM: GVS, PAMs: PML, SVR, and ROZ. Message traffic has been much increased by the holidays as shown by this month’s traffic report. Sincere regret is felt at the passing of Old-Timer EZK at Enid who did much to promote amateur radio. The position of call letters in the alphabet is no longer any indication of the age of the license since the necessity of reissuance. The ACARC has issued a manual of procedure for c.w. operators which is available on request and is well worth while. CXM had a nice write-up and picture in the *Enid Morning News* as the State’s only YL EC. About half of the 77 counties in the State now have ECs but KY is asking for eligible applicants for the others. The Enid Annual Dinner and Hamfest had 103 registrations, 74 of them licensed. Among those present were the SCM, SEC, RM, two PAMs, and the local c.d. director. GIQ was MC. The North Fork Amateur Radio Club has set the date for its annual affair as May 21-22. Many thanks to those sending in traffic reports and news items. News must be of general interest to be included in this column. Traffic: (Dec.) W5GVS 451, MRK 216, MQ1 107, SVR 97, ZKK 90, PML 77, TK1 74, TC/JXM 68, ADC 65, QAC 62, KY 58, RST 43, MFX 42, REC 32, WTC 32, ITF 30, SWJ 30, WSM 27, CYQ 23, TNW 21, FEC 19, PNG 17, EHC 12, CBY 9, UTC 4, WTA 2.

**SOUTHERN TEXAS** — SCM, Dr. Charles Fermaglich, W5JFF — The Galveston County ARC participated in a recent c.d. alert. Everything in communications went off as expected. The club house was the center of communications activities. The following participated: VUS, KXA, DJD, AUN, DJC, PBY, and BPH. The GCARC is going ahead with plans to give amateur radio good publicity. DeVaney, Boles, and White gave a talk and demonstration to the Kiwanis Club. DJC now has a General Class license. DJD has a 4-watt mobile. Larry Gateley already has worked 14 states and hopes to get WAS before he gets his General Class license. FJF has been doing very nicely with a new kw. John Henry Kerby, III, has passed the Novice Class exam and soon will be on the air, portable in Arizona. WN5BTP is grinding crystals like mad, he now is Technician Class. URU has a new 813 rig on the air. CE is rebuilding and has a 75A-3. LSE is doing all the work around his house lately. The reason will be announced as soon as we know if it is male or female. Buddy Jarvis is soon to plunge into the sea of matrimony. Good luck. FEK is working hard on *HARC News* and 2 meters. SDA has a new ham shack. The HARC is progressing with its plans for a club house. Traffic: W5MIN 2326.

**NEW MEXICO** — SCM, G. Merton Sayre, W5ZU — SEC: KCW, PAM: BIW, V.H.F. PAM: FPB, RM: JZT. The NMIEPN meets on 3838 kc. Tue. and Thurs. at 1800, Sun. at 0730; the NM Breakfast Club every morning except Sun. 0700-0900 on 3838 kc.; NM C.W. Net daily on 3633 kc. at 1900. In operation “Ready” Dec. 6th, the following stations were active: ADX, AHQ, AK, AWR, BIW, BLO, BTB, BXP, CEE, CMI, DAD, DRA, DZB, EDN, FAG, FIE, FVY, GEM, GXU, GYN, HJF, LEE, KCW, KWR, NSN, NUN, OAF, PGJ, PIZ, THA, UCN, UDM, UWA, VDY, VNZ, WBG, WBJ, WPA, YFN, YIK, YPC, YWG, YWU, ZCV, ZET, ZU, and ZUV. CEE did a nice job in getting word to Canal Zone and Honduras on 21 Mc. to notify a person of his mother’s passing. CIN had a lot of mobile QSOs en route to and from Michigan. FJE and NSJ are active on 430 Mc. WNL, ECS, EEM, and UEO, in Albuquerque, recently got on 144 Mc. FPB reports that over 40 hams in Albuquerque have 144-Mc. gear. ZU got a Communicator 1 for Christmas while in San Diego. AKR worked all states but Delaware in ‘54 with 8 watts on 7042 kc. SUP reports that the Hobbs Radio Amateur Club has discussed call license plates. RES puts in a nice signal. BAQ is back with 813s. CEE and LIH visited the radio club at Portales. BHF has been on 40 meters and has a new SX-88. Ex-WN5DUB has a Viking II. Traffic: W5QR 73, AQQ 64, JZT 53, CMI 34, HJF 25, ARD 17, AK 16, WBC 16, CEE 14, ZU 10, AWR 6, BZA 2, BZB 2, BXP 1.

### CANADIAN DIVISION

**MARITIME** — SCM, Douglas C. Johnson, VE1OM — Asst. SCM: Fritz A. Webb, 1DB, SEC: RR, RMs: VE1HJ, VO6X, PAMs: VE1OC, VO2AW, VO6N, ECs: VE1AAY, VE1DQ, VO2G, VO6U. New appointee: VO1D as EC for St. John’s Area. Congrats to OO VE1BN on his showing in the November F.M.T. Les had an average error of 12.8 parts per million for four measurements! AV is doing well with new Class B modulator on 75 meters. Ex-VE1MZ now is W9IVP. ID has a new B.&W. transmitter. DQ, EC for Nova Scotia, reports the need for OPS volunteers at the provincial c.d. station. VO1Y put through his annual DX call to Santa on Christmas Eve to the delight of many VO

COMPONENTS FOR AVIONICS**

and W/VO jr. operators. VO1AE now is mobile. VO2B and VO1T are after TV DX. W9DPH is now on from VO4. W8SBS/VO2 is active from Torbay. Congrats to VO2I on the new jr. operator. W4KYM/VO6 is knocking off Ws and Gs on 160 meters. VO2G made WAC in four months on 40 meters. New executives of GBARC are VO6QG, pres.; VO6X, vice-pres.; VO6N, secy.-treas.; VO6AB, public relations. VO6U has worked 101 countries to date. VO6P is a new call at Goose. VO6O is on from Cape Harrison. VO6X recently made a trip to Montreal. Traffic: VO6AH 354, VE1FQ 333, W7SNR/VO6 275, VO6B 235, VO6N 162, VO6S 145, W4WOU/VO1 144, VE1DW 118, VO6U 117, VO6AF 76, VO1T 46, VE1OM 38, VE1AV 36, K6EJ1/VO2 33, VE1ME 23, VO1D 17, VE1DQ 10, VE1OC 6, VE1DB 2.

ONTARIO — SCM, G. Eric Farquhar, VE3IA — BXX and AGB sport new rigs and report excellent results. ANY moved to Detroit. Good luck to you, OM. AOE endeavors to get the bugs out of the 2-meter rig. AUU is convinced that there is a Santa Clause. He received a communications receiver via that route. Welcome to Kapuskasing's latest ham, VW1. AVS completed his Clapp oscillator. NN enjoyed a Florida sojourn. The Quinte Club loses its valued ex-president, Doc Bruels, recently appointed to Scarboro's Medical Center. Congratulations and good luck, OM. BSW is working on a 'scope kit. BQP has added photography to his list of hobbies and admires the results of his recent Mexican trip. To the household of VZ we extend congratulations upon the arrival of a jr. operator. It's a boy and cigars were enjoyed during the HARC meeting. Band conditions still are grim and traffic-handlers experienced difficulty moving the large volume of Christmas messages. Traffic: VE3BUR 249, AJR 180, TM 148, NO 124, DQX 56, VZ 55, AVS 47, ATR 46, EAM 34, AUU 31, PH 28, CP 23, IA 17, AOE 14.

QUEBEC — SCM, Gordon A. Lynn, VE2GL — All the VE2 gang join the rest of the Canadian amateurs in extending to VE2BE congratulations on his 25th anniversary as Canadian Division Director and wish him well for the coming years. AJE is ex-VE7ACG and has converted ARB receiver with Globe Scout 40 transmitter. AEM, KJ, APP, AOB, and EC continue the c.w. net at 0830 and 1300 daily on 3645 kc. ADU, VA, and AGI are located at Seminary of Trois Rivières. ANK is engrossed in mastering his 813. TI now operates a Viking Ranger. ATA, AOL, AUA, UB, and UZ are reported newcomers. QJ has had his call changed to AT, which was held by his father for many years. FL reports organization of the AREC in his district is proceeding apace, with the Northland Net operating on 3755 kc. at 1915 EST Wed. AGF spent three weeks in VE8-Land. DR has a new Viking Ranger. AQT is active on 75-meter n.f.m. with 400 watts. BK has ordered a 20A s.s.b. exciter. CA reports December was a busy month with traffic, also Europeans and Africans were coming in. Radio Club de Quebec (city) has ALV as president and AFC as secretary. The Club station, VE2CQ, will transmit ARRL Official Bulletins on 3740-kc. 'phone twice daily at 12:30 and 6:00 p.m. in both French and English. Traffic: (Dec.) VE2DR 143, EC 50, CP 31, FL 21, GL 17, CA 11, LO 7, BK 2, LM 2. (Nov.) VE2CA 98, EC 18, FL 7.

ALBERTA — SCM, Sydney T. Jones, VE6MJ — It is with sincere regret that we have to report the accidental death of EL, of Camrose. Don was a good operator, a brilliant technician, and will be sadly missed by all who knew him. Our deepest sympathy is extended to his wife and family, and particularly to his dad, LL. WC reports reduced activity because of other commitments. LQ has an 813 rig in the blueprint stage. HL has an 813 rig on 7-Mc. c.w. and is getting FB reports. Any amateur station in Northern Alberta is invited to check into the new C.D. Net which meets on 3765 kc. at 0900 hours Sun. NX has a new rig going and is working out well on 14 Mc. CE is checking into the B.C. Net nightly. ZR is chasing the DX. FF, IZ, MO, ON, KP, PS, and EG are active on the new C.D. Net. HM, ZR, and MJ did reasonably well in the last Frequency Measuring Test. GW is active on 14-Mc. 'phone and sports a new beam. AL has a new jr. operator and is an active ORS. XG is QRL temporarily with TVI troubles. Traffic: VE6HM 144, OD 32, MJ 10, WC 9, AL 6.

BRITISH COLUMBIA — SCM, Peter McIntyre, VE7JT — Last month there was no column because of the press of business and the season activities. Thanks to the two who took the time to write after reading the last published column, namely 6MJ and 7AKD, who both touched on the lack of old-time ham spirit. US was the guest speaker at the VARC meeting where he gave an excellent talk on s.s.b. which was well received. Wilf reports that VE7s ABU, AKA, AKN, ALW, BV, TV, and YY are either on or getting on with s.s.b. and that there are 10 phase shift networks and 5 slicers floating around the Province ready for operation. The AREC has been having a rough time with band conditions very poor, QRM from VE4s, 5s, 6s and other sorts of sundry unmodulated carriers. There are some ECs throughout the Province who forget that reports to DII are necessary, so start reporting, fellows, or at least tell DII you are no longer interested. The AREC Net covers a large amount

**NEW!**  
**Johnson Viking**  
**ADVENTURER**  
**CW Transmitter Kit**

Work round the world with the ADVENTURER . . . the perfect transmitter kit for both novice and experienced amateur. Completely self-contained.

Loaded with new features:

- Power Input — 50 Watts • Effectively TVI suppressed
- Pi-network output tuning — no antenna tuner needed
- Single-Knob Bandswitching on 80, 40, 20, 15, 11 and 10 meters
- Extremely compact in size — only 7 3/4" high x 10 3/4" wide x 8 1/4" deep.

No. 240-181-1 VIKING ADVENTURER Kit with tubes, less crystals and key. Complete with easy assembly directions and operating instructions. **\$54.95**

**TERMINAL Regularly Stocks**

these Famous JOHNSON Ham Favorites:—

Viking Ranger • Viking II • Viking VFO • Viking Mobile VFO • all in either Kit Form or factory wired • Johnson's Civilian Defense Viking II • Low Pass Filter • Standing Wave Ratio Bridge • Signal Sentry • Matchbox • Bi-Net and Whipload as well as Johnson parts. Contact W2BUS for information, data sheets and quotations.

**NEW!**  
**GONSET** *Monitone*  
**MODEL 3022**

**3 Way Code Oscillator**

No need to tie up dollars in an instrument which can be used only for code practice purposes. The NEW MONITONE is a multi-purpose instrument — can be used three ways: Code Oscillator, Phone Monitor and CW Monitor. Has no shock hazard on the keying system. Can be used with any CW Transmitter to monitor code sending as well as transmitter keying characteristics. At the flip of a switch it can be used as a monitor for speech quality in conjunction with a radiotelephone transmitter. Size 6 3/4" wide x 5 1/4" high x 4" deep — 115 volt AC **\$19.50**

**NEW!** Model 3057 GONSET 2 Meter DE LUXE COMMUNICATOR in 12 VDC/117VAC **\$229.50**

**NEW!** Model 3049 GONSET 6 Meter DE LUXE COMMUNICATOR in 6 VDC/117VAC **\$229.50**

Also Model 3058 in 12 VDC/117VAC **\$229.50**

**NEW!** GONSET 500W SSB, AM or CW Linear RF Power Amplifier **\$395.00**

TERMINAL distributes all of GONSET'S Communications Equipment for Amateur, Commercial and Private Aircraft.

**NEW!**

**Hallicrafter S-38D Receiver**

The new and completely revised model of the old S-38C — 5 tubes AC-DC with built-in speaker — 540 Kc to 32 Mc with 4 Band selector plus band spread tuning **\$49.95**

The newest and most complete line of HALLCRAFTER always available at TERMINAL: S-38-D • S-85 • S-86 • S-94 • S-95 • SX-62-A • SX-88 and SX-96. Write W2BUS for further information on availability and prices.

## PHILCO

### TECH-REP DIVISION

#### Offers Such Opportunities

. . . to men who are qualified by experience or training in the design, maintenance and instruction of Communications, Radar and Sonar Equipment.

#### FUTURE OPPORTUNITY & JOB SECURITY

. . . are more than "sales talk" at Philco, where the continuous demand of electronics installation and service work throughout the entire world, which have been coming to us with increasing regularity since 1941, have made us the "pioneer" in this field.

#### PLUS . . . OF COURSE

. . . the very important fact that in the civilian radio & television field, PHILCO has led the industry for 20 straight years.

#### TOP COMPENSATION

. . . salary commensurate with education and experience PLUS hospitalization, group insurance, profit sharing, retirement benefits, merit and faithful service salary increases and paid vacations.

#### LOCAL INTERVIEW ARRANGED

##### Write NOW For

. . . our special literature on COMMUNICATIONS & RADAR JOB OPPORTUNITIES NOW AVAILABLE AT PHILCO.

### PHILCO TECH-REP DIVISION

22nd & Lehigh Ave., Philadelphia 32, Pa.

of territory now, with check-ins from the Yukon, N.W.T., and Alberta on a regular roll call. Hope you all enjoyed the festive season and are on the road to a good 1955. Yours truly wants to know when the next hidden transmitter hunt will be. Not where, but when. Traffic: (Dec.) VE7QC 48, XY 35, DH 20. (Nov.) VE7QC 55, DH 32, KL 27, ZV 19.

**SASKATCHEWAN** — SCM, Harold R. Horn, VE5HR — DR attended the "Communications Planning Course" held at Arnprior, Ontario, Civil Defense College, and reports that much information was gained and many ideas were exchanged on ways to put communications to good use during an emergency. A good number of amateurs attended. CX reports that EB was married on Dec. 7th, with JG, BO, RU, EB, and their XYs in attendance. RU worked 45 countries the past summer with his 80 watts and a two-element vertical on his trailer. Ex-5JS now is 7IW at Kelowna. PW works 21 Mc. and likes that band. BG has a new Viking Ranger. RG is back on 75 meters after being QRT for a long time. MX is heard on 14 and 3.5 Mc. with his Viking. LM is now located at Saskatoon and BC at Swift Current. AT was the only VE west of Ontario to report during the B.E.R.U. Contest. BZ is a new OBS and can be heard on 3740 kc. at 1800 hours MST Tue., Thurs., and Sat. Because of poor band conditions the 'phone net has been practically extinct but it is hoped that members will be on the watch for any traffic when the band is open. Traffic: VE5GX 4.

### Frequency Marker

(Continued from page 15)

controlling oscillator by factors of more than 10. Suitable low-frequency crystals, including those operating at 450 kc., and which should be as useful as those already mentioned, are available as surplus material for \$2.00 or less each.

A crystal-controlled frequency marker such as is described here can be built for from \$15 to \$20 if all parts, including the crystal, must be purchased new. Of course, if the receiver is provided with suitable power-supply terminals, filament and plate power could be taken from the receiver, in which case the cost can be still further reduced by omitting the filament transformer and rectifier-filter system.

The high precision and small size of this self-contained unit make it an especially useful piece of equipment for the radio amateur.

### Overtone Crystals

(Continued from page 17)

more capacitor than the circuit of Fig. 2A, and it will usually work well with crystals of either the overtone or fundamental variety interchangeably. We've used it repeatedly for 3rd-overtone work with crystals in the 6- to 9-Mc. range, and have had no trouble getting 5th-overtone oscillation with 3.5-Mc. crystals.

In some applications it may be desirable to have the crystal oscillator as high in frequency as possible. This is particularly true of crystal-controlled converters, where energy at frequencies other than the desired one may cause birdies and spurious responses. For converter use the circuit of Fig. 2C may have merit. This was suggested to the writer by Clare Reynolds, W9MBI, of the James Knights Crystal Co., Sandwich, Ill. He uses it in v.h.f. converters, and has also had direct control of an oscillator at 144 Mc. in a low-powered 2-meter transmitter. He

reports that frequencies as high as 216 Mc. have been obtained with direct control, involving overtones as high as the 11th, with this circuit.

The critical element here is the value of the two resistors on either side of the crystal. Increasing them causes more feed-back, encouraging the tendency to self-oscillation and "squegging." Dropping their value much below that specified cuts out oscillation altogether. We checked many types of fundamental crystals in this circuit in the Headquarters lab, with the usual result: In going through dozens of crystals in the range between 6 and 9 Mc., we found only two that could be made to oscillate on overtones higher than the 5th, and very few would even go this high, though all worked well on the 3rd. However, when we checked about 20 overtone crystals, higher overtones were found with ease. With any 3rd-mode crystal, the 5th and 7th modes were found in every case, and in most instances the 9th was usable. Third-overtone crystals around 12 to 15 Mc. (fundamental 4 to 5 Mc.) could be operated on their 9th, 11th and even higher overtones in some instances. Several v.h.f. crystals from the International Crystal Co., Oklahoma City, for frequencies between 40 and 50 Mc. were made to oscillate as high as 150 Mc. These were 3rd-overtone crystals in CR7-type holders.

### Precautions with Overtone Crystals

Too many hams regard the frequency marked on a crystal holder as a fixed value, to be relied upon regardless of how the crystal is used. It should be borne in mind that even when the crystal is used at the fundamental frequency, the value marked on the holder applies only to the conditions under which the crystal was checked by the manufacturer. Changing the load capacitance into which the crystal works, using it in different circuits, or running it hotter than the manufacturer specifies, can make the frequency something quite different. Exact calibration may not be important unless you are planning to work close to band edges, but staying within the recommended operating conditions as to crystal current is important, if you want stability.

Most overtone crystals, being of the plated variety, are incapable of dissipating much heat. This means that the crystal oscillator must be operated at low power level, and with no more feed-back than is necessary to maintain good starting characteristics under load. The crystal oscillator should never be thought of as a power-generating device, and this is particularly true of overtone oscillators. The oscillator should generate a stable signal; stepping up the power should be left to succeeding stages.

When fundamental crystals are used on overtones, the frequency of oscillation may not be an exact multiple of the marked frequency. And the frequency will be different for series or parallel resonance. Moral: When working anywhere near band edges, have some accurate means of checking frequency; a crystal marking is no guarantee that you will be inside the band.

# Test your QRK \*

Here's a little quiz based on articles appearing in *QST* for January. How much do you remember from the issue of two months ago?

1. What antenna popular during the 10-meter opening in the '40s has been revived as a 20-meter beam?
2. An average car antenna is just the right length for which amateur band?
3. Use of the grounded grid amplifier eliminates what troublesome problem?
4. The League recently filed comment on FCC Docket 11157. What does this docket propose?
5. What contests were held by ARRL during January?

Whether you got them all right or not isn't too important. What is important is the fact that whenever you need information about ham radio—antennas, mobile gear, transmitters, regulatory developments, operating events or other amateur matters—the right answer is in *QST*.

For accurate, complete and up-to-date coverage of your favorite hobby, get *QST* delivered to your door every month.

## Answers

1. *The Cubical Quad* (A Cubical Quad for 20 Meters, page 21) 2. *Six Meters* (A Simple Rig for Six-Meter Mobile, page 28) 3. *The need for neutralization* (Grounded-Grid and the 304-TT, page 33) 4. *Expansion of Technician privileges to six and two meters* (Happenings of the Month, page 48) 5. *The Novice Round-up and the VHF Sweepstakes* (pages 59 and 53, respectively)

\* QRK—*QST* Reading Knowledge. It is also the International Q-Signal meaning "Your readability is . . .". You'll find *QST* always QRK 5—Perfectly Readable.

The common test for self-oscillation, pulling out the crystal to see if oscillation stops, is not applicable to most overtone circuits. The capacitance of the crystal and its holder is a part of the feed-back circuit. If there is self-oscillation present, it will almost invariably stop when the crystal is removed.

In trying for high-order overtones, it may be necessary to bring feed-back up to the point where self-oscillation develops when the tuned circuits are resonated at frequencies away from the desired overtone. If a receiver covering the range is available, the self-oscillation frequency may be checked as the circuits are varied. When the desired overtone is approached there will usually be a sudden jump in frequency to that overtone, whereupon the signal (with b.f.o. on) will become stable and musical in tone, instead of raspy and subject to frequency shift during even slight mechanical vibration. Adjustment of such circuits is critical, and it usually will not be right for more than one crystal.

The tuning of circuits associated with overtone crystals affects the frequency of oscillation appreciably. There may be shifts of 50 kc. or more in the 144-Mc. band when tuning overtone circuits. Thus it can be seen that they are unsuited to shaving the band edges.

### To Use or Not To Use?

From what we have said here it can be seen that the ability to work with direct crystal control in the v.h.f. range is not an unalloyed blessing. There are applications, however, where overtone techniques have much to recommend them. They are almost a must in crystal-controlled converters, for instance. Here you want freedom from birdies in the form of crystal harmonics, and you also want the energy you inject into the mixer to be as free as possible from frequencies other than the desired one. If you can get direct control at the injection frequency in your crystal-controlled converter, by all means do it. The power output required is, of course, very low, so you can achieve high stability in your converter readily. And you're not going to change injection frequencies, so critical adjustment is not an important deterrent. You're going to have to do the job only once.

Third-overtone operation of cheap and plentiful surplus crystals in the 8-Mc. range is often a convenient and economical way of controlling the frequency of v.h.f. transmitters. If circuit simplicity and low power drain are important considerations, along with low cost, overtone circuits are certainly attractive.

But suppose you're going to build an exciter that you hope to use on several bands. You want the oscillator to work with 3.5-, 6-, 7-, 8-, 12- or 14-Mc. crystals, so as to make use of a stock you have on hand. Quite likely, you'll want to have a VFO to work into the crystal-oscillator stage, too. Simplicity and low first cost are minor considerations in such a design, compared to the convenience of being able to use any type of crystal. Stability and more reliable frequency calibration

# SHAFT COUPLINGS

Building it yourself? Then use JOHNSON couplings. Capable of many thousands of operating cycles without failure due to fatigue—manufactured with high quality, low loss insulation. All metal parts accurately machined and suitably finished. Phosphor bronze springs on the -250 and -251 series shaft couplings provide flexibility without backlash and adjust to minor shaft misalignments. Rigid types such as the -250 and -262 will meet requirements of accurate shaft alignment and high torque. The -259 is a bar type shaft coupling recommended for high voltages or very high frequencies—the -264 is a small bakelite insulated shaft coupling for DC or low voltage RF applications.

**FLEXIBLE SHAFTS**—Perfect for out-of-line or up to 90 degree angular control—phosphor bronze, non-rusting flexible shafts with 1/4" nickel plated brass hubs.

**PANEL BEARING ASSEMBLIES**—Panel bearings for 1/4" shafts and rigid 3" and 6" nickel plated brass shafts assembled in panel bearings. Shafts are 1/4"; bearings, furnished complete with 3/8"-24 nut, can be mounted on panels up to 3/8" thick. Special shaft lengths and locking type bearing assemblies available on special order.

are important here, too. Overtone circuits are out for such applications, obviously. You'll build this rig with all the customary TVI-prevention measures, anyway, so the possibility that unwanted multiples of the oscillator frequencies may appear in the output is of little importance. A careful consideration of all the design factors will enable you to make a wise choice as to whether overtone-oscillator techniques are attractive for the job you have in view.

## Antenna Coupler

(Continued from page 19)

harmonic attenuation. Note the similarity of Fig. 3B to a low-pass filter section. It should be possible to match either 52- or 72-ohm coax without difficulty.

The nominal rating of the components used is 500 watts. The major operating precaution is not to operate the circuit switch  $S_1$  with the power applied. These switches can carry quite a bit more current than they can break. The same precaution applies with somewhat lesser weight to  $S_2$  and  $L_1$ .

The L-C matching section may be used by itself for matching grounded antennas by bringing the antenna line in and tapping into the coupler at the point marked "X" in Fig. 1. No coil should be plugged in the jackbar, and switch  $S_1$  must be in position 2 or 3. The only precaution is to observe the voltage ratings of the capacitors in the matching section.

If the same type of ceramic stand-offs are used as those in the photographs, be extremely careful when mounting them to the metal panel, as they break very easily. Fiber washers under the nuts and between the ceramic and the panel should help considerably.

## HAMFEST CALENDAR

**PUERTO RICO**—The 1955 PRARC Hamfest will be conducted on Sunday, March 20th, on the Island of Puerto Rico, the exact location to be announced in the Club's bulletin, *Ground Wave*. There will be talks and demonstrations of TV, TVI and ITV. No changes in admissions from those of last year. U. S. and foreign amateurs desiring hotel accommodations should contact KP4DU for arrangements.

**WASHINGTON**—The Bremerton Amateur Radio Association will hold a hamfest on March 5th at the Elks Temple, 5th & Pacific, Bremerton. Registration will be at 1:00 P.M. The banquet starts at 7:00 P.M. A chicken dinner, country style, will be served. The price is \$4.00 per person. There will be a dance later in the evening. Fun for all. Tickets may be ordered in advance from Allen R. Nelson, W7GUS, Box 103, Port Orchard, Wash.

**OHIO**—Saturday, April 2nd, at the Dayton Biltmore, Dayton—the Dayton Amateur Radio Association will hold its annual Hamvention. Hamvention is the best treat in ham radio—ask anyone who has attended. The day-long program will feature outstanding speakers on all phases of amateur radio and a special program has been prepared for the ladies. The affair will wind up with a banquet at 7 P.M. in the hotel ballroom. Tickets are \$5.00 in advance or \$5.50 at the door. Reservations, more information and an attractive brochure may be obtained from D.A.R.A., P.O. Box 44, Dayton 1, Ohio.

# LAFAYETTE'S SPECTACULAR MULTITESTER VALUES

## Lafayette Greatest Tape Buy Ever!

**\$1.89** per roll plus postage (C.O.D. accepted)

al-quality recording tape obtainable. Highest performance for thousands of playings. Red Oxide Base in a smooth, uniform coating; greater signal strength; with maximum fidelity; uniform frequency response from 40-15,000 cps.

In lots of 10 rolls - 1.75 ea

1200 FT. REEL  
Genuine Plastic Base  
RECORDING TAPE

## HIGH SENSITIVITY AC-DC MULTITESTER 20,000 ohms per Volt

The new Lafayette High Sensitivity Multitester is a complete instrument (not a kit). Here is an instrument packed with every desirable feature found only in instruments costing twice as much. One of the most sensitive multitesters ever offered. 20,000 ohms per volt DC; 8,000 ohms AC, having a high sensitivity 45 microamps meter. Full scale AC-DC voltage ranges are 0-10V, 0-50V, 0-250V, 0-500V, 0-1,000V; DC current ranges 50 microamps, 2.5 ma, 25 ma, 250 ma. Resistance: 0-5K ohms, 0-50K ohms, 0-500K and 0-5 megohms. Decibel range: -20 +5 db; +5 +22 db (0 db -0.775V-600 ohms). Extreme versatility and accuracy. 1% precision resistors; beautiful plastic front, with metal bottom for ruggedness. Size: 3 3/4" x 5 1/2" x 2 1/2". Complete with batteries and leads. Shpg. Wt. 4 lbs.

RW-30G.....NET **19.95**  
In lots of 3 **19.25**

## NEW POCKET AC-DC VOM MULTITESTER 1,000 ohms per Volt

This instrument is one of the best buys that Lafayette has ever offered in a Wide Range AC-DC MULTITESTER. An ideal portable unit that meets the need for a compact, yet rugged test instrument. Has ease of operation usually found only in MORE EXPENSIVE INSTRUMENTS. Has 1000 ohms/volt sensitivity on both AC or DC. Uses full 3" rectangular meter with large easy to read scale. Uses 1% precision resistors, jeweled D'Arsonval microamp meter movement. Ranges: AC-DC and output volts 0-5, 0-25, 0-250, 0-1000V; DC current 0-1, 0-10, 0-100, 0-1000 mA; Resistance 0-10K and 0-100K ohms. In handsome sturdy bakelite case. Size: 4 1/4" x 3 1/4" x 1 1/4". Supplied Complete with test leads and batteries. A Must for every serviceman, shop, laboratory or experimenter—and at Lafayette's Price you can afford to own one. Shpg. Wt. 2 1/2 lbs.

MODEL RW-27C—Complete In Lots of 3, **9.45**  
Single, ea. **9.95**

## High Output Dynamic Microphone Worth Many Times Its Price

AT LAST! A Hi-Fi Dynamic Mike for Public Address etc., at a price you'd expect to pay for a good crystal mike!

Lafayette went abroad to obtain a high quality DYNAMIC MICROPHONE at a price that is 70% less than any comparable dynamic microphone on the market today. Exceptionally fine for public address, recording and other general purpose use. Substantially flat response, 60-10,000 cps, assures faithful reproduction of speech and music. Impedance 10,000 ohms  $\pm 15\%$  at 1000 cps. Output Level -55 db. Die cast metal case finished in light grey and fine chromium. Compact and light weight. Net Wt. 1 lb. Head at fixed tilt of 15°, equipped with 6 ft. well shielded low-loss special vinyl-jacketed cord. Standard 5/16"-27 thread. Dimensions 1-23/32" high, 2" wide, 3 3/4" deep. Shpg. Wt. 3 lbs.

## LAFAYETTE EXCLUSIVE! DYNAMIC EAR PHONE

A new lightweight plastic ear phone especially imported by Lafayette to bring you the high quality of a dynamic ear phone with the ease and comfort of an almost weightless unit—at a price less than half that of any comparable unit. Fits right into ear. Excellent sensitivity of 85 db. Ideal for use with miniature sets, hearing aids, transcribing, etc. DC resistance 2000 ohms, impedance 5000 ohms at 1000 cycles. Complete with 3 ft. plastic covered cord.

EXCELLENT FOR SILENT LISTENING OR VIEWING  
Will replace speaker on any radio set or T.V. for silent listening, by direct connection to secondary of output transformer.

# Air-System Sockets

**Eimac** air-system sockets are custom designed to provide adequate cooling with the most economical blower requirements for several Eimac radial-beam power tetrodes.

**4-400A 4000** air-system socket is employed with Eimac tube type 4-400A. Air enters through the bottom of the socket and is guided by a pyrex glass chimney, assuring efficient cooling of the various seals. If desired, this socket may also be used with Eimac 4-125A and 4-250A.

**4-1000A 4000** air-system socket is designed for use with Eimac tube type 4-1000A. Air entering the bottom of the socket is guided by a pyrex glass chimney toward the plate seal, assuring correct cooling even during maximum rating operation of the tube.

**4X150A 4000** air-system socket provides adequate air cooling and high frequency circuit arrangement for Eimac 4X150A and 4X150D. Air enters the socket through the bottom and is guided by a ceramic chimney.

**4X150A 4010** socket is identical to the 4X150A 4000 except that this socket is complete with grounded cathode connecting tabs.

Eimac air-system sockets and chimneys are also available as separate units.

## Receiver Design

(Continued from page 21)

worked; however, instability, tracking difficulties, and oscillator pulling were quite bad above 7 Mc. This condition was attributed to insufficient frequency separation and the consequent reactance of the local oscillator circuit coupled into the cathode of the mixer, producing sufficient phase shift to cause oscillation in the mixer and pulling of the local oscillator frequency. Again, the 6C4 cathode follower provided a practical solution, by giving necessary isolation, resulting in a cool, smooth-running low-noise mixer. No further difficulty with tracking was encountered.

### Circuitry

Fig. 1 shows our low-noise front-end circuit. No a.v.c. should be used on the first r.f. stage. It should be emphasized that in order to utilize the grounded-grid triode mixer it is imperative to use a separate h.f. oscillator. Although a converter circuit may appear complicated, a little study will reveal that it consists of simple triode-oscillator, signal-input and i.f. output circuits. Fig. 2 illustrates modification of two common types of single-tube converters to separate oscillator mixers for use in this low-noise front end. There is nothing tricky about making this modification. One precaution: connect all grounds to the cathode return of the stage being wired. The use of tube shields for all the 6C4s is recommended, especially if they are mounted below deck, as was the case in our receiver. Although major realignment will not be necessary, a touch-up of the trimmer capacitors at the high end of each band may be required. Readjust the oscillator trimmers first to bring the receiver back into calibration; then the r.f. and mixer trimmers for maximum gain.

### Conclusion

Here is a circuit that for the first time makes practical the use of low-noise techniques in general-coverage receivers. It is easily applied to any receiver without introducing additional knobs or alterations to existing tuned circuits and, furthermore, works at the first try. The few extra wires and components are well worth the time and expense. Comparative listening tests were made on 14 Mc., between a receiver incorporating this circuit and three late-model stock commercial receivers in the \$400.00 class. Listening fatigue attributable to internal noise was considerably less, and twice as many DX stations were heard.

## Strays

WEAR, WEAR-TV, and W4EAR are all in Pensacola, Fla., and within about three air-line miles of each other. You guessed it — W4EAR is in the middle, too!

## Multimatch Antenna System

(Continued from page 23)

again, the capacitor is made up of concentric aluminum or dural tubing separated with polystyrene, and the coil is concentric. In each capacitor, the polystyrene insert (Fig. 4) should provide a tight fit to both sections of tubing, and the insert should be driven into the outer conductor to the shoulder. The inner conductor should be driven into the insert for a distance of  $2\frac{3}{4}$  inches (thus protruding 2 inches inside the outer conductor). This gives a capacitance of approximately 25  $\mu$ f. The trap inductors are wound with No. 8 wire. The 10-meter inductors have 5 turns  $2\frac{1}{2}$  inches in diameter, with the turns spaced approximately  $\frac{1}{2}$  inch. The 21-Mc. inductors are similar, but have 7 turns. As with the wire-antenna traps, the inductors should be adjusted for resonance near the center of each band before they are installed. The ends of the inductors are wound around the element sections and fastened with clamps. The array is fed with a T match to 75-ohm Twin Lead.

Fig. 3 shows the element dimensions used by the author. Antennas of this type, in both wire and beam forms, have been installed by many amateurs, using traps constructed by the author. Without exception, all have been enthusiastic about the performance.

## "Hidden Gem"

(Continued from page 24)

A Vari-Loopstick is used for  $L_1$ , as suggested by W8E1Y. It is a commercial slug-tuned inductance which is widely used as a broadcast-receiver antenna. It sells for less than a dollar, and requires only a small hole for mounting. It comprises a very compact, adjustable tuned circuit consisting of its self-inductance and the distributed and stray capacitance of the circuit. It peaks very nicely on 75 meters using a transmitter or grid-dip meter as a signal source. Once the Vari-Loopstick is peaked at 75 meters, no further adjustment is ever necessary, since it is broad enough to cover the entire 75-meter band, and the increased radiation efficiencies on the higher-frequency bands more than compensate for the lack of a tuned circuit.

When it comes to the pick-up antenna, you can really let your imagination go to work. Only a short vertical probe from 4 to 8 inches in length is necessary if mounted on the rear gravel skirt or on the rear-window deck. An unused broadcast-receiver whip is efficient and inconspicuous. The antenna used here is a right front-fender guide which is insulated from the car body. This serves double duty because it works well as a pick-up antenna and helps the XYL in parking. Any insulated wire serves as a lead-in to the meter.

**Filter Capacitor for  
SSB Transmitter Power Supply**

ORDER BY MAIL, PHONE, WIRE, OR IN PERSON!

**Worth Over \$110**

**\$69<sup>50</sup>**

Exclusive at Radio Shack! Sorry we can't tell you the famous make of this capacitor, rated at 50 mf at 3 KV (dc), but it's brand new — NOT gov't or other surplus — and fully guaranteed. Provides excellent dynamic regulation and optimum power output when filtering power supply for voice frequency, especially in low frequency syllabic loading, in suppressed carrier single side-band transmitter operation. Mild steel construction, finished gray. Size: 13 1/2" wide, 5 1/4" deep, 14 1/2" high. Insulator bushing and stud terminal 4" high. Mounting center 15 3/8" for 3/8" bolts. Allow for 75 lb. ship. wt. NOTE: the quantity is very limited — first come, first served.

REFERENCE: See G-E "Ham News" of Jan.-Feb. and March-April 1954 for data on better dynamic regulation and power supply design. The value of this capacitor will then be even more fully appreciated.

## Using the F. S. Indicator

Once your field-strength indicator is installed, it may reveal some surprising facts about your transmitting system. For instance, you may find that maximum output does not occur at the plate-current dip but somewhere off to one side. You may find that output does not continue to increase with increased coupling, even if the plate current does go up and you still are able to get a plate dip. A point is sometimes reached where increased coupling merely heats your final amplifier and the transmission line, and actually decreases power output. If your grid drive is adjustable, you may find that there is an optimum setting for it, too. Too much drive may drop the output just as too little will. You will be able to find the exact frequency at which your antenna system radiates best and you will be able to prune your antenna to any desired frequency. The system followed here to QSY the antenna on 75 meters is to use capacity sprigs clipped on the antenna above the loading coil. The sprigs are short lengths of stiff copper wire and attached to small battery clips. If the antenna itself is tuned to the high end of the band, four sprigs of different lengths will enable you to cover most of the band with reasonable efficiency and will spot five frequencies for maximum output. If you are using one of the new continuously-variable loading coils, your field-strength indicator will help you to determine the correct tuning in a hurry.

And not the least value of this gadget is its ability to let you know that you're actually radiating. You won't have to tear the transmitter apart or run a special check when you fail to raise a station, if your meter is indicating normal output. You can just conclude that the other guy is deaf or has left the antenna off his receiver.

The sensitivity control should be turned all the way down when the indicator is not in use to protect the movement from overload if you should get too close to a strong commercial station. This also damps the meter against mechanical vibration.

The indicator can be constructed in a couple of hours, and attached to your car in even less time. About the only cost of any consequence is the meter movement, but almost everyone should have some meter available which can be used. Remember, the larger the pick-up antenna and the closer it is placed to the radiating antenna, the less sensitive the meter movement required. With fifty watts input, a 150- $\mu$ a. movement is more than ample when using the fender-guide pick-up.

No matter whether you're running a mobile kilowatt or only a half pint, whether you have a super high-Q antenna or just a piece of wire, a mobile field-strength indicator will at least result in the self-satisfaction of knowing when you are getting the maximum available output from your system. It will also let you know if changes in your system are of any benefit, and should result in more and better QSOs. You probably will discover other uses and applications yourself.

## BLOWERS

for every Electronic Application

These dependable blowers pay for themselves immediately by up-rating tube and component capabilities to their higher forced ventilation limits. Lowered operating temperatures also reduce equipment failures, extending useful service life.

Standard production part with leading makers of transmitters, induction heaters, calculators, radar, etc., particularly to enable compacting more performance into smaller space.

### Model RO-50

Most popular WHISPER-QUIET small blower. Delivers 50 CFM (44 CFM at .25 inch static pressure). 115 Volt 60 cycle 2600 RPM shaded pole (brushless) motor creates no electrical interference. Draws only 40 watts. Over-size, self-aligning bearings for cool, trouble-free performance. 5 3/4" high, 5 1/4" wide, projects 6-5/16" from mounting flange. 2 1/8" dia. discharge. Shipping weight 5 lbs. Immediate shipment from stock.

## Transmitter Hunting

(Continued from page 27)

his call), the hidden transmitter, inviting all mobiles on 29 megacycles to participate in tonight's hidden-transmitter hunt. We are in the south sector (or north sector if he is in the north half of the city). We shall start the hunt with a roll call. All participating stations please identify themselves. This is W7QPR mobile, the bunny. By." During this transmission the participating stations take a bearing, determine the axis, and possibly the direction of the hidden transmitter, and start after him, announcing their calls for the roll call. After the initial transmission, the bunny may remain silent until he is called. When he is called, he transmits for fifteen or twenty seconds, allowing the pack to get a "fix" on him. The idea is to ask for as few transmissions as are necessary, because each time a participating station asks for a transmission, the whole group takes a bearing.

On a typical hunt, the first bearing was taken at point A, Fig. 3, and this indicated a northeast-

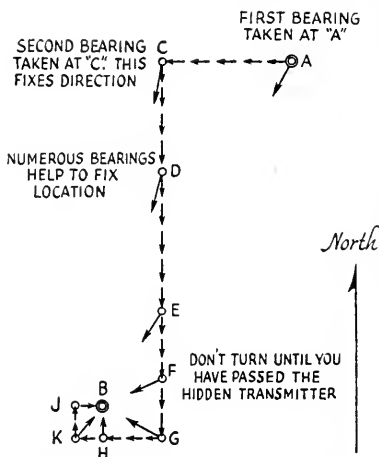

Fig. 3—Diagram of a typical transmitter hunt following the "spiral" system described in the text.

to-southwest axis (A to B). The author drove about a mile westward to point C and called for a transmission. The bearing then appeared in a more north-to-south direction, indicating that the bunny was definitely to the south and a little west. Driving south (the streets run due north and south), bearings were taken at D, E, and F, as other mobiles called for transmissions. By this time, the author's XYL, who was the copilot, and the two junior ops in the back seat were calling for a turn to the west. At G, a transmission was asked for and it indicated that the author was south of the bunny's east-to-west axis. So, turning west, bearings were taken at points H and K. Position K showed that the author was west of the north-to-south axis of the hidden transmitter. The author then drove northward very slowly. At J, a bearing was taken which

## OWNERS OF JOHNSON VIKING II TRANSMITTERS

NOW you too can have sparkling single sideband performance from this fine transmitter. Add the B&W 51SB Single Sideband Generator to your Viking II, and you'll enjoy all the operating characteristics you now get *plus* the superior effectiveness of SSB transmission. Here are just a few of the features of the B&W 51SB:

- Complete bandswitching from 80 to 10 meters • Operates with either crystal control or VFO of your Viking • Voice control operation on SSB • Speaker deactivating circuit

The 51SB comes to you ready for hook-up to your Viking. Complete instructions and necessary modification kit are of course included.

Construction of the 51SB is completely unitized. The equipment can easily be removed in three major sub-assemblies: R-F Unit, Audio Unit, and Main Chassis Unit. It's entirely self-contained except for microphone.

GET THE FACTS! Write B&W now for Bulletin 51SB, or see this new SSB generator at your distributors'.

## ORIGINAL VAARO MOBILE PRODUCTS

## NOW MADE BY DAVIS ELECTRONICS

### ORIGINAL VARIABLE SINGLE UNIT COIL

For 75-40-20-15-11 and 10 METER BANDS.

NOW IN THE 1955 DESIGN WITH THE NEW, IMPROVED "DUAL CONTACT" between the coil windings to provide a greater, more positive, more efficient contact. Coil can be INSTANTLY TUNED to ANY DESIRED BAND or FREQUENCY by ingenious locking device. Factory pretuned. Continuous coverage from 3750 kcs. to 30,000 kcs. Highest "Q" available in an all-band coil. Fits all whips and bases.

MODEL V-102B—for 0 to 500 watts input

**\$14.95**

MODEL V-103B—for 0 to 1000 watts input

**\$16.95**

**VAARO BUMPER MOUNT** Eliminates cutting holes in your car. Fits any antenna and car bumper. BUMPER CURVATURE INSERT exactly fits your make and model of car. Socket dimensions: Standard 3/8" x 24 thread. Has .500 thick fibreglas disc of top dielectric material. MODEL V-105. Cast aluminum. Hammertone baked enamel, **\$13.95**

MODEL V-105V. Guaranteed 5 years against corrosion and flaking. Cast bronze. Heavy chrome and copper under-plating, **\$25.95**

### VAARO "WHIP FLEXOR"

keeps whip perpendicular at high speeds—thus no change in loading or impairment of reception. Cuts down bad "QSB" action on receiving end. Whip can be brought into horizontal plane for car storage, etc. Has strong cadmium-plated square steel wire spring. Only **\$3.95**

The DAVIS-VAARO Line also includes: FIBREGLAS WHIPS—6' \$8.50, 7' \$8.75, and 8' \$8.95. Also BASE SECTIONS (Solid Hex); 12" \$3.75. 24" \$3.95. 36" \$4.95.

**VAARO "WHIP CLAMP"** — Securely fastens to roof water-drain of any car without damage to finish. Fastens whip securely down to car roof level for storage, low wooded areas, etc. Solid brass, chrome plated. Installed in 30 seconds. **\$1.79**

## CASCADE CRYSTAL CONTROLLED CONVERTER for 144 or 220 Mc.

### Provides:

- **HIGH SENSITIVITY** — Sensitivity better than 1/10 microvolt. Gain approx. 30 db. Noise approx. 4 db.
- **COMPLETELY STABLE** C.W. on 144 mc. NO mechanical modulation. Pure D.C. note. No drift.
- **RUGGEDLY BUILT** — Suitable for mobile application.
- **USE WITH ANY COMMUNICATIONS RECEIVER** — Availability with output at I.F. frequencies 6-10 mc., 8-12 mc., 10-14 mc., 12-16 mc., 14-18 mc. We recommend use at I.F. output 14-18 mc.
- **COMPLETELY SHIELDED** — In beautifully finished silver gray hammertone steel case.
- Available (SPECIAL ORDER) for other CD or industrial frequencies. Also available for Collins receiver.
- **USES 6BZ7, 2 — 6CB6, 2 — 6J6 tubes. COMPLETE** with plugs, tubes and crystal. **\$42.50**
- Kit Form. Complete. **\$29.75**

Ask your dealer or write us

523 Winne Ave. River Edge P.O., N. J.

indicated the bunny was due east. Turning east, the bunny was located. He had been hiding between two buildings on a school ground.

The author calls this the "spiral" technique. It cuts down the possibility of passing the bunny without realizing it, a condition that might easily occur if the hunter tried to drive directly to the bunny.

Well, that's how it is done in Seattle, to say nothing of the coffee and rag-chew at the favorite beanery after the hunt. So, bundle the XYL and the junior ops in the family chariot and really have some fun.

## Mobile S.S.B. Receiver

(Continued from page 35)

The heaters are originally in series-parallel for 24-volt operation. They are easily rewired in parallel if the mounting screws holding the capacitors over each tube socket are removed and the capacitors carefully moved out of the way while making the necessary changes.

An additional stage of audio is necessary to obtain good speaker volume. A small sub-chassis was made from light-weight galvanized metal and soldered to two opposite capacitors, as shown in the photograph. A seven-pin miniature socket was mounted on this chassis to take the 6C4 audio tube.

The second detector was modified as shown in Fig. 2. The wiring for the a.v.c., a.n.l., and 6C4 audio stage is also shown here. The long leads going to the audio gain control should be shielded. Many of the components in Fig. 2 are already in the original set. Douglas R. Jordan's article, "New Life for the Q5-cr," *QST*, February, 1951, will be helpful to the builder.

After these modifications, the BC-453-A is a high-performance mobile receiver. I believe it to be the only unit, easily obtainable, qualified for s.s.b. mobile reception.

## THE NEW Master-Flex-'R

### RELIEVES THE SHOCK OF THE WHIP ON LOADING COILS

Here is a must for all mobile hams!... The new heavy-duty Master-Flex-'R, designed to relieve the stress and strain and prevent damage that could be transmitted to the loading coil. The Master-Flex-'R protects the whip and prevents the loading coil from injury and detuning while driving at high speed, or from overhanging limbs and driving into garage. Permits whip to be fastened down to car on bumper mount installations of late model cars. Made of sturdy spring steel, yet flexible enough to absorb all the shock. Heavy cadmium finish to withstand the elements. Takes only a few minutes to attach to the coil.

Amateur Net

**\$1.95**

### NEW!... Master "TENAHOOLD"

#### Stops Antenna Whipping

Screws on to rain molding of car. Protects antenna from long hanging limbs or driving into garage. Also when driving at high speeds. Hard cadmium plated finish.

## XMTRS FOR 160 TO 2 METERS or Special Freq. 500 KC. to 160 MC.

### LETTE MODEL 240 TRANSMITTER WITH MOBILE CONNECTIONS AND A.C. POWER SUPPLY

This outstanding transmitter has been acclaimed a great performer throughout the world. Air wound plug-in coils used for high efficiency. Takes any freq. from 1.6 to 30 mc. Ideal for General Class, Novice, C.A.P., C.D., Industrial. Sold direct from our factory, ready to operate. 40 to 50 watts input, Phone-CW. Complete with 8 x 14 x 8 cabinet, 40 meter coils, xtal, tubes: 6V6 osc., 807 final, 5U4G rect., 6SJ7 xtal mike amp., 6N7 phase inv., 2-61.6's PP mod. Wt. 30 lbs. \$79.95. 80, 20, 10 meter coils \$2.91 per band. 160 meter coils \$3.60.

#### MODEL 130 FOR 120 TO 130 WATTS — \$199.50

**MODEL 242 FOR 2 METERS — 45 WATTS INPUT —** 6146 FINAL. Complete with mobile connections, A.C. power supply, tubes, xtal. Xtal mike input. Uses 8 mc. xtals. Swinging link matches 52 — 300 ohm antennas. Same cab. as 240. \$89.95. Also 6 meter model.

**150 WATT ANT. TUNER** matches any antenna, 8 x 10 x 8 cab. \$20.00. Coils extra: 160 — \$4.30, 80 — \$3.45, 40 — \$2.73, 20 — \$2.40, 10 — \$2.31.

#### VFO FOR ANY OF ABOVE TRANSMITTERS — \$49.95

### LETTE RADIO MFG. CO.

62 Berkeley St.

Valley Stream, N. Y.

## S.W.R. Bridge

(Continued from page 31)

$C_1$  is also tuned for minimum or a null. It may be necessary to readjust both  $C_1$  and  $C_2$  to get the best possible null. The taps on  $L_2$  may have to be moved toward the center of the coil if a good null isn't obtained with the tap near the outside. However, though there may be more than one set of conditions that will give a good null, the best condition is with the taps as close to the ends as possible. When the best reading is obtained, the bridge can be removed from the coax line and the line connected directly to the transmitter. The transmitter can then be loaded to the proper operating input.

There are two points to be remembered. No matter what changes are made *at the transmitter*, they will have no effect on the match so long as the frequency is left the same as when matched. Point number two is that the controls,  $C_1$ ,  $C_2$ , and the taps, should *not* be changed after the system is matched. Again, this holds true for a given frequency. Any loading adjustments should be made at the transmitter, not the coupler.

With the system matched, it will probably be noticed that it is possible to vary the operating frequency, without retuning the antenna coupler, over a wider range than was possible before. The actual range will depend upon the antenna system. The settings of  $C_1$ ,  $C_2$ , and the taps can be noted for each particular point in the band and it then becomes a simple matter to change the controls to the correct setting whenever the operating frequency is changed.

### Coax-Fed Antennas

Another place the s.w.r. bridge does yeoman duty is in the case of a coax-fed beam, such as is used on the 20-, 15-, and 10-meter bands. Assuming that we are going to match a 15-meter beam fed with 72-ohm coax, the procedure is simple. The bridge is connected to the transmitter with a piece of 72-ohm coax and full-scale reading is obtained with the output side of the bridge disconnected. After full-scale reading is reached, the line to the antenna is connected to the bridge. The matching network at the antenna is then adjusted for the lowest possible reading on the milliammeter. When a reading of zero or close to it is obtained, one can be fairly sure that the antenna is acting as a 72-ohm load for the 72-ohm coax and the s.w.r. is very low. The bridge is removed from the line and the transmitter can be loaded up. You can then be pretty sure the r.f. is going to the antenna and not being used up as heat in the feed line.

If one is interested in making actual standing-wave-ratio measurements, the Measurements chapter of the *Handbook* describes an excellent bridge that can be used for this purpose. However, for making sure your antenna system is working properly, the unit described here is worth its weight in the 24-carat stuff.

## Hints & Kinks

(Continued from page 36)

nally employed in the voltage amplifier and the modulator require no modification when the 12AT7 is replaced with the Type 6U8. Component designations —  $C_{10}$ ,  $R_{10}$ , etc. — shown on the new schematic, refer to Fig. 1 of the article which appeared in 1952. — *Cal Hadlock, W1CTW*

## OUTBOARD VOLTAGE REGULATOR

MANY hams would like to have a source of regulated voltage for experimental use, but do not care to tie up a transformer and the necessary filter components in a supply that will be employed only at irregular intervals. The late W5LS designed an *outboard regulator* that may be used with any small power supply capable of delivering up to 100 ma. at 350 to 400 volts.

The circuit diagram of the regulator is shown in Fig. 3. Tests of the circuit, made with the output

Fig. 3 — Circuit diagram of the voltage regulator. All resistors, except  $R_1$ , 1-watt carbon.

$C_1$  — Optional ripple filter, 0.1  $\mu$ f., 600 volts.  
 $R_1$  — 10,000-ohm 3-watt wire-wound potentiometer (Clarostat Series 58).

control,  $R_1$ , adjusted for an output of 225 volts, showed no voltage drop at loads as high as 77 ma. When adjusted for an output of 250 volts, the regulation was constant up to loads of 60 ma. and a drop of no more than 5 volts was measured with the load increased to 77 ma. At 275 volts, the output remained steady with loads up to 54 ma. and fell to approximately 240 volts with the drain raised to 77 ma.

Variations in the design to meet special conditions are possible. In addition to the ripple filter shown, the connection of a 0.002- $\mu$ f. mica capacitor across the VR-75 will reduce the noise amplification, in which case the 20- $\mu$ f. capacitor can be eliminated. Of course, the filament voltage applied to the regulator tubes cannot be used for equipment powered by the regulator unit. — *E. P. Prass, W5AFL*

**Quick way** to read the color code on any ceramic capacitor or resistor!

**Use this handy Centralab Color Code Calculator**

Match the colors on this calculator with the colors on any ceramic capacitor or resistor coded in accordance with JAN or RETMA requirements. When you do, the information you're looking for shows up on the face of the calculator. There's temperature coefficient, capacity, and tolerance.

That's certainly easier and surer than relying on memory, isn't it? And it's faster than measuring by instrument.

Get your Centralab Color Code Calculator from your Centralab distributor now.

## Correspondence

(Continued from page 46)

signal, and seems to be conscious of the fact that they have to sell the thing in the proper light. A fellow with a bad signal finds out about it quickly. The vast majority of s.s.b. operators are convinced that with the proper operation of *existing* receiving equipment, not to mention the excellent supplementary units which improve the existing equipment, there is very little justification for the criticism that s.s.b. "hogs" the bands. As a group, and through experience, they feel that the opposite is true — and a close examination of the number of individual QSOs in, let's say, any range of 10 kc. in the top of the 75-meter band, should prove the point. Any reasonably good communications receiver, properly operated, can generally receive an a.m. signal much closer to a s.s.b. station than it could adjacent to another a.m. signal. Only experience can prove this, not opinions!

My most serious concern, however, is the nature of some of the severe criticism and remarks being made about the so-called deliberate interference, and also the attitudes of some of the a.m. operators that the s.s.b. boys are supposed to restrict their operation to a portion of the band and that the rest of the band is a.m. territory only. Admittedly, there are some rotten apples in the s.s.b. barrel, and some of the s.s.b. boys are not selling a thing but trouble, but as a whole, the group does not deserve the criticism that they are receiving by a minority group. It is my personal opinion that neither group owns any portion of the band, nor any particular frequencies therein. I believe that that is also recorded as a matter of law!

It is also my opinion that these remarks have progressed, or rather digressed, to the point where they are rapidly becoming a black eye to the ham fraternity in general. I believe it is meant that the ham bands can be used for free and intelligent discussion of these issues, but that they are not meant to be used by a minority group for the purpose of insulting the person, integrity, and character of anyone who does not believe as they, the minority, do. Furthermore, this group's only sensible argument to the issue is that they are not in the minority. They are, I am sure, in the majority in number, but most definitely in the minority in attitude. This group is, I believe, the product of the influence of a certain few individuals who are using the too-popular views. They contend that the FCC is "investigating the matter, so you s.s.b. boys better get the heck out of here." Personally, I would welcome an FCC investigation of the issue, and seeing in print what the results of such an investigation would disclose.

— Elton B. Miller, W5IKE

## VIEWPOINT

Aeronautical Center Amateur  
Radio Club  
Box 1082  
Oklahoma City 1, Okla.

Editor, *QST*:

As an amateur who built and operated "wireless" equipment long before the spark-tube hassle of the Twenties, I was amused at the rantings of W4WQT in his letter published in the December issue of *QST*.

While some of us have probably not done much to unite the amateurs, we are certainly not trying to divide them over the small issue of s.s.b. versus d.s.b. We feel that the caliber of remarks used in W4WQT's letter is entirely uncalled for and inexcusable and that *QST* has struck some kind of a new low in publishing it.

— C. E. Gardner, W5AGM  
President

Brantford, Ont.

Editor, *QST*:

I have just finished reading the letter from W4WQT concerning single sideband. I quite agree with him. This is the new era and sideband is the coming thing. But at this time, I wish to say live and let live. Surely there is adequate space for all of us, no matter what our mode of operation. The amateur clan are supposed to be gentlemen; let us live up to this and try to get along in peace and harmony.

— R. Crandell, VE3AOT

## with the amazing, new AMECO LOW PASS FILTER

The AMECO low pass filter suppresses the radiation of all spurious signals above 40 Mc. from the transmitter. The filter uses a Constant K Circuit, and is designed for Coaxial cable (52 to 72 ohms).

**OTHER FEATURES INCLUDE:**

- Negligible Insertion Loss
- 35 Db and more attenuation of harmonic and spurious frequencies above 50 Mc.
- Will handle up to 200 watts of RF power
- Each unit complete with bracket, and instructions

**At the amazingly LOW, LOW price of \$1.95 Amateur net**

## HIGH PASS FILTER

The AMECO high pass filter is placed in series with the TV receiver's antenna to prevent the transmitter's signal from entering the receiver. All frequencies above 45 Mc. are passed through without loss. The AMECO high pass filter is designed for use with the common 300 ohm twin line.

Model HP-45

**OTHER FEATURES INCLUDE:**

- 40 db and more attenuation of 14 Mc. and below; 20 db attenuation at 10 meters.
- Negligible insertion loss
- Filter uses balanced constant K circuit

**At the amazing low, low price of 89¢ Amateur Net**

## Happenings

(Continued from page 47)

### SECURITY RULES

*QST* has earlier reported (p. 46, August 1954) a proposal by FCC to amend our rules to exclude from eligibility for an amateur license any person who is a member of the Communist party, or Communist-front organization, or any group advocating the overthrow of the U. S. Government by force. Additionally it was proposed that only persons of good moral character would be eligible for amateur licenses; factors to be considered in this connection are former membership in above-mentioned organizations, and conviction of a felony. Because of the varied comments filed and "the legal questions which have been raised," FCC has designated the matter for oral argument to be held in Washington on March 7, 1955.

### NOVICE EXPANSION PROPOSED

In late January FCC issued a Notice of Proposed Rule Making to expand the 40-meter Novice segment to read 7150-7200 kc. This action is based on a request of the League formulated at the 1954 meeting of the Board of Directors. Date for filing comment is April 15, 1955.

Readers may recall that when in early 1952 the Commission proposed 7175-7200 kc. for Novices, the League heartily endorsed the idea but asked that the segment be a full 50 kc. FCC decided not to grant ARRL's request at that time, believing that it would be better to wait until some Novice operation there provided some experience on which to base judgment concerning a possibly larger band. As stated, in 1954 the League reiterated its request, which has now taken the form of proposed rule-making.

## World Above 50 Mc.

(Continued from page 56)

them first with a code oscillator, repeating the text on voice shortly after. This not only spreads the latest news of ARRL affairs, but also provides much-needed code practice for quite a few of the gang who do not get code experience in any other way.

W2TTU's summary in January *QST* (Fig. 5, page 13) and other long-term records show that auroral activity is not common in January, but two of the best aurora sessions in years came on consecutive nights, the 17th and 18th, of January, 1955. These did not follow the usual pattern as to time, either, both apparently getting under way around 2245 EST, and running for about two hours. This is about the time of night when auroras that have started earlier taper off. Activity in these was considerable, and reports of stations heard and worked have been received from as far east as W1BCN, out on the elbow of Cape Cod, and as far west as W7DYD and W7TMU in Washington, as well as from scores of stations in between.

For years the v.h.f. operators who take advantage of the fun and DX that only aurora sessions offer have been something of an exclusive club. You hear the same fellows in there every time. You also hear dozens of roaring completely unintelligible carriers of 'phone stations, some of them undoubtedly coming from fellows who would be amazed if they knew how far they were getting out at the time.

(Continued on page 146)

# Brand New!

Hot off the presses of Rand McNally comes this 1955 edition of the ARRL World Map. Loaded with changes that bring our "ham world" right up to the minute!

No active amateur can afford to be without one of these popular and useful adjuncts to good operating. Here is why the ARRL World Map is such a favorite:

As soon as you hear a DX station you can see exactly where he is—the country prefixes are not just listed in the marginal index; they're printed on the countries, themselves. You can tell his direction from you, and his distance. There's no question about which continent he's in—boundaries of the six continents are plainly marked.

The time zones are plainly marked, too. Call areas of thirteen countries are shown. Principal cities are designated. There's a scale of miles, another of kilometers. Printed on heavy map paper measuring 40" wide x 30" high, in 8 colors that really stand out, this new ARRL World Map is easily read from your operating position.

40" x 30" 8-Color Map, \$2.00, postpaid anywhere in the world

Requiring some use and knowledge of the code, aurora DX does not get the play it deserves. Perhaps some hesitate to jump in, fearing that their lack of skill in the handling of c.w. will show up glaringly. But nobody need worry on that score. Few v.h.f. men are c.w. operators of long experience, and many are just getting their first licks in. Even if you could send and receive at 40 w.p.m., there would be no point in doing it, as experience has shown that there is little to be gained in going much beyond 15 in auroral communication. If 15 w.p.m. sounds like high speed to you, don't let that stop you; there is no more coöperative group of hams anywhere than you'll find on 6 or 2 during an aurora session. They'll be glad to work you at any speed.

So why not fix up a system for keying your transmitter right now? Then you'll be ready to partake of one of the most interesting experiences ham radio has to offer, the next time the aurora lights the northern skies. Look through the top calls in W1, 2, 3, 4, 8, 9 and 0 in the 2-meter states-worked box. Almost without exception, they got there via the auroral route. There's no easier way to move up the ladder, and you'll get the thrill of your ham career when you join the aurora club!

**OES Notes**

W1UIZ, Salem, Conn. — Nightly skeds with W1WHC/1, Wellfleet, Mass., indicate that this 120-mile path can be covered regularly on 144 Mc. with readable voice signals. This is at 2130, and is followed at 2200 by a similar check with W1YQI, Marblehead, Mass. The latter circuit, about 100 miles, is also consistent. Planning gear for 1215 Mc.

W2ORA, Collingswood, N. J. — Round-table in Philadelphia area each Monday at 2030 is big help in keeping the 6-meter gang together. As many as 12 stations participate, and more are invited. Heavy antenna damage during fall hurricanes has now been largely repaired.

W3KLA, Baltimore, Md. — Equipment under construction: coaxial tank circuit for 4X150A, amplifier for 144 Mc., will also operate as doubler to 220. W3YQD now keeping nightly sked on 220 with W4UMF, Arlington, Va., at 2115.

W3OTC, Silver Spring, Md. — 50-Mc. activity holding up well during winter months, with good turnouts for Sunday-morning and Monday-night sessions. Extraordinary 50-Mc. reception during Sunday morning of V.H.F. SS. W1FZ, Farmington, N. H., answered CQ, but faded out before complete exchange could be made. W3OJU, Washington, D. C., also heard W1s briefly during same period. As no exceptional tropospheric signals were heard, this one period of 400-mile reception appears to have been an extra-long meteor burst, or some other form of short-duration reflection.

W3UQJ, York, Pa. — Would like to see QST box listing accomplishments of 220- and 420-Mc. stations, similar to 2-meter box. After several months of regular skeds on 220 Mc. with W4UMF, and contacts with Maryland, there now seems to be some probability of a Pennsylvania contact, as two 220-Mc. stations are being built by York-area hams.

W4HHK, Collierville, Tenn. — After more than a year of almost daily observation of meteor-burst signals on 144 Mc. there appears to be a lag of a day or so between the predicted peak of a meteor shower and the maximum results on the 2-meter schedules. Daily tests with W1HIDQ and W2UK continue, working schedules permitting.

W5FPB, Albuquerque, N. Mex. — Though there are about 40 hams in the area who can get on 144 Mc., few show up regularly on net. C.d. group would like 2-meter mobiles for their communications plan.

W6ZDO, Canoga Park, Calif. — Nightly transmission on 431.5 Mc., 2000 PST. Receiver for 1215 Mc. completed, and work started on transmitter.

W7JHX, Port Orchard, Wash. — Completed new a.f.c. system for 10,000-Mc. gear. Seems extremely stable, holding over wide frequency range.

W7JRG, Billings, Mont. — Gear for 432 Mc. about completed, including 4X150A coaxial-tank tripler, 16-element array with plane reflector, and crystal-controlled converter with two lighthouse-tube r.f. stages. Also working on balanced modulator for s.s.b., 3.9 to 50.4 Mc.

W7NVO, Boise, Idaho — Working on 145.44 Mc. in Boise Valley 2-meter net.

W9LEE, Westboro, Wisc. — New power supply completed; now running 600 watts on voice. Continuing 0745 skeds with W0B3N, but 2130 sked discontinued. OBS trans is sions nightly, except Monday and Friday, as follows: west — 1955; southeast — 2000. Frequency — 144.12 Mc.

## Facts About Learning Code

**TELEPLEX** is the method that teaches all phases of Code: Unlimited number of practice tapes contain actual sending of many different operators. **TELEPLEX** records your own sending and repeats it back to you. You **SEE** and **HEAR** your own signals. Perfect way to learn to use bug. Automatic CQ'ing. Perfect automatic transmission to put Code practice on the air. You can try it before you rent or buy it. Speed range 5 to 75 words. "Facts About Learning Code" is free and interesting. Write for it today. See it at **Bian's**, 64 Dey St., New York City

**TELEPLEX CO.** 415 G. St., **MODESTO, CALIF.**

## YL News & Views

(Continued from page 54)

meeting, W6JZA, Elsa, accepted the post of "Hospitality Chairman" for the YLRL Convention in June with K6ANG, Billie, assisting her. . . . The Christmas day issue of the *Troy Record* featured an article on K2IRF, Pamela Proctor, of Watervliet, N. Y. . . . Chairman of the *YL Harmonics* cover contest W2EEO, Madeline, and committee K2AMZ, Alda, W2NA1, Marge, and KN2J11Q, Barbara, announce as first-prize winner W2JZX, Vi, and second-prize winner VE3AJR, Dell. . . . W6ERR, Ann, is working out well with a new single-sideband Slicer, Christmas present from her OM. . . . W1AHS, Ruth, of Providence, R. I., was formerly active as W4BPF and Lucile, ex-W4KZT, is now KP4ZV. . . . New harmonies were recently born to W4UTO, Mary Ann, WN4HML, Rosie, and W8KLZ, Betty. . . . YLRL chairman of the Fourth District, W4RLG, reports three new YLs in Alabama: K4BGH, Judy, Silverhill; KN4AFZ, Marie, Birmingham; and KN4APF, Ann, Adger. Frances also tells us that W4TVO, Lorraine, is manager of the Virginia 'Phone Net; W4WJX, Dean, is president of the Birmingham ARC, and W4WTJ, Betty, is treasurer of the Mid-South ARA. . . . W4DEE, Beulah, and W4YJD, Chris, invite interested YLs to join them on s.s.b. each Tuesday at 2:30 EST, 14,292 kc. . . . W1VXC, June, is the new PAM for Rhode Island. . . . W4UMI, Eleanor, is home after spending several months in a hospital. . . . W3s GYU HUX MBI SPV participated in the January V.H.F. Party on 2 meters. . . . The daughter of W8FPT, Wava, is now WNSUVV, Jeannie. . . . W1YPT, Louise, is Secy.-Treas. of the Cape Cod and Island Net on 75' phone. . . . W1VOS, Marge, has her first endorsement for her YLCC certificate. . . . Using her OM's call W6MBD, W6QOG, Helene, now has 160 countries worked on 'phone. . . . W6WSV, Carol, gives the results of the recent officer's election of the San Francisco YLRC: W6QMO, Pres.; W6PCN, Secy.-Treas.; KN6GDC, KN6HIW, Board of Governors. . . . W6QMO, Jeri, made BPL again in December.

W8GJX, Helen Cloutier, gives credence to the conclusion drawn many times that a busy YL always finds time to do still more. Last November, Helen became the first YL to receive membership in the Quarter Century Wireless Assn., thus honoring her 25 years of amateur activity. From a start with a 15-watt Hartley rig and a Silver-Marshall receiver, W8GJX has progressed to a 400-watt TVI-suppressed transmitter and assorted fixed-station and mobile gear. Besides being an active operator, Helen is the mother of sons W8QFD and W8UED, a "variegated hobbyist," and a career woman. Author of several books, including *Sim Barton, Girl Radio Operator* (story of a young girl's determination to achieve success as a First Class ship's radio operator), Helen is pictured at the console of station WESK, NBC, Escanaba, Mich., where she is continuity director and supervisor of women's activities. W8GJX maintains that her many amateur experiences have directly stimulated her other pursuits and interests.

# SINGLE SIDEBAND

HERE'S the latest addition to the ARRL library of publications tailored especially to the needs of amateur radio. Single sideband operation is here to stay and it behooves us all to learn about this modern and revolutionary form of transmission. Whether or not you're already using SSB, you'll find much useful information on both transmitting and receiving techniques in "Single Sideband for the Radio Amateur." The work of more than twenty-five authors is collected between two covers for convenient reference. Keep up with the game, get your copy now!

# Balun Coils

## ANTENNA MATCHING COIL

Have you wondered where you could secure the Balun coils referred to in the December, 1953 issue of QST and in the ARRL handbook? If so, you probably have a need for a matching transformer to couple the 300 ohm line from your antenna to the 75 ohm input on your converter. Or does your present setup involve lengths of Co-ax to satisfy this requirement? Or even worse, are you just guessing and, as a result, losing that weak signal in the mismatch? A proper match will insure the best operation from your converter, and thus those weak DX openings can be turned into QSL cards rather than a station you were unable to identify. Whether you operate on 50, 144, or 220 Mc you can be sure of a uniform match over these bands without any tuned circuits.

Two of these small coils less than 2" long and 1/4" in diameter will clean up your shack by replacing feet of Co-ax with a small 4 to 1 impedance matching transformer. Wound on threaded ceramic form.

## Net Know-How

(Continued from page 63)

phrase and mentally repeat it two or three times before going on to the next phrase. Of course, if the receiving station is using a typewriter you can speak more rapidly. A number of voice operators have learned through experience how to prolong certain syllables and add certain "nieeties" to make the words more intelligible. Proper enunciation of numbers is vital since they occur so frequently in texts of emergency traffic as well as in addresses and telephone numbers. Recommended phonetic substitutes used *only* when required can be of tremendous value.

### Stick to Business

During net operations all communications should be limited to the serious business at hand; rag chewing and nonpertinent discussions should be eliminated. All transmissions must be aimed toward moving the traffic on to its destination.

The pamphlet "Operating an Amateur Radio Station," published by the ARRL, is required reading for every active ham. It's available on request and without charge to League members and to others for twenty-five cents. The chapters on Emergency Communications, Message Handling and Network Organization are especially pertinent to the present subject.

In conclusion:

LISTENING and a silent transmitter are often more important and more helpful than transmitting.

TRAINING and familiarity with standard procedures are basic requirements for helpful participation.

NET DISCIPLINE and compliance with orders from the established net control station are essential to best success of the amateur effort.

ACCURACY and exactness in both transmission and transcription of messages is more important than speed for speed's sake.

PARTICIPATION in an emergency net imposes responsibilities beyond reporting in with an offer to help and then leaving the net at will.

## MEASURE STANDING WAVE RATIOS !

Providing an accurate measurement of standing wave ratios, the Johnson S. W. R. Bridge insures the most effective use of a low pass filter and antenna coupler for efficient power transfer and ultimate TVI suppression. 52 ohms impedance, can be changed to 70 ohms or other desired value. Equipped with SO-239 connectors and polarized meter jacks.

**TENNALAB • Quincy, Illinois**

**FEED-BACK**

In Turner, "A Steerable Array for 7 and 14 Mc." in the February issue, Fig. 1 should show  $L_1$ ,  $L_2$  and  $L_3$  as 7 turns instead of 8.

— . . . —

The splatter filter chart appearing as Fig. 3, page 19, December *QST*, in the article "120 Watts of Audio Without Driving Power," was incorrectly drawn. The accompanying version is the proper one.

Although values taken from the chart in December *QST* will not be theoretically correct, it is doubtful whether a design based on them will show a material improvement in actual performance if the values are corrected to conform with the accompanying chart. This is because there is wide latitude in the selection of a frequency in the first place, and because it is difficult to obtain the exact values of inductance and capacitance called for in the ideal case. In other words, use the chart herewith if you're starting out fresh, but don't worry about the performance of a filter already built from the December data.

— . . . —

In an editor's note in the correspondence column on page 138 of the January issue, reference was made to the ARRL Safety Code. The code was published in the issue for June, 1953, not 1952 as stated.

— . . . —

Re the circuit diagram of W6RET's crystal-controlled converter on page 34 of the December issue, the positive 175-volt supply should be connected at  $C_3$ , rather than  $C_7$ , so that the voltage to the 6J6 will be reduced.

# HAM-ADS

(1) Advertising shall pertain to radio and shall be of nature of interest to radio amateurs or experimenters in their pursuit of the art.

(2) No display of any character will be accepted, nor can any special typographical arrangement, such as all or part capital letters be used which would tend to make one advertisement stand out from the others. No Box Reply Service can be maintained in these columns.

(3) The Ham-Ad rate is 30¢ per word, except as noted in paragraph (6) below.

(4) Remittance in full must accompany copy. No cash or contract discount or agency commission will be allowed.

(5) Closing date for Ham-Ads is the 20th of the second month preceding publication date.

(6) A special rate of 7¢ per word will apply to advertising which, in our judgment, is obviously non-commercial in nature, and is placed and signed by a member of the American Radio Relay League. Thus, advertising of bona fide surplus equipment owned, used and for sale by an individual or apparatus offered for exchange or advertising inquiring for special equipment, if by a member of the American Radio Relay League take the 7¢ rate. An attempt to deal in apparatus in quantity for profit, even if by an individual, is commercial and all advertising by him takes the 30¢ rate. Provisions of paragraphs (1) (2) and (5), apply to all advertising in this column regardless of which rate may apply.

(7) Because error is more easily avoided, it is requested that name and address be printed plainly. Typewritten copy preferred.

(8) No advertiser may use more than 100 words in any one issue nor more than one ad in one issue.

*Having made no investigation of the advertisers in the classified columns, the publishers of QST are unable to vouch for their integrity or for the grade or character of the products or services advertised.*

WANTED: QST's 1920 and earlier. Top cash prices paid. A. F. Suenen, 3600 Forbes St., Pittsburgh 13, Penna.

SELL: AN/ARC-13 Driver, modulation transformer, pair of 811s, \$17; T-21/ARC-5, new \$10; Plate transformer 3600 volts, center-tapped, 450 Ma.; \$30; new pair RCA 832A's, \$15; tubes, capacitors, etc. Send for list. Seidman, W2GZN, 1535 Longfellow Ave., Bronx, N. Y.

FOR Sale: Complete mobile rig. Elmac rcvr and xmtrr, pwr supplies, etc. 33% off cost. Write for details. Box 206, Roxbury, N. Y.

GLOBE-KING, 400 watt pk; 450 c.w. Bud VFO, coils for all bands, extra pair TZ40s; BC342 rcvr, complete, \$395. F.o.b. Martinsville, Va., Webb, W4AAH, 103 Erwin St., Villa Hgts, Martinsville, Va.

SELLING: Transmitting equipment with gray Bud panels; heavy duty power supply, 750 volts, 300 Ma. plus bias, \$50; 500-watt antenna tuner, \$25; new parts for 350-watt final amplifier and variable voltage filament power supply, 106 for photos and details plus list of mobile gear, test equipment, tubes and parts. Gray Bud cabinet, CR-1772, \$35. Roy Gillett, W2PNG, 68 Hyde Boulevard, Ballston Spa, N. Y.

SOUTHEASTERN Hams! For a good deal in ham gear try Curle Radio Supply, 404 Meridan, Huntsville, Alabama, 439 Broad Street, Chattanooga, Tennessee.

SELL: R23/ARC 5, Q5'er unmodified, new w/dynamotor, \$20; BC348Q coil assemblies, new, RF #191, Det. #192, \$3 ea; PE101C, new, modified #3395; DM32A, \$14 each; BC605 coil set, \$2.50; QST's 1937-1948, \$2 per yr. all plus shipping. Have cash for good receiver. M. J. Marshall, 455 Washington Ave., Dumont, N. J.

SELL: 450TH tubes, \$17.50 each, or two for \$30. Complete power supply 1000 VDC at 500 Ma. or 2000 VDC at 300 Ma., plus filament and relay voltages, \$48. Beautiful Federal commercial radio telephone transmitter, full kilowatt plus. In three slim six-ft. cabinets, power supply, modulator and RF units, uses 450TH modulator and output tubes. Original cost about \$7000. Asking \$595 or trade for 450TH A3, All F.o.b. W7DI, Cheyenne, Wyoming. Box 2098, Cheyenne, Wyoming. Call B. Hempel, W7DI.

FOR Sale: SX28A relay rack style receiver, less speaker. First check cash, or money order for \$90 (takes 10 Will pack and ship. W8FSA, c/o Itasca Radio Sales & Service, Itasca, Michigan.

GOING Mobile or High Frequency? A complete Gonset outfit for sale for cash. Deluxe two meter Communicator II (squelch), Super-Six Converter, Super-Ceiver, Gonset Commander transmitter and V.F.O. All in a "like-new" condition. Take one, take all. W1KJT, R. T. Graham, P.O. Box 23, Stoneham, Mass. Tel. ST 6-1966.

HISTORICI! "The Story of the First Trans-Atlantic Short Wave Message" is illustrated with photographs, diagrams, reproductions of logs, news stories, magazine articles. Send \$1 to The Radio Club of America, 11 West 42nd St., New York City 36 and ask for the 1BCG Issue of the Proceedings.

LOS ANGELES Hams! For sale: 1 K.W. linear amplifier, AM, FM, SSB, etc., only \$100. Only \$1000 10 watts drive. \$600. Terms. Mr. W. P. Quinn, Dunkirk 3-5054.

FOR Sale: Lyisco 600 transmitter, with 401 modulator, 9W2, 1250 volt 300 Ma. power supply, \$20. Want: NC100 with PW dial. J. Phipps, W2CQP, Box 1004, Sparta, N. J. Lake Mohawk 8203.

WANTED: Plate transformer for FRC-1 3600V CT, 200 Ma. Sell BC221AC with chart, excellent; SCR522, complete, brand new, never used. Best offer. W6FDG, Clark, 40 Ardmore Road, Berkeley 7, Calif.

WANTED: Good National, Collins, Hammarlund or Hallcrafters receiver, Matchbox, W6KDR, Stidham, 904 N. Dickel, Anaheim, Calif.

MUST sell complete mobile and fixed station including Gon-Set Iriband, Hallcrafters SX24, two transmitters, power supplies, etc. Write for complete list of equipment and prices. Albert E. Linden, W3KY1, 306 Dogwood Drive, Levittown, Penna.

SSB20A, never used: \$210. Howard Dunlap, Box E, Beverly Farms, Mass.

VIKING II, like new, factory-wired: \$265. W2CFT, Box 483, Lake Ronkonkoma, L. I., N. Y.

RECORDISTS! Exchange talking and musical tapes internationally! Box 1404-B, San Francisco 1, Calif.

SELL: Heathkit AR-2 com. revr, gud condx, with cabinet; prefer local sale: \$25. Jerry, K2HNF, 579-84 St., Brooklyn, N. Y.

HY-LITE 3-el. 15 over 20 meter beam. Original carton. Never used. Small prop pitch motor completely converted, transformer, 2 selsyns, \$125. Original cost, \$163. Niagara low pass filter, \$5. Plate filament transformers, double-single button carbon microphones, tubes, relays, crystals, meters. Write for list. W2EQS, O'Brien, 48 Prospect Ave., Westwood, N. J.

SELL: B & W Baldurs (for 32V and Viking). New Dow-Key coax relay. Melvin Gardner 134 S. Ferry, Ottumwa, Iowa.

SELL: New BC654A xmtrr/rcvr with all tubes, PE104 power pack T17 mike, key, no conversions, \$50, with PE103, \$65, complete portable diathermy, good operating condx, \$25. Oliver F. Nash, 134 Ashman Circle, Midland, Michigan.

SELL: NC173 and speaker, in excellent condx, \$110; Harvey-Wells TBS50 DeLux, with companion power supply, and VFO, in like-new condx, \$140. Harvey-Wells dynamotor 6V input 350V, 250 Ma. output. New, never used. Best cash offer. Ed Edwards, 7067 No. Ashland Blvd., Chicago 26, Ill. Ho. 5-7198.

SELL modern TVI-proofed 65-watt transmitter, 25 watt modulator, power supplies, antenna coils, etc. Constructed as per February 1952 QST. First \$100 takes all. Send for details. Don Franzmann, W9NFJ, 647 Ripley Ave., Eau Claire, Wis.

SELL: Viking II, Viking VFO, Matchbox, Hallcrafters SX-88 with speaker, B&W low pass, D 104 mike Vibroplex Bug, Heathkit grid dipper, Miller Bridge, Baluns, Relays, 500 watt coils, antennas, coax, etc. Beautiful condition and functionally perfect. All sincere offers or inquiries welcomed and acknowledged. Gordon Crowe, W0JPG, 303 Brush Creek, Kansas City, Mo. Phone L 0gan 2426.

SELL: QST January 1928 thru December 1954, in excellent condition. \$75.00. Fred Conr, Neoga, Ill.

FOR Sale: Elmac PMR-6A mobile receiver; also PMR-6 and PMR-116 power supply. David Lauer, 1317 Blaine Blvd., Racine, Wis.

SELL/Swap: One complete mobile station. Elmac AF67 xmtrr, Morrow 5BR converter with S/W Mobile-Ceiver modified with outboard FNS, 8 ft. whip with Johnson whip-load 6 coil, extra strong base and heavy coil spring. Carter Gen-E-Motor 500w, at 200 Ma.; Leece-Neville AC generator with mountings for Ford 6, complete, chest mike, bug, all instruction books; Triplet 3256 absorption freq. meter. Cost over \$500. Want \$250 cash or excellent SP400 Super Pro or Collins 75A1. Andy Sallet, P.O. Box 103 Seward, Ill. F.o.b. Seward, Illinois

SELL: Fifty lesson CREI radio course, \$50 or trade for rcvr or xmtrr. Warren Jarvis, W4SCY 139-28 230th Place, Laurelton, N. Y.

SELL: High-voltage dc generator 1060 volts, 425 amps: \$15. W4OFP, SX-71 Like-new condx, used 50 hours: \$175.00. Harold Greene, W1KO, West Hanover, Mass.

MEDICAL Hams! Trade Raytheon portable microtherm in new condx; want 75A3 in same condx. C. R. Faulkner, K4AXE, 106 No. Main, Somerset, Ky.

FOR Sale: XYL needs room! Collins 310B, all coils, like new. TVI suppressed, \$200; BC459, new, \$24.95; BC455, new, \$16.95; Mobile Equipment: TBS50 Sr. \$75; Gonset Triband Converter, \$30; BD77 generator with 6V relay, \$25; complete Master Mobile ant. with 20 meter coil and 6 volt co-ax antenna changeover relay, \$15 Or \$125 for all mobile equipment. Many other items! Send for list! Mike Rosenberg, W2FNF, 35 Strawberry Lane, Roslyn Heights, L. I., N. Y.

COLLINS 32V1, in excellent condx, \$350. National HFS and pwr supply, \$90. Prices F.o.b. Glenside, Pa. Krewson, W3OQI, P.O. Box 175, Glenside, Pa.

QSTs: 280 issues — 1922-1950, \$100, with covers. Stamp for list. Bud Gentry, W6WIM, 428 Maple, Richardson, Texas.

FOR Sale: AR-88-D rcvr with manuals, best offer, new BC625A 1000 watt tubes, in carton, \$17.50; two Miller R-9ers each with two coils, \$18.00 each; Miller high voltage power supply type 90281 with manual, \$75 or best offer. All replies answered. All F.o.b. Ipswich, Mass. Write to W1TKC, P.O. Box 232, Ipswich, Mass.

COLLINS 32V3 xmtrr, like new, \$590; National NC-183 rcvr with spkr, in gud condx, \$175; Instructograph with 11 tapes, less oscillator, \$20; PE103 dynamotor, like new, with spare brushes, \$25. Don DeShazo, Jr., W9BVC, 529 Blackstone Ave., LaGrange, Ill.

ALUMINUM reflecting callsign. Regular, \$1.50; Jumbo, \$2.00, lawn stake sign, \$2.50. Day service. Whitley, W2LPG, 133 Airdale Ave., Long Branch, N. J.

BC-342 receiver, A-1 condition, \$90. W1CEG, 183 Daly Ave., New Britain, Conn.

SELL: Collins kilowatt modulation transformer, conservatively rated, \$40, W6WZD.

SELL: Viking II and VFO, like new, factory-wired, \$325 or best offer. Reason for selling: Going SSB! W0TGC, Muholand, 1656 Liggett Ct., St. Louis 19, Mo.

SELL: Collins 32V1, \$375; HRO-60R, \$425; Collins 30-1 with 310-C exciter, \$475; Bechm, automatic key with 3-4 tape perforator for Morse code, \$145; TS-34, \$145; Dumont #241, \$275; APN-9 with inverter, \$225; 1-208 sig. gen., \$150; Want: BC-610, ARN-7, ARC-1, TS-173, TS-174, TS-175, BC-614, Collins 75A, 32V, Tech. manuals and supply catalogs. Tom Howard, W1AFN, 46 Mt. Vernon St., Boston 8, Mass. Tel. Richmond 2-0916.

FOR Sale: 1 new 2C43 tube, 2 new 2C39A tubes, 1 used 5G 60-cycle selsyn. Best offer to Genaille, W5RSN, 2122 E. Monroe Ave., Harlingen, Texas.

PASS amateur theory exams. Check yourself with sample FCC-type questions and Novice and General Class examinations. All for only \$04. Ameco Electronics, 1203 Bryant Ave., New York 59, N. Y.

FOR Sale: Modified Hy-Lite 20-meter beam; 3-elements; spaced .15 director, 2 reflector, "Y" match, 50 pounds. Will crate and ship collect. Photographs on request. K2IXC, Fairchild, 23 Woodridge Lane, Sea Cliff, N. Y.

COMING Soon! 75-watt 160-10 handswitching CW transmitter. Kit: \$59.95, Wired: \$69.95, 25-watt kit, \$19.95. Details free. Hart Industries, 467 Park, Birmingham, Mich.

SELL: Collins 32V3, \$575. Cash and carry. W4KNW, 742 So. 78th St., Birmingham, Ala.

MOBILE transmitter 80-40 M. xtal with Carter dynamotor, 400v. at 300 Ma. ATR inverter RSB input 6v. output 110 AC; 85 w. intermittent, \$12.00 F.O.B. San Antonio 9, Texas. Johnston, Box 6703.

ANTENNA Wire #18 high strength Copperweld 1000 ft., \$4.60; 2500 ft., \$9.75 postage paid. R. J. Buchan Co., P.O. Box 9, Bricelyn, Minn.

SELL: Elmac AF-67, 600 volt pwr supply, PMR 6-A w/pwr supply, Shure 505-C mike, Advance Elec. coax relay, speaker, all brackets, cables, manuals, etc. Excellent condx; \$285. Allan Murphey, W4JAG, Princeton, Kentucky.

A Stancord 10-meter xmitter, 3Br narrow conv., Western Electric dyn., 5.8 v. in 425 v. 375 Ma. outp. All for \$75.00. Jeff Taylor, W9BRH, 714 N. Lockwood Ave., Chi. 44, Ill.

WANT Tape-Recorder, Write for list of gear offered in trade. VESMS, LaFleche, Sask., Can.

FOR Sale: Hallicrafters SX-71 with matching speaker, in gud condx; \$140. W4ESD, 29 Morton St., Aiken, S. C.

FOR Sale: Eldico Universal antenna coupler; shielded cabinet for TBS-50; Wanted: G.D.O.; frequency meter; Pr. 4-250A; Pr. 810, power supply capable of output 2500 v. @ 400 Ma. W9PWW, 83 W. Waukegan Rd., Lake Forest, Ill.

SELL: NC-200 receiver, \$100 f.o.b. Reason: drafted. W4UKO, 1001 Sedgefield Rd., Charlotte, N. C.

COLLINS 32V-3 with spare 4D32, in original carton, with manual. Spotless and guaranteed like new. Used very little. First check for \$595 takes it. Herb Green, W9ARI, 1227 West 17th St., Muncie, Ind.

FOR Sale: BC-610 transmitter. Factory converted for ten meters. Like new condx. New modulation transformer all new plastic condensers in speech equipment. Complete with BC614 speech amplifier, technical manuals and cables and ant. relay. Spare modulation deck spare 250TH and 100TH, \$450. Francis L. Sutton, 1018 Club Drive, Johnstown, Penna.

SELL IRE Proceedings 1950 through 1954 with directories, \$15 per year. ARCA, 825 E. 6th St., Ft. Lauderdale, Fla., W4CGS, 3102 SW 15th Ct., Ft. Lauderdale, Fla.

FOR Sale or trade: LS-84, CG-301, CG-104, PA-429, PA-109, all UTC. Rack mounted amplifier, 6V6's into LS-52, push-pull. Freed, 13600. Two 203A plus sockets. Will trade for good stamps. All replies answered. A. R. Ronzio, 1250 41st St., Los Alamos, N. Mexico.

LYSCO Model 600 transmitter, in gud condx, \$75. Roy Scherman, W9FHS, 4640 No. Kasson Ave., Chicago 30, Ill.

NOW! Power your surplus recvrs and transmitters from 115VAC line "Tabtron" B28V/5A for AKC5, BC312, 342, 348 at \$15; "Tabtron" B28V/24A for BC634 or BC375 at \$110; "Tabtron" B12V/50A for BC191 at \$110. "TAB", 111 Liberty St., N. Y. 6, N. Y.

HALLICRAFTERS HT20 AM-CW transmitter, used less than five hours. Prefer pickup here. Will sacrifice at \$300. Also Thordarson 11M77 multimatch 300 watt xmitter, \$20. W9GXB, Mitchell Wiseman, 5157 Clarendon Rd., Indianapolis, Ind. BR 9429.

OLDE Rex: Please call, write or wire Olde Rex first for an excellent proposition in all new and used ham gear, National HiFi, and Winchester portable lighting and generating equipment. Consulting and installation specialist amateur mobile equipment featuring Harvey-Wells (T-90 and R-9) and Elmac (PMR6A and AF-67 gear). Visitors welcome evenings and weekends to Electronic Heights, Home of New England's only 6-element 20-meter Telrex. Olde Rex, Electronic Heights, 5 Retrop Road, Natick, Mass. Tel. Olympic 3-2130.

SALE: Hammarlund HQ-140 X receiver. New condition: \$230. Henry H. Harris, Jr. P.O. Box 1187, Charlottesville, Va.

CLEANING House: Power supply parts, transmitting variable condensers, miscellaneous amateur transmitting and receiving parts and tubes. Stamp for list. W8CBS, 743 Erie Avenue, Chillicothe, Ohio.

SELL: ART-13 Sp. amp. new w/tubes, \$15. Motorola dual Vibrator sup. 340v., 240 Ma., \$15; Master Mobile Mount 132XC, \$7; Master Mobile Ant. with 75 and 20 M coils, \$5; converter 75 M, \$10; Auto xfrmr 110V. 600 Va., \$6; dynamotor 5.8V, 425V, 375 Ma., \$10. Carbon mike taxicab type retractable cord, \$5; dynamotor start relays same as in PE1013 6V, \$1.50 postpaid. Write for details. A. Brocato, 1334 Brown Marx Bldg., Birmingham, Ala.

RECEIVER wanted with xtal filter, noise-limiter, and S meter: \$100 maximum. P. H. Silbert, 44 Seaview Ave., Marblehead, Mass.

MO Hams or others, if between age twenty and thirty-two, high school graduate, some typing ability, copy code twenty WPM, and interested in permanent position in police communications write: Director, Radio Division, Missouri Highway Patrol, Jefferson City, Missouri.

QST: Need February 1920. Pay your price. Also govt. call books 1923-25 and Wm. B. Duck catalog. W5NW, Box 586, Odessa, Texas.

2-METER Beams; 6 element, horizontal or vertical, all seamless aluminum. \$6.95 prepaid. Wholesale Supply Co., Lunenburg, Mass.

SELL VHF transmitter using Millen 90810 RF unit, 1625s Class B modulators with S-9 driver, three power supplies, in 30-in. relay rack. Photos available, several spare 829Bs, three AX3 crystals, coils for 2, 6 and 10. BC-634A with PE-104, various Command transmitters and receivers. Dismantling 500 watt AM transmitter, all parts for sale. Send for list. W9GWL.

FOR Sale: Gonset 2-meter converter, \$28; McMurdo-Silver 2-meter xmitter including crystal, \$30; both in brand new condx; RCA 45 RPM with ampl. in portable case, new crystal, \$18. Wanted: National One Ten, also Gonset Communicator. H. I. Griffiths, W2OQR, 39-82 65 Place, Woodside 77, L. I., N. Y.

FOR Sale: BC610-E transmitter de-TV'd, with 614-E speech amplifier, 2 spare 250THs, 4 spare 100THs, coax antenna relay, all for \$550 F.O.B. Denton, Texas. Will deliver within 100 miles. Also SX-43 receiver with R24 speaker, both \$99.50. Call or write W5CC, H. V. Shepard, phone Central 4144. Write P. O. Box 669, Denton, Texas.

SELL: R-4/ARR-2 receiver, 11-tube, UHF for operation on 1 1/4 meter band. With tubes, schematic, less dyn., \$7.95 MD-7 Modulator, provides plate and screen mod. for any xmitter of the AN/ARR-5 equipment. With 4 tubes. In excellent condx; \$7.95; MP-28 modulator only for power supply, TA-12 xmitter. In new condx, with dynamotor, \$14.95. ID6A/APN4 indicator 'scope, in gud condx. With 27 tubes, xtal and schematic, \$19.95. C. J. Casey, 7460 Varna Ave., N. Hollywood, Calif.

A concise, clearly written text for use with the Radio Amateur's Handbook, A Course in Radio Fundamentals is ideal for the beginner but just as useful for the more advanced amateur who wants to brush up on his radio knowledge. For radio theory classes it is one of the most practical books available.

Complete with study assignments, experiments and examination questions based on the Radio Amateur's Handbook.

"You get more fun out of radio if you know how and why it works"

90801

## The No. 90801

## EXCITER-TRANSMITTER

The No. 90801 Exciter-Transmitter is of the most modern design including features and shielding for TVI reduction, band-switching for the 4-7-14-21 and 28 megacycle bands, circuit metering. Conservatively rated for use either as a transmitter or exciter. 5763 oscillator-buffer-multiplier and 6146 power amplifier. 90 watts input for CW. Can be keyed in the oscillator and/or amplifier or by means of keyed external V.F.O. such as the 90711. 67 watts input phone. Rack mounted 3½" panel height.

# How to select a tube for single sideband

To realize the advantages of Single Sideband operation, there are two important points to keep in mind when selecting a final amplifier tube. First, since there is no continuously running carrier, high peak powers may be reached when a signal is put on the air. And second, because it is easier to produce an SSB signal at a low power level, it takes more than an ordinary tube to build this valuable low power signal from the modulator to high power in a single amplifier stage. Eimac tubes offer these extras. Their reserve supply of filament emission, lack of internal insulators and widely recognized ability to handle high peak power has been proved over the years. And high power gain is inherent in all Eimac multi-grid tubes. When planning or building an SSB rig, remember these two important points and consider the Big Six of Amateur Radio—Eimac 4-65A, 4-125A, 4-250A, 4-400A and 4X150A radial-beam power tetrodes and the 4E27A radial-beam power pentode.

## EIMAC BIG SIX RADIAL-BEAM POWER TUBES CLASS AB<sub>1</sub> LINEAR AMPLIFIER SERVICE

### Typical Two Tone Performance\*

	DC Plate Voltage	DC Screen Voltage	Peak Sig RF Grid Driving Voltage	Peak Sig Plate Power Input
4-65A	2000	450	100	195
4-125A	2500	555	100	300
4-250A	3000	600	110	630

## always refer to the most widely used AMATEUR & INDUSTRIAL BUYING GUIDE

### USE ALLIED'S 1955 CATALOG for Everything in Electronics

You'll want to keep your 308-Page ALLIED Catalog handy always—not only to fill all your station needs, but to provide you promptly with *everything* in electronic supplies—at lowest, prevailing prices. Your ALLIED Catalog lists the largest and latest selections of receivers, transmitters, electron tubes, electronic parts, Hi-Fi audio equipment, recorders, radio-TV components and industrial electronic equipment. Save time, effort and money—fill *all* your electronic supply needs from your 1955 ALLIED Catalog. If you don't have it—write for **FREE** copy.

we're always trading

**high at ALLIED**

Why wait for that new receiver? Select any new model (we stock them all) and get the top trade-in on your old equipment. Enjoy easiest terms, too—only 10% down, or your trade-in as down payment. So why wait? Just describe your equipment, tell us what you want to buy, and we'll reply promptly with the best deal anywhere. Write us today.

## the difference is often an **HRO** *Sixty*

Try a side by side comparison between the HRO-Sixty and the best receiver of any other make. Tune both to a hard-to-read signal. You'll discover that an HRO-Sixty often means the difference between an R5 and an R3! For sensitivity and low noise level, the HRO-Sixty stands alone!

**COVERAGE:** 50-430 kc., 480 kc.—35 mc. And 50-54 mc. Voice, CW, NFM (with adaptor).

**FEATURES:** Edge-lighted, direct frequency-reading scale with one range in view at a time. 3 I.F. stages at 456 kcs. employing 12 permeability-tuned circuits on all bands plus one I.F. stage at 2010 kcs. on all frequencies above 7 mcs. Switching is done automatically when coil set is plugged in. Built-in, isolated heavy-duty power supply. Sensitivity of 1 uv. or better at 6 db. sig./noise. Selectivity variable from 3 kc. overall to app. 100 cps. at 6 db. Current-regulated high frequency oscillator and first converter heaters. Voltage-regulated high frequency oscillator and S-meter amplifier. Negligible drift after warmup. Micrometer dial for logging. Provision for built-in crystal calibrator unit. Variable ant. trimmer. Accurate S-meter. Min. tubes in front end and high freq. osc. Osc. circuits do not drift during standby. High-fidelity push-pull audio ( $\pm 2$  db. 50-15,000 cps.) with phono jack. BFO switch separated from BFO freq. control. Illumination dimmer control. Accessory socket for Select-O-Ject.

*tuned to tomorrow*

## RAD RIGHT ANGLE DRIVE

A sturdy right angle drive with die cast zinc housing and gears. Ideal for ganging condensers or potentiometers or other parts in hard-to-reach locations on the chassis. Smooth, quiet, positive, with no backlash.

# Leading Amateur Designs

## ...USE RCA TUBES

### Beam Power RCA-6146

90 watts ICAS input on CW; 67.5 watts on 'phone. Full input to 60 Mc. Reduced input up to 175 Mc. For example, it handles 48 watts input on 2-meter 'phone.

For example, look at the final amplifier of Johnson's Viking II. Two RCA-6146 beam power tubes in parallel deliver a signal wallop that is making history in the amateur bands.

Here's why this well-known power type is so popular: RCA-6146 delivers full power at relatively low plate voltage. RCA-6146 has high power sensitivity (a 6AQ5 doubler/buffer drives it). RCA-6146 operates with high efficiency — on all bands of this transmitter.

Preferred by radio amateurs—and by commercial transmitter designers—RCA high-perveance beam power tubes and triodes are available in a wide choice of input ratings. Your RCA Tube Distributor handles the entire line. For tube technical data, write RCA, Commercial Engineering, Section C37M Harrison, New Jersey.

Close-up view of the RCA-6146's in parallel — in the final amplifier of the Johnson Viking II.

OUR MILLIONTH FILTER SHIPPED THIS YEAR...

# FILTERS

## FOR EVERY APPLICATION

### TELEMETERING FILTERS

UTC manufactures a wide variety of band pass filters for multi-channel telemetering. Illustrated are a group of filters supplied for 400 cycle to 40 KC service. Miniaturized units have been made for many applications. For example a group of 4 cubic inch units which provide 50 channels between 4 KC and 100 KC

Dimensions:  
(4682A) 1½ x 2 x 4".

Dimensions:  
(3834) 1¼ x 1¾ x 2-3/16".  
(2000, 1) 1¼ x 1¾ x 1¾".

### AIRCRAFT FILTERS

UTC has produced the bulk of filters used in aircraft equipment for over a decade. The curve at the left is that of a miniaturized (1020 cycles) range filter providing high attenuation between voice and range frequencies.

Curves at the right are that of our miniaturized 90 and 150 cycle filters for glide path systems.

### CARRIER FILTERS

A wide variety of carrier filters are available for specific applications. This type of tone channel filter can be supplied in a varied range of band widths and attenuations. The curves shown are typical units.

Dimensions:  
(7364 series) 1½ x 1¾ x 2¼".  
(9649) 1½ x 2 x 4"

### DISCRIMINATORS

These high Q discriminators provide exceptional amplification and linearity. Typical characteristics available are illustrated by the low and higher frequency curves shown.

Dimensions:  
(6173) 1-1/16 x 1¾ x 3".  
(6174A) 1 x 1¼ x 2¼".

For full data on stock UTC transformers, reactors, filters, and high Q coils, write for Catalog A.

## All G-E Tubes get individual tests to assure maximum dependability!

**Q**UANTITY-CONTROL sampling isn't enough—though G-E standards for this lead the industry. *Every* General Electric tube is checked for important operating characteristics.

Instrument dials say if the tube plate current is correct . . . if transconductance equals the prescribed value . . . if no undesirable reverse current flows in the grid . . . if there is no tube short, open circuit, or vacuum leak.

G-E tubes that pass these individual tests, must run the gauntlet of quality-control checks for over-all satisfactory performance. Are microphonics at a minimum? Does life-testing leave tube characteristics unchanged? Only if the

answers to these and many other questions are "yes" can G-E tubes be cartoned and shipped.

The tubes your G-E tube distributor sells are the best that precision manufacture, rigid inspection, and thorough testing can produce. Install them with confidence! *General Electric Co., Tube Department, Schenectady 5, New York.*

★ ★ ★

General Electric congratulates the winner of the 1954 Edison Award, Benjamin S. Hamilton, W6VFT, La Mesa, California. The judges named Mr. Hamilton as the amateur whose achievement was most noteworthy, because he provided San Diego County, California, with "an outstanding Civil Defense and disaster-emergency radio network". Recognition given to Award-winner W6VFT and to others whom the judges cited, was equally a tribute to the public-spirited efforts of radio amateurs everywhere.

**GENERAL**  **ELECTRIC**

## *Collins* for **NEW EASE in OPERATION**

75A-4 Receiver

The new Collins 75A-4 Receiver, 32W-1 Exciter, and the KWS-1 Kilowatt Transmitter are expressly designed for SSB, AM and CW. Like all Collins Amateur equipment, they meet the same high standards as Military and Commercial equipment.

The 75A-4 Receiver features passband tuning, AVC on SSB, bridged T rejection notch filter, built-in crystal calibrator circuit, separate detectors for AM and SSB, a new noise limiter, and provision for three Mechanical Filters together with time-proven features such as good image rejection, and an accurate linear dial with calibration of 1 kc per division.

Transmitter features include a SSB generator using Collins Mechanical Filters, selectable sideband, band switching from 3.5 to 30 mc, voice control or push-to-talk, automatic load control, and dual conversion with crystal controlled high-frequency oscillator and stable, linear, permeability-tuned low frequency oscillator resulting in a linear dial similar to the 75A-4 Receivers.

Power input is one kw peak envelope power on SSB, one kw on CW, and equivalent to one kw AM when received on narrow-bandwidth receiver.

Several versions of the transmitting equipment are available. The 32W-1 Exciter is capable of driving a kw linear amplifier. With exception of the power supply, which is housed in a separate cabinet, it is complete in a receiver-type cabinet and can be converted into a KWS-1. The KWS-1 is also complete in a receiver-type cabinet except for power supplies, which are mounted in an attractive desk-high cabinet. As an alternate, the KWS-1 is available without the high voltage power supply as type number KWS-1K, and kits are available for converting a 32W-1 or a KWS-1K into a KWS-1.

### AMATEUR NET PRICES ARE AS FOLLOWS:

32W-1 Exciter complete	\$ 895.00
KWS-1 Transmitter complete	\$1,995.00
KWS-1K Transmitter less H.V. power supply and P.A. tubes	\$1,225.00
428A-2 H.V. Power supply kit for KWS-1K	\$ 545.00
428A-1 Power supply for KWS-1K, wired and tested	\$ 700.00
367A-2 P.A. Kit to convert 32W-1 to KWS-1K	\$ 215.00

KWS-1 Transmitter

Chicago 24, Illinois

In Canada:

THE HALLCRAFTERS COMPANY • Don Mills Road • Box 27, Station R • Toronto 17, Ontario, Canada

## HALLCRAFTERS

- Covers Broadcast 538-1580 kc plus three S/W 1720 kc—34 Mc.
- Precision gear drive dial system.
- Double conversion with selectable crystal controlled second oscillators
- Selectable side band reception of both suppressed carrier and full carrier transmissions.
- Highly selective 50 kc I. F. system.
- CW operation with AVC on.
- Delayed AVC.
- Calibrated bandspread—"S" meter—double superhet.
- 10 tubes, 1 rectifier and voltage regulator.

# There's a PR for every Service!

## AMATEUR

### 40, 80 and 160 Meters, PR Type Z-2

Rugged. Low drift, fundamental oscillators. High activity and power output. Stands up under maximum crystal currents. Stable, long-lasting, permanently sealed.....\$2.95 Net

### 20 Meters, PR Type Z-3

Harmonic oscillator. Low drift. High activity. Can be keyed in most circuits. Stable as fundamental oscillators. Fine for doubling to 10 and 11 meters or "straight through" 20 meter operation.....\$3.95 Net

## COMMERCIAL

### COMMERCIAL, PR Type Z-1

Designed for rigors of all types of commercial service. Calibrated .005 per cent of specified frequency. Weight less than 3/4 ounce. Sealed against moisture and contamination. Meets FCC requirements for all types of service.

## SPECIAL TYPES

### Type Z-1, AIRCRAFT

3023.5 Kc., .005%.....\$3.95 Net

## Section Communications Managers of the ARRL Communications Department

**Reports Invited.** All amateurs, especially League members, are invited to report station activities on the first of each month (for preceding month) direct to the SCM, the administrative ARRL official elected by members in each Section. Radio club reports are also desired by SCMs for inclusion in QST. **ARRL Field Organization station appointments** are available in the areas shown to qualified League members. These include ORS, OES, OPS, OO and OBS. SCMs also desire applications for SEC, EC, RM and PAM where vacancies exist. *All amateurs* in the United States and Canada are invited to join the Amateur Radio Emergency Corps (ask for Form 7).

# THE AMERICAN RADIO RELAY LEAGUE, INC.,

is a noncommercial association of radio amateurs, bonded for the promotion of interest in amateur radio communication and experimentation, for the relaying of messages by radio, for the advancement of the radio art and of the public welfare, for the representation of the radio amateur in legislative matters, and for the maintenance of fraternalism and a high standard of conduct.

It is an incorporated association without capital stock, chartered under the laws of Connecticut. Its affairs are governed by a Board of Directors, elected every two years by the general membership. The officers are elected or appointed by the Directors. The League is noncommercial and no one commercially engaged in the manufacture, sale or rental of radio apparatus is eligible to membership on its board.

"Of, by and for the amateur," it numbers within its ranks practically every worth-while amateur in the nation and has a history of glorious achievement as the standard-bearer in amateur affairs.

Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification; ownership of a transmitting station and knowledge of the code are not prerequisite, although full voting membership is granted only to licensed amateurs.

All general correspondence should be addressed to the administrative headquarters at West Hartford, Connecticut.

## Past Presidents

HIRAM PERCY MAXIM, W1AW, 1914-1936  
EUGENE C. WOODRUFF, W8CMP, 1936-1940  
GEORGE W. BAILEY, W2KH, 1940-1952

## Officers

President . . . . . GOODWIN L. DOSLAND, W0TSN  
Moorhead, Minnesota .  
First Vice-President . . . . . WAYLAND M. GROVES, W5NW  
P.O. Box 586, Odessa, Texas  
Vice-President . . . . . FRANCIS E. HANDY, W1BDI  
38 La Salle Road, West Hartford, Connecticut  
Vice-President . . . . . PERCY C. NOBLE, W1BVR  
37 Broad St., Westfield, Massachusetts  
Secretary . . . . . A. L. BUDLONG, W1BUD  
38 La Salle Road, West Hartford, Connecticut  
Treasurer . . . . . DAVID H. HOUGHTON

# "It Seems to Us..."

## MOBILE SIGNING

The receipt of several inquiries on the subject prompts us to discuss some aspects of signing procedures when operating mobile in aircraft or on board ship. Apparently many amateurs assume that *any* station aboard an aircraft is "aeronautical mobile," and any station aboard a vessel is "maritime mobile." Not so, at least as far as amateur call sign identification procedures are concerned.

When operating in one of the ten FCC districts — that is, within the continental limits of the United States — an amateur mobile station in an aircraft or on board ship signs its call in precisely the same manner as any other amateur mobile station such as one in an automobile. For example, a station in an aircraft flying over Wisconsin would sign, on c.w., "de W3XXX 9." On 'phone, it would identify itself as "This is W3XXX mobile over Madison, Wisconsin." An amateur station aboard a boat in New York Harbor would sign ", 2" or "mobile in New York Harbor."

Only amateur stations operating outside the continental limits of the United States use the terms "aeronautical mobile" and "maritime mobile" as part of the required call sign identification. It follows that such terms should be encountered only in the 21- and 28-Mc. bands, such being the maximum permitted U. S. amateurs outside our country. Example: An amateur station on an aircraft en route to Europe would sign, on c.w., "de W3XXX AM." At the end of the contact, it would also indicate the number of the aircraft and the approximate geographical location, e.g., "de W3XXX AM NC41752 3000 MI E OF NEW YORK NY." On board ship on the high seas, the c.w. sign would be "de W3XXX MM," or at the end of the contact: "de W3XXX MM SS FLYING GULL 40 W 45 N." On 'phone, the same data would be conveyed in the signature.

The point of all this is, however, that amateur mobile stations within the continental limits of the U. S. sign in exactly the same manner whether they are being operated from an automobile, aircraft, a small boat, ocean liner, or a bicycle.

## BEST SELLERS

Even in these days of billions and trillions, a little ol' million is still a pretty substantial figure. It is especially so when one is speaking not of Government moneys, but of publication sales. And it becomes a strikingly large figure when it represents the sale of a pamphlet in a field as comparatively limited as amateur radio.

Yet *The Radio Amateur's License Manual* has just sold its millionth copy. *How to Become a Radio Amateur* has topped the half-million mark, and *Learning the Radiotelegraph Code* — the third and newest in the "Gateway to Amateur Radio" series ARRL has available for newcomers — is almost to the quarter-million mark. *The ARRL Antenna Book* is well over a quarter-million; *A Course in Radio Fundamentals* is pushing 200,000 with *Hints & Kinks* not far behind. Any way you look at it, these League publications have earned the title of "best sellers."

Time was when *QST* was the only League publication. In 1926, the first *Handbook* appeared; as its sales now approach the 3,000,000 mark we can laugh at our concern — although it was a deadly serious problem at the time — whether the initial printing of 5,000 copies could ever be sold before the text became obsolete!

But that's another story. In late 1929 the League decided, as one means to increase its membership, to promote interest in amateur radio on the part of potential newcomers. So Hq. got up a little pamphlet briefly outlining what amateur radio had to offer as a hobby, giving constructional details on a 160-meter two-tube (201As) regenerative detector and one-stage audio receiver and a UX 210 t.n.t. transmitter of about thirty watts, and some brief dope on how to learn the code and get licenses. It was given the title *How to Become a Radio Amateur* and thus — just twenty-five years ago — became the first ARRL booklet. Intended strictly as a promotional piece, it was nominally priced at a dime, which went mostly for postage and handling. Distributed through newsstands and from advertising in

Normally pretty cheerful guys anyway, General Manager A. L. Budlong and Circulation Manager David H. Houghton have good reason for these wide grins — the millionth copy of ARRL's *License Manual*.

boys' and home mechanic magazines, it enjoyed an immediate success.

So much so, in fact, that a couple of years later a new edition was brought out with somewhat more elaborate treatment. At about the same time, in response to a growing demand, the League produced a 20-page compilation of licensing information and some questions-and-answers for the amateur exam — which of course became the *License Manual*. A *QST* editorial of the date (1933) announced their appearances this way:

In addition to *QST* and the *Handbook* the League has produced this year a couple of booklets which we believe will be found most instructive and valuable. We intend before the year is out to produce a few more in a series which is now getting sufficiently extensive to be called a "Radio Amateur's Library." One of the important functions of ARRL is to make absolutely-reliable information available to its members at nominal cost. In preparing these booklets it will be our policy to select subjects upon which further light is badly needed, to give them complete treatment to an extent impossible in the pages of *QST* or the *Handbook*, and to sell them at nominal prices.

How could we put it any better today?

## OUR COVER

Yes — they're different! Here are the symbols that will appear in *QST* starting with this issue. The objective is to standardize, modernize, and simplify circuit symbolization. The American Standard symbols shown required five years of preparation. Those participating in this task included representatives of industry, government, and publishing.

For a detailed explanation, turn to "Graphical Symbols for Radio Diagrams," by Harold P. Westman, Technical Editor of *QST* in the late Twenties. The article begins on page 16.

## Strays

W9DYZ reports considerable interest in the formation of an association by electronic reps who are hams. He plans to have the first meeting at the Conrad Hilton during the May Parts Show and all "Hamreps" are invited to attend. For details write to John A. Benz, W9DYZ, 4809 West Fond du Lac Ave., Milwaukee 16, Wisconsin.

W9ARH recently received a QSL from W5BAQ. Nothing unusual except that the card was for a QSO held 23½ years ago!

The fog surrounding the origin of the variable bandwidth filter system described by Cmdr. H. E. Thomas, W6CAB, in February *QST*, page 17, has been lifted. Dana Griffin, W2AOE — who incidentally has authored a considerable number of thought-provoking articles in *QST* over the years — holds a patent (No. 2,354,749, issued August 1, 1944) on the system and described it publicly in a paper presented before the Radio Club of America in 1946.

An article entitled "An Amazing New Hobby: Ham Radio for the Whole Family" appeared in the February issue of *Parents'* magazine. The author, Walker A. Tompkins, K6ATX, presents a lively description of amateur radio and also some good hints for prospective hams.

An advantage of the screen protective circuit not mentioned in "A Protective Circuit for Transmitting Tetrodes," by Beling (*QST* for October '54, beginning on page 33) is that in the event of an open heater in the dual triode, the current path through the screen voltage dropping section would be open, thereby protecting the r.f. amplifier tube. — WSELJ

## ROANOKE ELECTION RESULT

Theodore P. Mathewson, W4FJ, has been elected Vice-Director of the Roanoke Division, receiving 522 votes to 434 for Thomas H. Wood, W4ANK, in the special election tallied on February 21st. Licensed since 1921, OM Mathewson is a past President of the Richmond Amateur Radio Club, an OO, and a member of the A-1 Operator Club. He is a life insurance underwriter in Richmond, Virginia.

## FLASH!

The Federal Communications Commission has acted to open the 50-Mc. band to Technician Class licensees effective April 12th. In the same action the Commission decided against opening the 144-Mc. band to Technicians.

# The All-Electronic "Ultimatic" Keyer

## Part I — Construction and Handling

BY JOHN KAYE,\* W6SRV

THE SELECTION two years ago of "Ultimatic" as a name for "a key with a memory" was a bit premature.<sup>1</sup> Reversion to the hoary twin-lever key and the addition of sequence "seizure" now eliminates most of the back-and-forth motion normally associated with code transmission, carrying the principle much closer to the ultimate.

The new sequencing function provides leeway for key release corresponding to, and greatly exceeding in time, the leeway for key closure provided by advance storage in the memory circuits. It also reduces the maximum back-and-forth motion of the hand to *once per letter*, and that at a greatly reduced rate. On most letters the rocking motion is completely eliminated. By obviating the fight against the hand's inertia, the effort expended for any given speed is greatly reduced. Besides relieving the operator of virtually all timing responsibilities, and most of the labor, the compound leeway does away with all sensation of being chained to an inexorable time base.

The time base, memory, and interlocked-sequencer circuits handle automatic spacing and advance storage of marking characters in a manner functionally identical to the relay model. (The original article is recommended rereading in conjunction with a detailed study of this improved model.) With twin keys and the new seizure circuitry, continuous closure of one key generates that type of character until the opposite key is also closed. After completion of the character in progress, the output switches to the opposite type, even with both keys closed. Release of either key provides output corresponding to the still-closed key. With one key held closed, a single opposite-type character can be injected by a closure (as short as 2 microseconds) of the opposite key at any time after the start of a desired preceding character.

Multiple intermediary opposite-type characters within a letter are obtained by holding one key closed throughout the entire letter while operating the opposing key long enough in the middle of the letter to get the desired string. When both keys are released together, the terminal character(s) is determined by the lastly-closed key. When the keys are released independently, the terminal character(s) is selected by the still-closed key.

### Using the Key

One can, of course, attack the keyer as if it were an ordinary bug or start-stop automatic key, or with any intermediate technique up to that realizing full usage of all functions. Since a given key need not be released to permit selection of an opposite-type character, the motions on the keys may be as careless as the mood dictates, with all kinds of overlap. The *one and only* requirement is that the two keys be closed in the proper order for the letter being sent. The output comes up straight and perfect.

A few specific examples of full sequencer usage are in order; otherwise an operator might never discover the really easy way to make a CQ, a numeral or, for that matter, any of the combinations. For the call "WIAW," both keys may be *squeezed* together four times, each time allowing the dot side to close at least a few microseconds before the dash side. They are both held at least until the last dash of each letter starts, and they are necessarily released between letters only long enough to establish automatic interletter spacing. "W6BJ" calls for similar technique, with the dash key making first contact on the "6" and the "B."

A question mark results most easily from continuous closure of the dot key for the entire duration, with the dash key operated any time during the second dot. The dash key is released anywhere from the start of the second dash up to due time for the first terminal dot. The reverse procedure gives a comma. A numeral such as "3" is made by holding dots throughout

Here is an all-electronic version of the "key with a memory," the "Ultimatic." Several improvements over the multiple-relay version have been incorporated in this newer version.

\* 2296 West Nicolet, Banning, Calif.

<sup>1</sup> Kaye, "The 'Ultimatic'—a Key with a Memory," *QST*, February, 1953.

the number, closing up the dash side any time after the third dot starts. Both keys may be released together any time after the beginning of the second dash, or independently.

That barecat "CQ" is a pushover: continuous closure of the dash key throughout each letter, with the dots flicked in indiscriminately, taking full advantage of the memory leeway. The "C"

can be started with the "squeeze" technique, or it can be made with two quick squeezes just long enough to trip the memories. This is true for *any* combination whose first two characters are of opposite type. In context, a given letter will normally be manipulated differently between different preceding and following combinations, to minimize seesaw motion. All code combinations

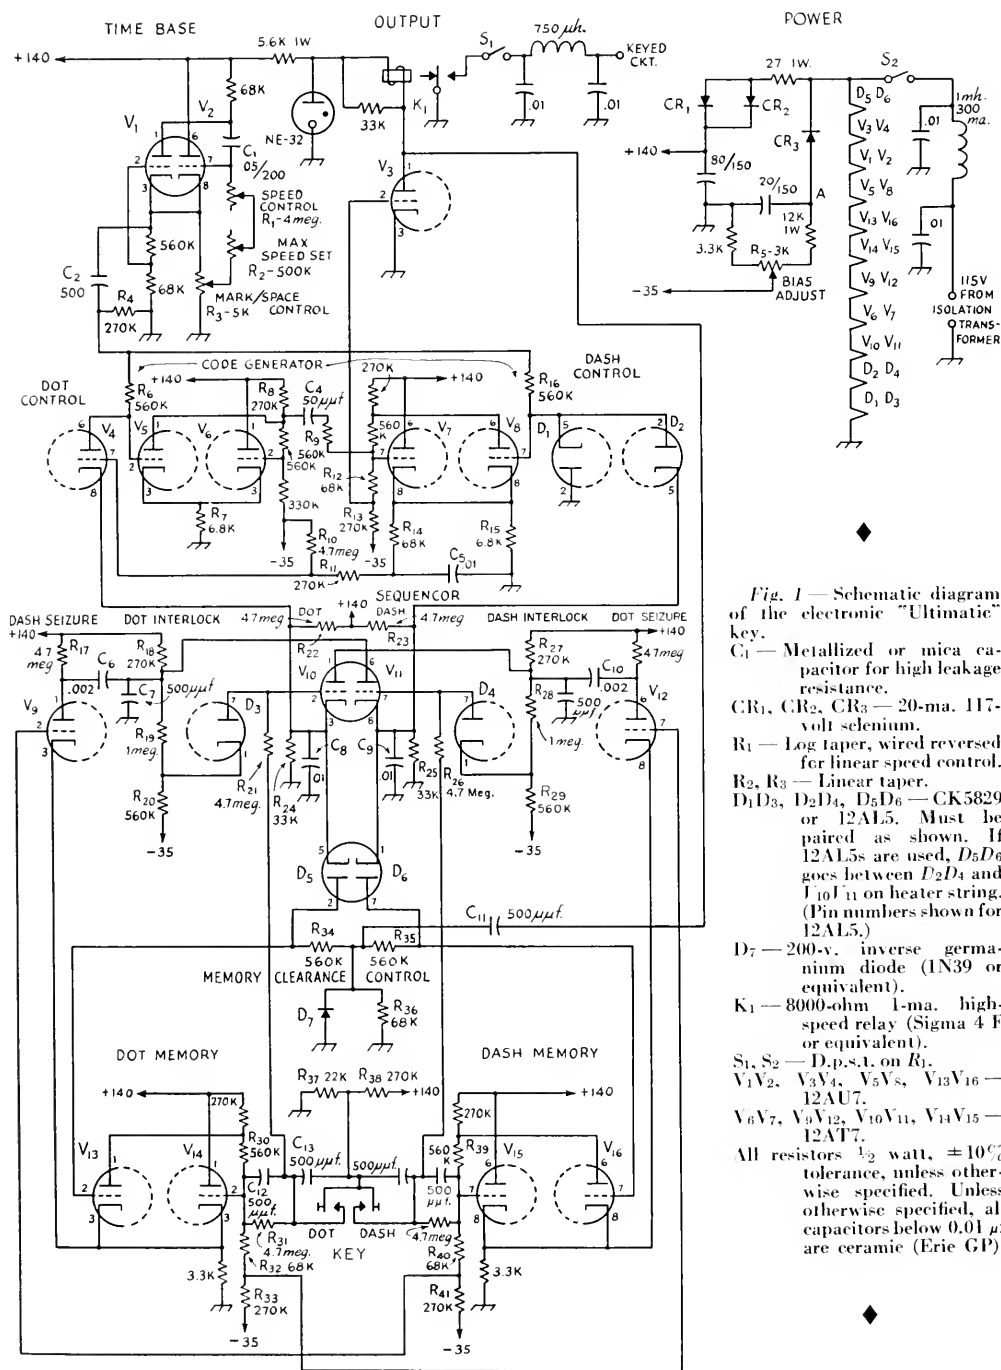

Fig. 1—Schematic diagram of the electronic "Ultimate" key.

C<sub>1</sub>—Metallized or mica capacitor for high leakage resistance.

CR<sub>1</sub>, CR<sub>2</sub>, CR<sub>3</sub>—20-ma. 117-volt selenium.

R<sub>1</sub>—Log taper, wired reversed for linear speed control.

R<sub>2</sub>, R<sub>3</sub>—Linear taper.

D<sub>1</sub>D<sub>3</sub>, D<sub>2</sub>D<sub>4</sub>, D<sub>5</sub>D<sub>6</sub>—CK5829 or 12AL5. Must be paired as shown. If 12AL5s are used, D<sub>5</sub>D<sub>6</sub> goes between P<sub>2</sub>D<sub>4</sub> and I<sub>10</sub>I<sub>11</sub> on heater string. (Pin numbers shown for 12AL5.)

D<sub>7</sub>—200-v. inverse germanium diode (1N39 or equivalent).

K<sub>1</sub>—8000-ohm 1-ma. high-speed relay (Sigma 4 F or equivalent).

S<sub>1</sub>, S<sub>2</sub>—D.p.s.t. on R<sub>1</sub>. V<sub>1</sub>V<sub>2</sub>, V<sub>3</sub>V<sub>4</sub>, V<sub>5</sub>V<sub>8</sub>, V<sub>13</sub>V<sub>16</sub>—12AU7.

V<sub>6</sub>V<sub>7</sub>, V<sub>9</sub>V<sub>12</sub>, V<sub>10</sub>V<sub>11</sub>, V<sub>14</sub>V<sub>15</sub>—12AT7.

All resistors  $\frac{1}{2}$  watt,  $\pm 10\%$  tolerance, unless otherwise specified. Unless otherwise specified, all capacitors below 0.01  $\mu$ f are ceramic (Erie GP).

other than those made up of straight series of like characters (I, S, H, 5, M, O) follow one of these illustrations in full or part, or they can be made by any intermediate motion down to that used on a Vibroplex. And with perfect results, regardless of fumbling!

### General Circuit Data

As the circuit diagram <sup>2</sup> in Fig. 1 shows, power is derived from line-type rectifiers. The tube heaters are in series across the line. Alternatively, the heaters can be fed in parallel or series-parallel from a suitable transformer. The plate and bias voltages are obtained from a 117-volt 40-ma. winding, or they can be borrowed from an available source via VR tubes. The NE-32 maintains constant relay current for stable mark-to-space ratio at all line voltages. An isolation transformer is, of course, mandatory unless the station is designed for "hot-line" operation throughout, through the use of appropriate safety grounding.

For long tube life, maximum plate current in most tubes runs around  $3\frac{1}{2}$  ma., although some tubes draw less than  $\frac{1}{2}$  ma. The pulse peak in  $V_2$  hits 6 ma. The keyer is completely stable with line voltages from 80 to 135, but it goes berserk if too much r.f. gets back to it through external leads. Voltages mentioned for various points in the circuit, as measured with a v.t.v.m., obtain with average tubes and 10-per-cent-tolerance components at 113 line volts and -33 volts bias.

### Construction

This particular unit was built in a Channel-Lock box cut down to 4 by 4 by 3 inches. The mounting plate fastened to the front panel section provides  $\frac{7}{8}$  inch below for components and  $2\frac{1}{16}$  inches above for tubes. All surfaces except the front are perforated with  $\frac{1}{8}$ -inch ventilation holes on  $\frac{1}{4}$ -inch centers, with additional  $\frac{5}{16}$ -inch access holes in the bottom for  $R_3$  and  $R_5$ .

To minimize bulk, the CK-5829 subminiature diodes and the NE-32 are wired direct without sockets. If 12AL5s are substituted for the expensive subminiature diodes, with relay output, the housing depth requirement is  $4\frac{3}{4}$  inches for another row of tubes. With electronic output instead of the relay, the two additional potentiometers can be stacked above  $R_3$  and  $R_5$ , with top-side access, and the NE-32 can be eliminated. It is entirely feasible, of course, to provide room for three 12AL5s by reducing the size of the keys. Subminiature potentiometers would then occupy the space below the chassis vacated by the CK5829s.

Further reduction of over-all size is not recommended. The thing already runs hotter than the proverbial two-buck pistol, with the present amount of compression. On the contrary, one should really spread it out in a big box or rack mounting, bringing out the key and

• Two years ago, W6SRY described his "key with a memory," which made it possible to send perfect code without perfect manipulation by the operator. The one stumbling block for some constructors was the multiplicity of relays used in the circuit. We are pleased to present the all-electronic version, which not only eliminates the need for critical relays, but makes for still greater handling ease by the operator.

The length of the article requires that it be published in two parts. We depart from custom in presenting the circuit and constructional details before the circuit explanation, to better serve the many amateurs who have written to the author requesting details on this key. Part II (next month) will explain how the circuits work and how the output relay can be eliminated.

speed-control leads in separate shielded and p-section r.f.-filtered pairs. Speed-control lead r.f. by-pass capacitors should not exceed 0.001  $\mu$ f. each side of 750- $\mu$ h. r.f. chokes. The key-lead r.f.

Fig. 2 — (A) Top view of a suggested tube-socket and control arrangement for the Ultimate key. Arrows point in direction of pin gap. (B) Details of the key-lever construction. The screws are 8-32.

<sup>2</sup> Copies of the enlarged schematic diagram are available for 50 cents from ARRL's Technical Information Service, 38 La Salle Road, West Hartford, Conn.

by-pass capacitors should make up the total 500  $\mu\text{f.}$  of  $C_{13}$  and its corresponding capacitor on the dash side.

Fig. 2A and a photograph show the top view of a socket orientation providing optimum component dress, with resistors mounted on and between the sockets. All No. 9 pins and center shields were removed to provide more room for parts. With the heaters connected in parallel for 6.3-volt operation, the No. 9 pins should be bent over and soldered to the mounting rings. If the series heater connection is used, the heater leads should be dressed very tightly against the chassis, to minimize a.c. fields.

Fig. 2B shows a side view of the key levers. Although a cone pivot bearing is definitely superior, the threaded bearing pivots in this unit proved surprisingly good, and they can be readily built with a minimum of effort. The keys are assembled on a  $1\frac{1}{2} \times 2 \times 1\frac{1}{16}$ -inch metal plate, insulated from the chassis by  $\frac{3}{8}$ -inch Plexiglas levers and threaded on the 8-32 pivot bolts. (Metal pivot blocks, tapped for 8-32, are bolted to the  $\frac{3}{8}$ -inch Plexiglas.) The pivot bolts are secured to the key plate with nuts, as shown. The "spring" tension is adjusted by sliding the rubber band to an appropriate position. This method of supplying spring tension absorbs most of the sloppiness that might result from too loose a thread fit in the pivot screws, a condition apt to arise from filing threads to eliminate binding.

During construction of the many miniaturized models preceding this one, it was found wise to wire subcircuit by subcircuit, performance checking each subcircuit before going on. Nothing is so exasperating as finding a bonehead error buried under three layers of resistors massed together with  $\frac{1}{8}$ -inch leads. Ask me — I know!

### Trigger & Bias Adjustment

The sole adjustment procedure consists of running the bias up and down at  $R_5$  with various line voltages between 80 and 135, to find the range of stable operation for each functional circuit. At each test setting, check over-all operation and each circuit individually with a v.t.v.m., in accordance with the functional summaries.<sup>3</sup> Observation of circuit performance can be greatly simplified by slowing things down to a walk with 0.25  $\mu\text{f.}$  (metallized, to minimize leakage) shunted across  $C_1$  of Fig. 1, so that the v.t.v.m. needle stands still long enough to be read. Approximate expected voltages are given in the circuit description. Others are readily calculated from the divider strings, bearing in mind grid-loading effects. With normal-tolerance components, it is to be anticipated that one or two of the subcircuits may turn up with a bias range centering somewhat off the median value. The addition of a 2- to 4-megohm shunt across the appropriate element of the resistance string will pull the range center to median. The final setting of  $R_5$  is at the average of the bias-range midpoints for all the subcircuits at expected nominal line voltage.

Tube and component aging is compensated at  $R_5$ , though readjustment will not be required until prolonged aging has drastically shifted the tolerance midpoints. The model shown here tolerates a  $\pm 5$ -volt bias shift from the  $-33$ -volt median established at a nominal 113 line volts.

### Mark-Space Adjustment

With 0.004- to 0.01-inch relay armature travel and continuous 15-w.p.m. dots,  $R_3$  is set for half-scale reading of an ohmmeter connected across

<sup>3</sup> Given in Part II.

This top view shows why the author does not recommend building the key into a small volume.

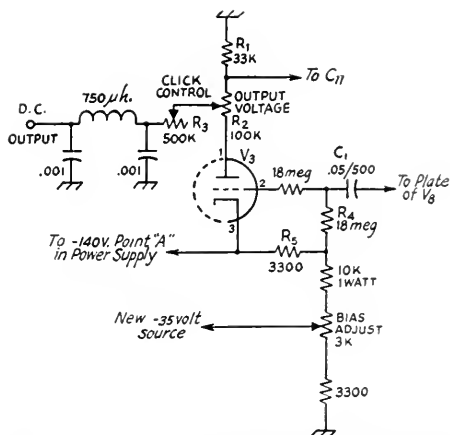

Fig. 3 — Optional output circuit for the Ultimatic. If this circuit is used, the heaters of  $V_3V_4$  must be moved to the ground end of the heater string in Fig. 1.  $C_1$  — Metallized capacitor.

the output terminals. Then at the desired maximum dot speed the relay spring tension is adjusted for midscale on the ohmmeter. Steady dashes should read one-quarter scale. The two adjustments interact a bit, so two or three runs may be necessary to establish a constant mark/space at all speeds. Since  $R_3$  affects the top speed,  $R_2$  is set last, with  $R_1$  at minimum, for the desired top speed.

With electronic output,  $R_1$  of Fig. 3 is set, on spacing output, for slightly more than cut-off for the vacuum-tube keyer to be used.  $R_3$  of Fig. 1 is then set, on 30-w.p.m. dots, for the desired mark/space ratio as indicated by final-amplifier plate current.  $R_2$  of Fig. 1 is trimmed for the top speed.

### Test Equipment

It must be remembered that the *only* test equipment that can possibly be used to read many of the voltages in the Ultimatic is a v.t.v.m. with an input impedance on the order of 30 to 50 megohms, or an equivalent cathode-fol-

lower device. Even with a 1-megohm isolating resistor in the probe, the triggers will sometimes be tripped by capacity as contact is made. To determine which way a circuit is stabilized, it is best to read across the cathode resistor, touching the grid-plate strings only for an actual voltage.

### Learning To Use the Key

Trial runs on guinea-pig operators indicate that it takes a little time to reeducate one's reflexes so that at high speed one can take full advantage of all of the sequencing functions and leeway tolerances. Full use of the seizure function calls for a considerable departure from standard techniques. However, the new tricks are readily acquired because they demand much less effort. One who has never used anything but a pump handle has a nice advantage and can master the gadget much faster because he has no cortical synapses to disconnect, nothing to unlearn. However, and this is the beauty of the thing, whatever technique is being used on the present bug or start-stop autokey will produce perfect results at usual sending speeds after 5 minutes of practice. Mastering the tricks simply calls for experimentation, using the functional summaries and specific examples as guides. Every operator will acquire his own personal technique, equally good but possibly different. Initial practice should be at low and moderate speeds to facilitate study of the relationships between the Selector-memory-sequencer, the time base, and the hand.

A bottom view of the key clinches the argument for allowing more room for the circuit components.

# Graphical Symbols for Radio Diagrams

*Including Criticisms of "Condenser" and "Capacity"*

BY HAROLD P. WESTMAN \*

• A new American Standard covering symbols for use in electrical circuit diagrams was adopted last year, and there is now under way a serious effort to persuade all users of such symbols to make their practices conform with it. The advantages of having one universal language instead of a large collection of dialects should be obvious, and beginning with this issue the symbols in *QST* schematic diagrams will be those of the new Standard.

GRAPHICAL SYMBOLS is the high-brow name for the drawings that we use in circuit diagrams. Originally, they were crude pictures of actual pieces of equipment but, to save time and to permit a drawing to represent more than one manufacturer's design of a part, the finer details were soon omitted and the pictures gradually lost their resemblance to the actual equipment. They developed into symbols rather than pictograms. In practice, this means that now we have to learn the meanings of these symbols because they don't look enough like the actual equipment for us to identify one from the other. Life does get complicated.

Those of us who are interested only in radio have learned quite a number of symbols and are entirely willing to go on using them until we find that they no longer suit our needs. This is also true of people concerned only with power applications of electricity. Unfortunately, these two groups paid very little attention to each other's symbols over the years with the result

that direct conflicts developed for such fundamental units as inductance, resistance, and capacitance.

During the second World War, the armed forces in the United States arranged something of the nature of a shotgun wedding and both the power and communication engineers agreed "for the duration" on a set of basic symbols that did not contradict each other. These were put in effect by *QST* at that time.

Unfortunately, there has been some tendency on both sides to drop back into our old habits and this was encouraged to some extent by the fact that the wartime action concerned only a few basic symbols; other points of confusion existed in the remainder of the standards.

### New Symbol Standards

After several years of work, a new American Standard<sup>1</sup> has been approved and it replaces five previous standards on electrical graphical symbols. This single standard includes symbols for both communication and power drawings. It contains symbols for all items that were in the previous standards and many more.

Numerous changes have been made so that the symbols will be consistent with each other and while in some cases more than one symbol is permitted for a given item, there are no cases where a symbol has more than one meaning. Thus, the reader should never be in doubt as to what the author intended even though the author may have had a choice as to the particular form of the symbol he would use.

In general, there will undoubtedly be a tendency for each group to use those new symbols that are most like the old familiar forms. In some cases, the new symbols are easier to draw and will be used for this reason.

Fig. 1 shows where the greatest conflicts were. The communication resistance and the power inductance were identical as were the communication capacitance and the power open contacts. Briefly, the power people gave up the

Fig. 1 — Symbols for basic electrical quantities as used originally by power and communication people, and the compromise symbols now standard for both groups.

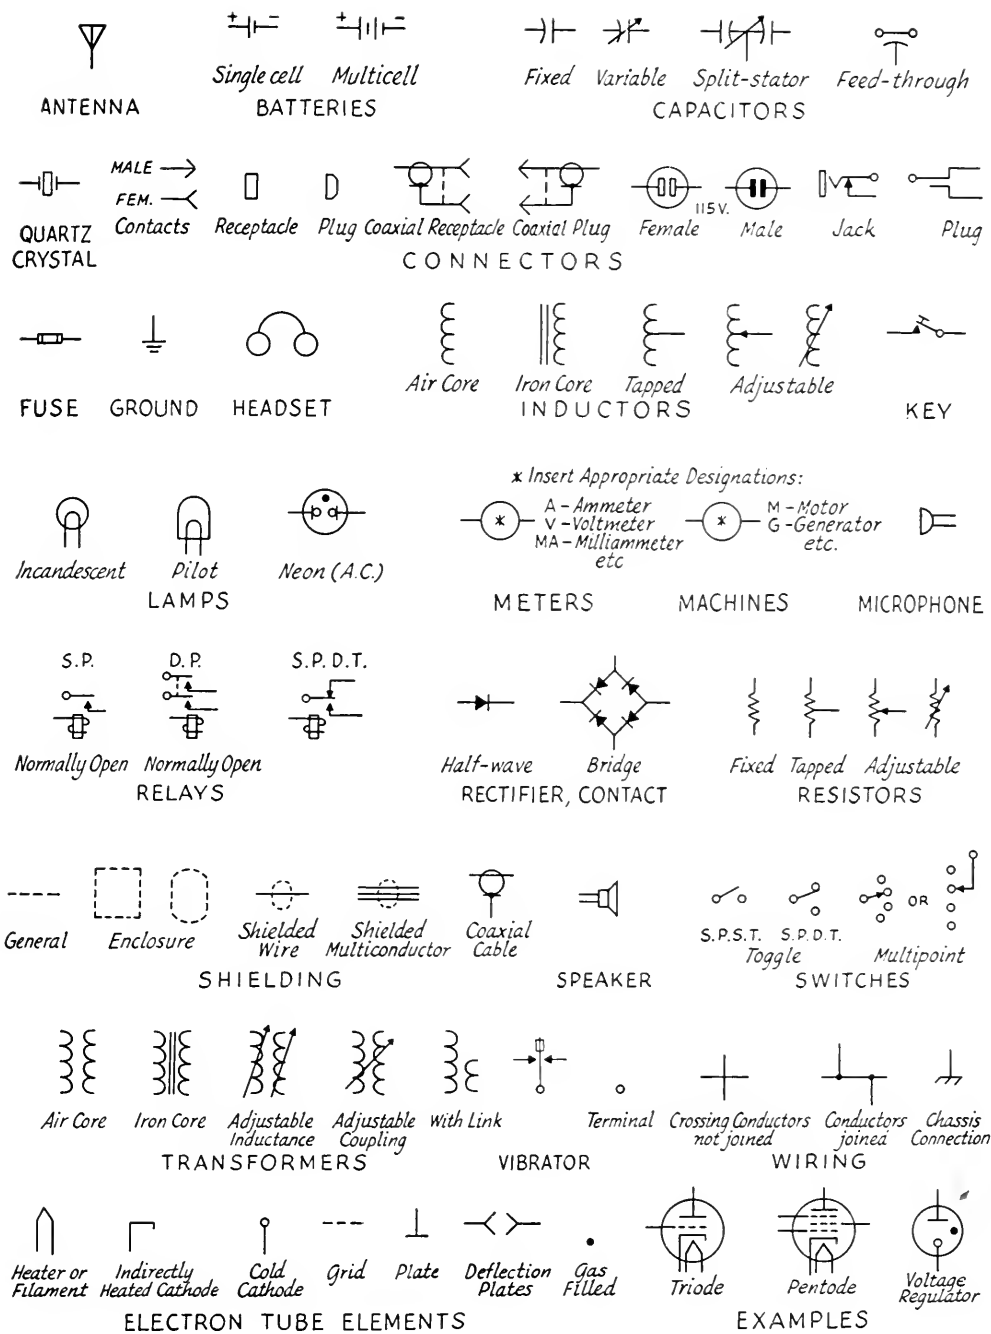

Fig. 2 — Representative symbols according to the new American Standard. These are typical of what will be the future QST practice, and in some cases involve a choice where alternatives are permissible. An important change is the omission of a "hook" where one wire crosses another without making a connection. A connection is shown by a dot.

The small circle is used only as a terminal (including a switch contact as a terminal) and does not represent a pivot in the switch and jack symbols shown above. Terminals may be indicated by adding the small circles to any component but the new Standard does not require their use.

Note particularly the symbol for a chassis connection. It does not imply that the chassis is connected to earth. If an actual ground connection is necessary, it will be indicated.

# A Radical Approach to Single Sideband

## Revolutionary Ideas for Simplifying 'Phone Communication

BY LARSON E. RAPP,\* W1OU

• Here is an article that no discerning 'phone man can afford to pass up. Although the ARRL Laboratory staff has not had an opportunity to confirm Mr. Rapp's findings, past experience with his disclosures have shown us (and our readers) what we can expect from this sage.

THERE can be no question in the mind of any active radio amateur that the most progressive step in the past pentad has been the immediate and wholehearted acceptance of single-sideband telephony. One has only to listen in on any of the low-frequency 'phone bands and hear the pioneers patiently explaining the virtues of s.s.b. to the younger and more timid amateurs to realize that some really splendid work is being done. Many old-timers can be heard jocularly referring to the medium as "Chinese modulation" or "those Donald Ducks," in an obvious effort to put the newcomers at ease.

However, because there is still some reluctance on the part of technically-unskilled amateurs to adopt single-sideband technique and thus enjoy its advantages, the author feels that the time is right to disclose his latest invention. Although originally developed for patent purposes only, the invention is too meritorious to be withheld from radio amateurs, who are always willing to try anything if it is simple and cheap enough. Ergo, before disclosing the invention and the circuits, it is well to review a few basic principles.

The generally-acknowledged advantages of single-sideband are greater effectiveness for the same total power to the transmitter, ability to use voice-operated break-in, and freedom from TVI. On the debit side of the ledger are the use of unfamiliar circuits, inability to use a.v.c. and S-meter at the receiver, and the tendency of SWLs to overlook such a signal in favor of one of the a.m. variety. It occurred to the author that what was needed to make single sideband universally acceptable was a simplification, both at the transmitting and at the receiving end, and this reasoning was confirmed by consultation with several other experts in this and allied fields. Since "a clear statement of the problem is the first step toward a solution,"<sup>1</sup> no time was lost in getting down to work. Through fortuitous and careful design, the eventual solution also overcame the objectionable characteristics of conventional (and now old-fashioned) s.s.b.

\* Kippering-on-the-Charles, Mass.

<sup>1</sup> Humperdink, E., "Orfeo ed Euridice," Part IV.

<sup>2</sup> Rapp, "The Double-Spectrum Theorem," *QST*, April, 1952.

### The Approach

Referring to the literature on single sideband, it is almost amusing to observe how blindly one investigator follows another in approaching the problem, with the inevitable result that they have all overlooked the very obvious simplification that will soon be disclosed. For example, every author starts out by describing a double-sideband-plus-carrier a.m. signal, and then laboriously tells of methods for first eliminating the carrier and then one sideband. It is this line of reasoning that has resulted in a blind spot in the thinking which, fortunately, is about to be removed.

Your author approached the problem from another tangent. Having observed that s.s.b. operators still suffer occasionally from BCI (interference to broadcast receivers), and recalling that narrow-band f.m. is immune to BCI troubles, combining the merits of n.f.m. with s.s.b. seemed like a fruitful avenue of approach. It was, and the final solution was really too good to be true. It is being disclosed now so that others can appreciate its advantages.

### The Solution

As all amateurs know, an f.m. signal is generated by a *reactance modulator* working on an oscillator to swing the frequency back and forth about a mean frequency called the *carrier* frequency. To generate a single-sideband-f.m. signal, the author cleverly reasoned that it was only necessary to swing the frequency *on one side of the carrier* — on the low side for the low sideband, and on the high side for the high, or upper, sideband. Fortunately, this offered no great problem, since part of the technique had already been disclosed in an earlier paper.<sup>2</sup> Hence, the generator for a s.s.b.-f.m. signal requires only a speech amplifier of sufficient gain, a "positive/negative" modulator driving a reactance modulator, and an oscillator followed by suitable amplifiers. The desired sideband is selected, of course, by switching to either the "positive" or the "negative" modulation condition.

Astute readers will immediately ask, "But what about carrier elimination?" This is a good question, but one that shows a lack of basic understanding of the system so far. It should be obvious that the carrier isn't present while it is busy swinging over the "sideband" portion of the spectrum, and hence *it is only necessary to eliminate the carrier while one isn't talking*. This is not a difficult problem, and is solved by the method current in vogue among the s.s.b. pioneers; namely, voice-operated break-in. By minimizing the "hold-in" time, the carrier is only apparent between very short pauses, and this

slight disadvantage is more than overshadowed by the obvious advantages of the entire system. A balanced modulator can be used, of course, if the ultimate in tube efficiency is desired, but the other method is the simple approach.

Unlike the old-fashioned s.s.b., this new system needs no carefully-designed mixers for band changing, since s.s.b.-f.m. is like conventional f.m. in this respect and requires only frequency multiplication for bandchanging. Furthermore, there is no real need for careful adjustment of linear amplifiers as there is with the older s.s.b., and a Class C amplifier will handle a single-sideband f.m. signal just as well as will a Class AB<sub>1</sub>, AB<sub>2</sub> or B amplifier. This feature eliminates the need for special bias supplies and an oscilloscope, as well as the need for careful adjustment when shifting frequency. The use of Class C stages throughout results in the highest possible efficiency, but care must be taken to prevent the generation of high-order harmonics that may interfere with TV reception in the vicinity. As a result of these tolerant parameters, s.s.b.-f.m. can be applied to any existing transmitter by making a few simple changes in the oscillator. A block diagram of the basic exciter is shown in Fig. 1.

Fig. 1 — A block diagram of the basic exciter.  $S_1$  is the sideband-selector switch. The "+" and "-" points are for upper- and lower-sideband operation — the third position gives conventional f.m. operation and is not necessary except for comparison and tune-up purposes.

and receiving tubes and low-power components can be used throughout

### The Reception of S.S.B.-F.M.

The reader may be wondering what must be done at the receiving end to copy a s.s.b.-f.m. signal and, we are proud to say, this is one of the delightful aspects of the system. It has been pointed out on several occasions that conventional s.s.b. is difficult to tune in — some observers report it is impossible with a conventional a.m. 'phone receiver — but s.s.b.-f.m. eliminates any and all such troubles. It is tuned just like narrow-band f.m. (Signal detuned slightly, to fall on one side or the other of the "slope" of the i.f. characteristic. This is called "slope detection," for obvious reasons.) However, one significant difference becomes immediately apparent, and it is one of the ways an operator can recognize a s.s.b.-f.m. signal in a band loaded with a.m., s.s.b. and n.f.m. signals. In the reception of s.s.b.-f.m., if the receiver is tuned to the *wrong side* of center, the speech becomes inverted, so there is actually only one correct side. Thus the selectivity of the receiver is

increased, because the signal only comes in at one spot on the dial. (Some operators object to the broadness of n.f.m., because it comes in at two spots on the dial. However, n.f.m. is, of course, a double-sideband system, and the two-spot tuning is not so surprising if you stop and think of it in

Fig. 2 — (A) Ideal i.f. characteristic for receiving s.s.b.-f.m. Selectable-sideband reception can be used. (B) Ideal i.f. characteristic for general s.s.b.-f.m. reception. Notice that this approaches the i.f. characteristic of current receivers.

this manner.) But, indubitably, the greatest advantage of s.s.b.-f.m. over old-fashioned s.s.b. is that *the need for careful tuning is eliminated*, since the s.s.b.-f.m. need only be tuned on the correct-slope side. There is no longer any need for careful carrier reinsertion! (Remember that the swinging of the carrier is generating the sideband. The carrier has never been eliminated, hence it does not require reinsertion.)

An ideal receiver i.f. characteristic for s.s.b.-f.m. would be one that looks like a right triangle, if everyone agrees to the use of only one sideband and whether it shall be the upper or the lower. Failing this, the best receiver characteristic would be one with a double-ramp configuration. Actually, however, the difference in performance between the ideal and a conventional i.f. characteristic is slight.

### Financial Considerations

Of interest to the impecunious amateur is the investment required for any new type of equipment. One of the criticisms of s.s.b. has been that it is too expensive, since it wastes the large audio tubes and transformers associated with a 'phone station. Unfortunately, s.s.b.-f.m. offers no solution for this complaint, if one already has reached the legal power limit. However, it is suggested that if one's present transmitter has not yet reached the legal limit (this varies throughout the world and even within countries), he may be able to sell his excess audio equipment to some hi-fi enthusiast among the Cadillac station-wagon set.

Any way it is computed, s.s.b.-f.m. is more economical than either a.m. or s.s.b. Its effectiveness being what it is, practically no time will be spent in making fruitless calls. And once QSO has been established, it is practically certain that no time will be wasted in needless repeats. On a strict dollar-for-dollar basis, a s.s.b.-f.m. transmitter shows a 47.2 per cent superiority over a kilowatt s.s.b. rig and a 71.4 per cent advantage over a kilowatt a.m. rig. *In hoc veritas.*

# Using the 6360 Dual Tetrode on 220 Mc.

## *Low-Cost All-Tetrode Transmitter for the 220-Mc. Beginner*

BY EDWARD P. TILTON, WHDQ, AND MASON P. SOUTHWORTH, W1VLH

UNLESS one is content to get along with the various receiving tubes that can be pressed into transmitter service, firing up on 220 Mc. can be a rather expensive proposition. The 832A, surplus variety, has been the only tube that would do the job at power levels above the receiving tubes, without setting the purchaser back a sizable piece of change. And now, unless you already have your 832s, they are no longer very attractive from the standpoint of price. Other tubes usable at 220 Mc. begin at around \$15.00, and range on up from there.

The 6360, a small dual tetrode introduced recently by Amperex, makes the 220-Mc. picture a little brighter. It won't handle quite as much power as its larger brothers, the 6252 and 5894A, but it works well on 220 Mc. and it sells at a receiving-tube price. The tube's low cost is largely

variety, to show newcomers that there are oscillators other than the overtone types used so often in recent years. The tetrode oscillator has an advantage, too; you can put in 8- or 12-Mc. crystals interchangeably. The oscillator plate circuit may be tuned to 24 Mc. or 36 Mc. if 12-Mc. crystals are used, allowing a choice of doubling or tripling in the second stage.

The oscillator is a 6CL6, as is the first multiplier. Type 5763s could probably be substituted in these stages, or a single 6360 can be used for both, if you want to standardize on one tube type. A balanced plate circuit is used in the multiplier, so that its output can be capacitively coupled to the 6360 tripler grids. We insert a hint at this point: If you run into trouble with insufficient grid drive to the 6360 tripler, try putting a small plastic trimmer between the low side of  $L_2$  and

The 220-Mc. tetrode transmitter. At the right are the 6CL6 crystal oscillator and multiplier stages, with the 6360 tripler and amplifier in the center and left, respectively. The rig is built on a sheet of aluminum which is screwed to an inverted chassis.

the result of its single-ended construction. All connections are brought out through the base, so it can be made on the same machinery that grids onto receiving tubes.

Actually, the 6360 is built a good deal like an oversized 6J6, with screens added. A central heater and cathode have pairs of other elements on either side. Compact construction and short leads result in a tube that works well on 220 Mc., and will even go to 420, in a pinch. One 6360, tripling, will drive another as a straight-through amplifier on 220 Mc., and that is how the tubes are used here.

### **Transmitter Circuit**

Circuitwise, the rig described here is a departure from the technique we have used in most v.h.f. transmitters described recently, in that a conventional tetrode crystal oscillator is used, rather than a triode in an overtone oscillator. This switch was made mainly for the sake of

ground, to balance up the capacitances on either side. It was not needed in the original, but it would be well to remember the suggestion, just in case.

The 6360 push-pull tripler to 220 Mc. is inductively coupled to the push-pull final stage. No neutralization is shown in Fig. 1. Should neutralization be needed, a method for achieving it is given later. Output from the final 6360 plate circuit is taken off through coax, and provision is made for tuning out the reactance of the link, with  $C_4$ .

### **Construction**

The transmitter is built on a flat plate of sheet aluminum 5 by 10 inches in size. This is screwed to a standard aluminum chassis of the same dimensions, that serves as both case and shielding. If more complete shielding is required, a perforated metal cover may be made to go over the top, as was done with the 6- and 2-meter rigs

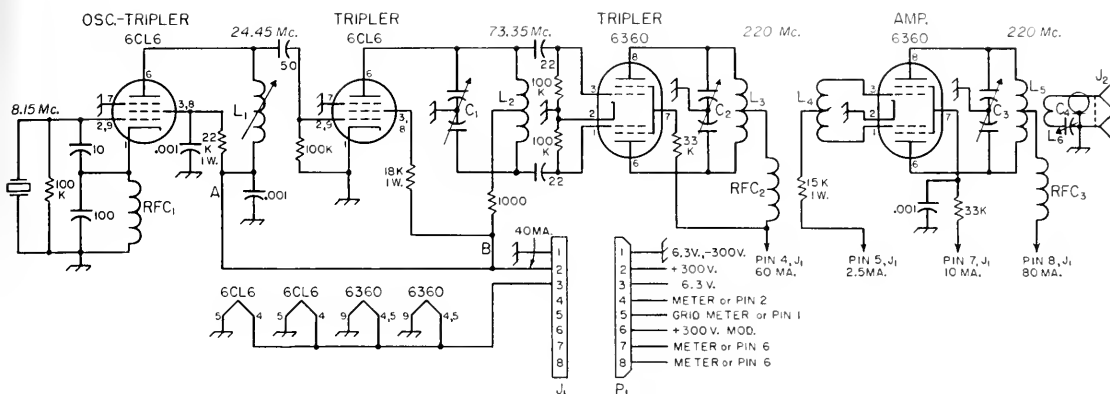

Fig. 1 — Schematic diagram and parts information for the 220-Mc. tetrode transmitter. Resistors are half watt unless otherwise specified. Capacitor values below 0.001 are in  $\mu\text{f}$ .; all ceramic.

$C_1$  — 11- $\mu\text{f}$ . miniature butterfly variable (Johnson 11MB11).

$C_2, C_3$  — 5- $\mu\text{f}$ . miniature butterfly variable (Johnson 5MB11).

$C_4$  — 15- $\mu\text{f}$ . miniature (Johnson 15M11).

$L_1$  — 14 turns No. 28 enam. on  $\frac{3}{8}$ -inch iron-slug form (National XR-91).

$L_2$  — 7 turns No. 20,  $\frac{1}{2}$ -inch diam.,  $\frac{3}{16}$  inch long, center-tapped (B & W Miniductor No. 3003).

$L_3, L_5$  — 4 turns No. 18 enam.,  $\frac{3}{8}$ -inch diam., center-tapped. Space twice diameter of wire, except for  $\frac{1}{8}$ -inch space at center.

described in October, 1954, *QST*. All parts except the power and coaxial output connectors are mounted on the top plate. The two connectors mount in holes in the rear wall of the chassis. The mounting screws are held in place on the fittings with nuts and other nuts on the outside of the chassis hold the fittings in position.

The tube sockets are along the centerline of the plate, two inches center to center, with the oscillator socket  $1\frac{3}{8}$  inch in from the right end, as seen in the photographs. The crystal socket and the oscillator plate coil,  $L_1$ , may be seen at the lower and upper right, respectively, in the bottom view. The tripler plate tuning capacitors are midway between their respective sockets.

Except for the power leads, there is no "wiring" in the usual sense, as all r.f. leads should be extremely short. The decoupling resistors and r.f. chokes in the various power circuits are supported on tie points. Three single-lug strips and

$L_4$  — 2 turns same as  $L_3$ , center-tapped. Adjust turns spacing and degree of coupling to  $L_3$  for maximum grid current.

$L_6$  — 2 turns same as  $L_5$ , close-wound. Adjust position at center of  $L_5$  for maximum output.

$J_1$  — 8-pin male chassis fitting (Amphenol 86-RCP8).

$J_2$  — Coaxial fitting, female (Amphenol 83-1R).

$P_1$  — 3-contact power cable connector, female (Amphenol 78-RS8).

RFC<sub>1</sub> — 750- $\mu\text{h}$ . r.f. choke (National R-33).

RFC<sub>2</sub>, RFC<sub>3</sub> — 17 turns No. 28 enam. on high value 1-watt resistor, or use Ohmite Z-235.

two double-lug ones are needed. All the power wiring is done with shielded wire, as an aid to TVI prevention. The coils  $L_2$ ,  $L_3$  and  $L_4$  are soldered directly to the stator support bars of their trimmers, with the shortest possible leads.

### Adjustment

The power supply for testing the transmitter should deliver at least 3 amperes at 6.3 volts, a.c. or d.c., and 200 to 300 volts d.c., at 200 ma. The lower voltage is plenty for the test work, though up to 300 may be used when everything is properly adjusted. If a 300-volt supply is used for the testing, the tubes can be protected from excessive drain by connecting a 5000-ohm 10-watt resistor in series with the power supply lead. The power connectors,  $J_1$  and  $P_1$ , make provision for metering all plate circuits except those of the oscillator and first tripler. The power leads to these are shown connected together, to Pin 2 of  $J_1$ , but during testing they should be fed sep-

Lifting the top plate of the 220-Mc. transmitter, in the position shown in the other photograph, the underside shows all the parts except the tubes and crystal. Note the method of attaching the power and coaxial fittings. Nuts hold their mounting screws in place, so that they can be fastened to the rear wall of the chassis.

arately through a milliammeter, as described below.

Testing will be easier if a receiver capable of tuning to 8 and 24 Mc. is available. Connect a 0-50 or 0-100 milliammeter between Pin 2 of  $J_1$  and the oscillator plate-screen circuit, at the low side of the 22,000-ohm screen-dropping resistor, point *A* on the schematic. Be sure that the tripler plate and screen resistors are disconnected for the time being, to prevent this stage from drawing current. Apply 200 to 300 volts d.c. through Pin 2 of  $P_1$ , and tune the plate circuit of the oscillator to the third harmonic of the crystal frequency. If you can listen on this frequency (24.45 to 25 Mc., depending on choice of crystal) a large increase in signal strength should be noted as the coil is tuned through resonance. A double check on frequency with a calibrated grid-dip or absorption wavemeter is recommended. Oscillator plate-screen current will be about 20 ma.

Now connect the oscillator plate-screen power lead directly to Pin 2 on  $J_1$ , and insert the meter in the lead to the tripler plate-screen circuit, point *B* on the diagram. Apply voltage and tune the tripler plate circuit for maximum output at 73.35 to 75 Mc. A 2-volt 60-ma. pilot lamp with a single-turn loop of insulated wire, about a half inch in diameter, may be coupled to  $L_2$  to serve as an output indicator. The 6CL6 tripler plate-screen current will be about the same as the oscillator, around 20 ma. at 300 volts.

Now wire the power leads to these two stages as shown in the diagram. Leave the 300-volt lead connected to Pin 2 of  $P_1$ , and connect a 100-ma. meter between Pins 2 and 4, to measure the 6360 tripler plate-screen current. A low-range milliammeter, about 0-10 ma., should be connected between Pin 5 and Pin 1, to measure final grid current. Tune  $C_2$  for maximum indication on this meter. With no plate voltage on the final stage, there should be at least 3 ma. grid current. Adjust the spacing between  $L_3$  and  $L_4$  carefully, retuning  $C_2$  after each adjustment, for maximum grid current.

In adjusting the final stage, we will ignore the eventual use of a modulator, and connect our power supply direct to the final stage temporarily. Information on modulation will be given later. Solder a jumper between Pins 2 and 4 on  $J_1$ , so that voltage will be supplied to the 6360 tripler. Connect a temporary jumper between Pin 2 and Pin 7, to feed voltage to the final screen, and connect the 0-100 milliammeter between Pins 2 and 8, to measure final plate current. A 10- or 15-watt light bulb may be used as a temporary dummy load, connected to  $J_2$ . Apply voltage and tune  $C_3$  for minimum plate current, or for maximum output as indicated in the lamp load. Adjust  $C_4$  for best output. The setting of  $C_4$  and the degree of coupling between  $L_5$  and  $L_3$  will be different for an antenna, however, as the lamp is not a good load at this frequency.

If the stage is completely stable, maximum output, maximum grid current and minimum plate current should all occur at the same setting

of the plate tuning capacitor,  $C_3$ . Another check for neutralization is to cut the drive for a brief period by removing plate and screen voltage from the tripler. Grid current should drop to zero when this is done. If it does not, the final stage is oscillating, and must be neutralized. In the original model, there was no actual self oscillation, but the stage was not completely stable until a small amount of neutralization was added.

This is done very simply with the 6360. The leads are so arranged within the tube that all that is required for neutralization is a very small capacitance between Pins 3 and 6, and between Pins 1 and 8. A stub of No. 18 wire about  $\frac{3}{8}$  inch long is soldered to Pin 6, with its opposite end "looking" at Pin 3. A similar stub is soldered to Pin 8, with its free end adjacent to Pin 1. The ends can then be bent toward or away from the grid pins to give the required capacitance.

### Putting the Rig on the Air

When all stages have been adjusted correctly, the plate voltage may be increased to 300 on all stages, if you want to run the maximum power of which the tubes are capable. Current drains indicated on the schematic diagram are for 300-volt operation. Staying at 250 volts or less allows more conservative operation, and may be well worth while, in the interest of longer life for the 6360s. There is no great advantage to be gained from pushing the tubes excessively, as doubling the power output will net less than one S unit improvement in signal level at the receiving end.

In feeding power to an antenna system using coaxial line, it is merely necessary to connect the coax to the output fitting,  $J_2$ , and adjust the coupling and  $C_4$  for maximum radiated power. A field-strength meter that will be helpful in this was described in *QST* for December, 1953, page 43. If 300-ohm Twin-Lead or open-wire line is used to feed the antenna, coupling to the transmitter is done with a coaxial balun, made as shown in Fig. 2. The balun may also be used

Fig. 2 — Coaxial line balun for feeding balanced loads from the 220-Mc. transmitter.

at the antenna end of the coax, if the antenna system is designed for 300-ohm balanced lines. The part of the balun that plugs into the transmitter can be of any convenient length.

To modulate the transmitter, the final plate and screen are fed through the secondary of the modulator output transformer, as shown schematically in Fig. 3. The circuit is shown in basic

(Continued on page 126)

# Director Beams

## *Improved V.H.F. Antenna Performance with Fewer Elements and No Reflectors*

BY FRANK C. JONES,\* W6AJF

**N**EARLY all v.h.f. beam antennas use resonant reflectors, to provide good forward gain and reduce signal pick-up and radiation from the rear of the array. However, an investigation of several types of beams conducted in the 220-Mc. band showed that it is possible to dispense with reflectors entirely. Furthermore, by modification of the usual collinear arrangement, a design was evolved that used only half as many directors as one would expect.

The result was a 6-element array with performance equivalent to that of the usual collinear arrangement having four half-wave driven elements, with reflectors. Two of these can be combined into a 12-element beam that is equal to the conventional 16-element design. Of even greater interest, the front-to-back ratio can actually be made better with directors only, without the usual sacrifice in forward gain that is entailed in adjusting for optimum front-to-back ratio.

If a reflector type of beam with four driven elements and four reflectors is adjusted for good front-to-back, over 12 db., the forward gain is reduced at least 1 db.; if it is adjusted for best forward gain, the front-to-back ratio is liable to be considerably less than 10 db. On the other hand, a director-type beam of four driven elements and two directors can be adjusted to provide more than 15 db. front-to-back ratio, without sacrificing more than  $1\frac{1}{2}$  db. forward gain.

An example is a 12-element 2-meter director beam at W6AJF that has a front-to-back of 17 db. and a forward gain of approximately 13 db. A conventional 16-element collinear array can be adjusted for about this same gain, but the back lobe becomes objectionable, so the usual dimensions provide about 12 db., with a front-to-back ratio of 10 to 12 db.

### *Something for Nothing?*

This better front-to-back and more forward gain with less elements in the array looks like

\* 850 Donner Ave., Sonoma, Calif.

◆  
A 6-element 2-meter array that outperforms the conventional 8-element job. It uses shortened driven elements in pairs, with a single director for each pair. W6AJF's daughter tries it on for size.  
◆

a claim of something for nothing, but such is not the case. There is a price. The director beam must be made with close director spacing to obtain good rejection off the back without sacrificing forward gain. This means low radiation resistance at the current points, less bandwidth and increased difficulty in matching the beams to standard transmission lines.

The bandwidth limitation is not serious at 144 or 220 Mc., as the director-type array has a bandwidth of about 5 Mc. in these bands, compared to 8 or 12 Mc. for the conventional collinear designs. The bandwidth of the director beam for 50 Mc. would be only about 2 Mc., and perhaps 12 Mc. or so at 420 Mc. These values are too low for full band coverage, so the design would have to be for the parts of these bands which are of primary interest. The bandwidth is ample for the 144- and 220-Mc. bands with design centers at 146 and 222.5 Mc.

A close-spaced director, whether used with one or two driven elements, detunes the driven elements and all elements have to be made a little longer than expected. For example, a director in this design is 39 inches long for the 2-meter band, and  $25\frac{1}{2}$  inches long for the 220-Mc. band. Fortunately, the driven elements can be tuned to resonance by a short stub, and the main transmission line tapped across this stub at the proper point for impedance matching. There is, therefore, no critical length for the driven elements in

such a system. Where two such 3-element bays are used a single stub can be used to resonate the entire system.

In certain arrays or with Yagis spaced a half wavelength apart, there is a bucking action of directors of one bay upon those of the other. Reflectors spaced a half wave apart aid slightly in the forward gain of a beam, especially in a 4- or 8-element design. Directors, on the other hand, tend to cancel each other's gain when used at half-wave spacings between bays. It was found that  $\frac{5}{8}$ - to  $\frac{3}{4}$ -wavelength spacing minimized this effect when two directors were used, but  $\frac{5}{8}$  wavelength was not sufficient spacing for two bays having four directors each in a broadside beam, in tests at W6AJF. A 2-meter vertically-polarized beam of this type had a very sharp front lobe, with large side lobes and less than expected forward gain. When the two 6-element Yagis that made up this array were cut apart and stacked vertically, a considerable improvement in forward gain resulted, and there was a marked reduction in the side lobes.

### One Director for Two Driven Elements

In stacking the 3-element design shown in Fig. 1 the director current maximum points are spaced about a wavelength apart, so there is no

Fig. 1—A single 3-element 2-meter array having shortened driven elements and one director. Gain of this system is 7 db. A balun for use with coaxial line is shown at the right.

appreciable cancellation. A broadside spacing (in vertical arrays) of about  $\frac{3}{4}$  wavelength (60 inches at 2 meters) seems a good compromise value as regards amplitude of side and back lobes.

The idea of using a single director with two driven elements, as shown in Fig. 1, was developed by Ralph Bykerk, W6YSD. Tests on 220 Mc. proved that actually more gain could be obtained with one director than with two, when using two half-wave driven elements, because of the close end-to-end spacing of directors when two are used. Gain measurements at 145 and 221 Mc. showed 7 db. gain with this simple 3-element beam, and front-to-back ratios as high as 30 db. Six-element beams of the type shown in Fig. 2 gave maximum values of 11 db. forward gain, with an average of 10 db. over the whole 144- and 220-Mc. bands.

The two driven elements were originally cut to 38 inches (for 2 meters) but a reduction of the radiating portions to 30 inches did not reduce the forward gain because the two current points were

moved down behind the director. Apparently, the gain of this arrangement compensated for the reduction in field strength, from the driven elements alone, when their current maximum points are brought to less than a half wave apart.

Fig. 2—Two 3-element arrays for 144 Mc. may be connected about  $\frac{3}{4}$  wavelength apart to make a 6-element beam having a gain of 10 db. or better.

The shorter driven elements require a longer tuning stub for the whole beam.

One 6-element array, shown in the photograph, uses 300-ohm Twin-Lead for all portions of the feed system. The driven elements are half-inch aluminum tubing 31 inches long, mounted on  $\frac{7}{16}$ -inch canvas bakelite insulators. The latter have short aluminum sleeves over them where they pierce the 1-inch mounting booms, leaving an insulation gap of about  $\frac{1}{2}$  inch on each side to the two driven elements. The main boom is 1-inch aluminum tubing 5 feet long, so the distance between the elements is 58 inches. The short booms on which the directors are mounted are 7 inches long, to allow a spacing from the driven elements of 6 inches. The directors, being mounted at their electrical centers, are not insulated.

The phasing line of 300-ohm Twin-Lead is not transposed. For this particular antenna the tuning stub was 32 inches long, with the 300-ohm feeder tapped up 3 inches from the shorted end. For test purposes, a balun was used at the feed point to step this impedance down to 75 ohms for connection to 75-ohm coaxial transmission line to the transmitter. Extreme care must be taken to maintain exactly equal line impedances and power input to the lines when comparing a beam with a standard dipole antenna for relative forward gain figures. These conditions are most readily met when coaxial line is used.

Another 2-meter 6-element beam was made with open-wire feeders. In this case the directors were 39 inches long, of  $\frac{1}{4}$ -inch diameter, mounted 6 inches in front of the driven elements, as before. The latter were 30 inches long, of the same material. End insulators were of fiber bakelite tubing,  $\frac{1}{2}$ -inch o.d. and  $\frac{1}{4}$ -inch i.d., to take the driven elements. This particular model had 54-inch spacing broadside, instead of the preferred value of about 60 inches. The tuning stub of open-wire line turned out to be 43 inches long, with the main transmission line tapped at 6 inches from the shorted end. The length of the stub should be adjusted for resonance at the band

# The "Tiny Tim" Portable

*A Complete Dry-Battery Station for 40 and 80 C.W.*

BY STUART D. COWAN, JR.,\* W1RST

• Here is a little item that many hams will like to have around the shack, since it has a variety of uses. The unit, which includes transmitter, receiver and battery power supply, has been variously used by the author in the field, on a boat, and in the home station for the thrill of operating real low power.

**W**EIGHING in at 18 lbs., "Tiny Tim" is a complete ham station in one compact case, for use in emergencies, portable operation on land or sea, or in your regular station for the thrill of real low-power work (or when the power fails).

"Tiny Tim" has been operated from my 19-foot Hurricane-class racing sloop on Long Island Sound, from my home location, and in the field. The little rig performs amazingly well considering its 2 watts of transmitter input. On 3510 kc. one Sunday night, a W4 and W2 were hooked on one call in a mountain of QRM. Signal-strength reports are nothing to write

home about, but almost solid QSOs are possible in most cases. The thrill of contacts with true low power is something you know only after you've tried it. And, *building* a rig, for a change, is good for many of us who sometimes lose sight of the values that made ham radio what it is today.

The rig is built in a steel utility cabinet 8 inches deep, 11 inches wide, and 12 inches high (Bud C-881). Two shelves, 5 by 8 inches, were cut from sheet aluminum. After bending one edge to permit bolting to the panel, each shelf ended up 4½ by 8 inches. The whole rig can be easily removed by disconnecting the batteries and unscrewing the front panel.

## The Receiver

The receiver is a simple regenerative type with a single stage of audio, but it works well. With a good antenna, strong signals pound in and you sometimes use the volume control which normally is wide open. Selectivity, of course, is not the best but good bandspread helps a lot.

While one coil to cover both 40 and 80 can be wound, two coils are recommended for maximum

\* 45 Park Ave., Old Greenwich, Conn.

The "Tiny Tim" with 'phones, key and crystal plugged in ready to go. The receiver is on the bottom and the transmitter at the top. The dial to the left is for the bandset condenser, the one to the right for bandspread tuning. The knob in between is the regeneration control, and the one to the right is the audio gain control. Above, left to right, are the indicator lamp, antenna terminals and switch, transmitter tuning control, and the meter. The four toggle switches are in the battery circuits. The holes at the right and on top are for ventilation.

Batteries — 4.5-volt — RCA VS-028; 3-volt — Burgess F2BP; 45-volt — Burgess Z30XX; or equivalents.  
All capacitances in  $\mu\text{f}$ . All fixed condensers mica.  
Coils wound on 1-inch-diameter 4-prong forms (Millen 45001).

Label all battery leads with small pieces of paper fastened to the leads with Scotch Tape.

***QST* for**

burn out, so you will want to have a 7-8-volt bulb handy.

Next to the bulb is the 3-position switch,  $S_1$ . When the switch is turned to the left to receive, the antenna is connected to the receiver. When the switch is in the middle (transmit) the link,  $L_2$ , is connected to the antenna. With the switch in the right-hand position (test) and the antenna terminals shorted, the tuning bulb is placed across the link and will light brightly when the transmitter is oscillating. With the short removed from the antenna terminals and the switch still in the test position, the bulb is in series with one leg of the feeders. Tune the condenser for maximum radiation (brightest bulb). Now that the antenna is taking the load, switch to transmit, which removes the bulb from the circuit and you're in business.

### The Antenna

The antenna is the key to success with low power (and with high power, too). So far, three antennas have been used with "Tiny Tim":

1) A 4-section automobile radio antenna (Ward SC-8) is mounted on the side of the cabinet (the whip can be pulled out easily, the mountings removed and the holes plugged with bezels, when desired). This antenna is base-loaded, using a coil  $2\frac{1}{2}$  inches in diameter with about 45 turns of No. 14 wire, and is worked against a ground consisting of four wires, each 10 feet long, joined like the spokes of a wheel, at 90 degrees to each other, pegged to the ground. The ground connection is to the junction of these radials. Better counterpoises are described in the ARRL *Handbook*, but this one works well. The advantage of this antenna is that it is easy to disconnect and pack up in a box. It is not very efficient for receiving or transmitting but it works. A center-loaded or top-loaded whip would increase efficiency but would not telescope into a short length like this does.

The rear panel of the cabinet is cut and hinged to permit easy bandchanging. Spare coils, key, crystals, as well as log and pencil, are stowed in racks inside the door. The three transmitter batteries are at the upper right, and the receiver batteries are below. Aluminum straps hold the batteries securely in place.

2) The stainless-steel rigging on our 19-foot sailboat was connected to one side of the link and worked against a  $4\frac{1}{2}$ -foot bronze center-board in the water. The loading coil and a series condenser were ready but not needed. This antenna, again, is not very efficient, but was the best possible under the often hectic conditions and limited space in a small sailboat!

3) The best antenna, by far, is one 136 feet long, as high as possible and in the clear. A good portable antenna can be made from solid copper trolling line, with nylon fishing line as combination insulator-halyards. A 72-ohm receiving-type line can be used as the feeder. This antenna can be rolled up on a light wooden reel, and works well.

Any antenna and antenna loading method can be used with "Tiny Tim" but the higher the antenna, the better the results. The rig could

# Emergency Power Distribution

## *Preparing for Field Day and Emergencies*

BY GERALD T. WHITE,\* W1WUJ

**I**N the rush of preparing for Field Days — and especially emergencies — little thought is given to a.c. power distribution beyond getting a generator and plugging in. The associated twisted bare connections, multiple cube taps, absence of fuses, and so on, not only make for lack of reliability but also create a personal hazard for everybody coming near the site.

Invariably, not enough electrical fittings are brought along, so off come more plugs and more twisted connections are made, only to come apart in the middle of a QSO. With no fuses in the circuit, especially in multiple-transmitter installations, one short-circuit puts everybody off the air. If the line voltage is in doubt, there *might* be available a multimeter of questionable accuracy (probably not having been used to read 115 volts a.c. since last Field Day). After poking the prods in the nearest spare outlet, they are usually left there to “monitor” the voltage. Only with luck will they fail to fall together and short.

After reviewing the situation it was decided to plan the a.c. power distribution system for the June, 1954, Field Day. The problem divided itself into three major categories: (1) generator, (2) feeder layout, and (3) feeder termination.

### **Generator**

The first problem, the generator, requires careful consideration. Both single- and three-phase generators are generally available. The most desirable generator is one with single-phase output, especially 220 volts center-tapped.

\* Lieut. Cmdr., USN, FAW-3 staff, NAS, Quonset Point, R. I.

W1WUJ's a.c. distribution panel includes the accessories mentioned in the text and serves as a useful piece of station and shop equipment in the interim between Field Days.

However, many c.d. groups may fall heir to military-surplus 3-phase 110-volt units, and these can be used if a few precautions are observed.

Maximum output should not be drawn from either a 220-volt single-phase center-tapped generator or a 110-volt 3-phase generator unless each leg is equally loaded. If multiple transmitters are placed on separate legs, the line-voltage fluctuations caused by transmitter keying are greatly reduced.

The engine governor should be adjusted to not less than 55 c.p.s. line frequency under full load. If it is set for 60 c.p.s. at no load, the frequency may drop to well below 50 c.p.s. under load and damage to equipment may result. The smaller generators are particularly susceptible to this fault. A 60-cycle electric clock can be used to check the line frequency if a regular frequency meter is not available. If the clock second hand covers much less than 50 seconds in a minute, look out! Almost all ham electronic equipment will operate properly above 60 c.p.s.; however, 60-cycle generators should not be pushed to much over 75 c.p.s. or the engine bearings are likely to be damaged under the prolonged excessive speed.

### **Power Distribution**

The second problem, feeder layout, should also be given careful thought. No fuses, switches, or ammeters should be placed in any wire that is common to two or more branch circuits. One side of each circuit should be grounded, if only by a short rod in moist earth, to help prevent shocks and to reduce the explosion hazard when gassing and servicing the generator. (People *will* attempt to service them while they are running!)

In a 3-phase Y-connected system, the common connection should be grounded. In a 3-phase delta fully-loaded system, one phase must have both sides above ground, so pick one fall guy and let him plan accordingly. However, if only 5 k.v.a. is required from a 7.5 k.v.a. generator, then there is no problem: just ignore one phase and use the junction of the other two phases as common and ground. It should be determined ahead of time which phase is regulated, and this phase should be used for the average (or heaviest) load and the line voltage adjusted accordingly to prevent excessively low voltage or equipment burnouts.

A fuse should be inserted in the “hot” wire of each feeder pair leaving the generator. These fuses should be only a little larger than each station needs, and the total fused current should not exceed the generator capacity. Each trans-

mitter site should have a separate feeder direct to the generator to reduce voltage drop, variations, outage, etc.

All transmitter, receiver, and other chassis at each site should be wired together and grounded. This will avoid r.f. burns and prevent the annoying tingle from the a.c. line by-passes found in most commercial equipment.

A source of adequate a.c. feeder cable is always a problem. Coaxial cable that is too old to be of further value in r.f. service makes excellent feeder cable. For high currents, connect the inner and outer conductors together and run two cables for the two conductors.<sup>1</sup>

### Terminal Facilities

The last, but equally important, problem is feeder termination. The receptacle panel should

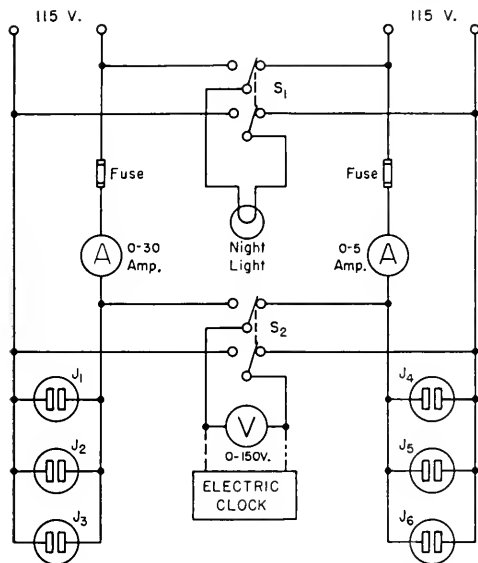

Fig. 1—Receptacle panel wiring. The number of outlets may be increased as desired.

contain at least eight outlets, protected by a fuse and monitored by a panel-type a.c. voltmeter, and a small night light. An a.c. ammeter is also desirable to help equalize loads on the generator. A frequency meter or an electric clock may be mounted on the panel so it will be available.

It will be noted in Fig. 1 that the night light is connected ahead of the fuses while the voltmeter is connected after the fuses and ammeters. This provides for instantaneous indication as to whether the local fuse blew, the ammeter opened up, or whether the main power failed.

Fig. 1 also shows two separate busses, in

<sup>1</sup> Feeder voltage drop can be estimated quickly by remembering that there will be one volt drop per ampere per 100 feet in a conductor having an area of 1000 circular mils. The drop is directly proportional to current and length, and inversely proportional to circular mil area. The center conductor of RG-8/U (5670 c.m.) would have a drop of 1 volt per hundred feet at a current of 5.67 amp. In a go-and-return circuit (two wires) the drop should be figured on the total wire length, of course. — Ed.

• It isn't too early to be getting ready for Field Day — and, of course, never too early to be getting ready for emergency operation. Planning for adequate power control and distribution is too often overshadowed by radio-equipment problems. Here are some ideas — many of them directly applicable to your own set-up, no doubt — that should stimulate constructive thinking and action.

anticipation that adequate cable would not always be available. One bus, with three duplex receptacles, is designed for a maximum of 30 amperes for transmitters, lights, and accessories. Under these circumstances, two separate pairs of feeders would be brought to the panel from the generator, thus providing better regulation for voltage-sensitive equipment. The two busses could be paralleled when satisfactory feeders are available. If fuses are provided at the generator end of the feeder, it will be desirable to insert smaller fuses at the receptacle panel than at the generator, to prevent blowing two fuses when a short circuit occurs.

It is not necessary to use expensive meters. There is at least one type of inexpensive meter on the market that is well-damped and is quite satisfactory.

The "quintet"-type receptacle, providing space for five flat or three round a.c. plugs, is far better and safer than using duplex receptacles with cube taps.

Besides its Field Day and emergency applications, the receptacle panel will be a most useful addition to any home workbench since it has adequate outlets and meters to service modern electronic equipment properly.

It is the author's belief that it is always better to do as much as possible in the home workshop before Field Day or an emergency and thereby avoid frustrating work under difficult conditions in the field.

## Strays

In Yosemite Valley, Calif., a ritual called the "fire-fall" is held nightly. A huge bonfire is pushed over a cliff located near Camp Curry. Before the ceremony, scores of blinking lights signal the group on top of the cliff.

W4NQD sent a "light" CQ from the fire area. He was answered from the valley by W9NDM/6 and W9ORY/6. Returning home, W4NQD confirmed by sending QSLs to the stations. Responses were:

To W4NQD/6: confirming our 5 X 10<sup>-9</sup> Mc. communication at 8:30 P.M. PST. Pwr: 0.3 watt. Xmtr: souped-up 2-cell air-cooled portable flashlight. Rvtr: 2 photosensitive receptory organs. Ur sigs RST 599. — W9NDM/6

Tnx W4NQD/6 for fine QSO on 6500 angstroms. Xmtr: 1-watt thermal resistor (flashlight). Rvtr: dual optic. Conds: excellent. Ant: 2-inch diameter parabola. — W9ORY/6

# Ferroxcube Cores and a High-Selectivity I.F. Amplifier

## *Design Notes and Suggestions for Improved Receiver Selectivity*

BY J. S. BELROSE,\* EX-VE7QH, EX-VE3BLW

• If you follow receiver design and improvements, you will be interested in this account of a new inductor-core material that can be easily used by the amateur. Several possible circuits are described, as well as the practical design data for a high-selectivity 20-ke. i.f. amplifier.

WITHIN the last few years there has been considerable interest in the development of the ideal communications receiver. The progress made toward this goal can be readily seen if one traces the development of commercial communications receivers during the past nine years.

The trend in receiver design has advanced from the simple but effective regenerative i.f. amplifier (single-signal superhets so popular in the prewar ARRL *Handbooks*) to the complicated triple-tuned and quadruple-tuned low-frequency i.f. amplifier of the present day. The mechanical filter (or magnetostriction filter) has recently been developed, and it provides an opportunity to obtain a maximum skirt selectivity and quite narrow bandwidths with a minimum number of stages. And, of course, we still have our old stand-by, the crystal filter. However, very high- $Q$  selective  $LC$  filters can be designed that will provide a maximum receiver selectivity and which can be easily constructed by the amateur radio designer.

Several excellent articles have appeared in *QST* on selective amplifiers.<sup>1,2,3</sup> The purpose of this article is to collect together some practical data, which the author has accumulated during the last few years of experimental receiver design, and to present these data in the form of notes for the amateur who prefers to build his own receiver. And, together with some simple circuit theory, an amplifier will be designed that has an extremely narrow bandwidth and excellent skirt selectivity. In conjunction with a good r.f. tuner, this amplifier will outperform any receiver which is at present commercially available. The recent advances made in the development of low-loss ferromagnetic-cored materials for high- $Q$  induc-

tors have made coil design and construction a pleasure, and they inspired the author to write this article. Since the heart of the amplifier is the highly-selective filter, it is necessary that a good portion of this article should be devoted to a general introduction to the use of these core materials.

### *General Considerations*

In the design of a communications receiver for radiotelegraphy, it is the author's opinion that a good receiver should be a double-conversion superhet and that the second i.f. should be as low as possible, in order to achieve the required selectivity and stability. Low-frequency amplifiers can readily be designed that have noise figures near to unity but, in any case, the over-all noise figure of the receiver is decided in the first stages, so this factor will not be considered here. Two stages of 455-ke. amplification should be provided to avoid image problems with the low second i.f. The 455-ke. signal should be fed to the second mixer at low level by means of a cathode follower. The signal-handling capacity of the stages before the narrow-bandwidth stages should have sufficient dynamic range to avoid cross-modulation distortion by strong adjacent-channel signals.

Operators not used to copying signals received through a very narrow bandwidth will find that this new experience requires some learning. The familiar ring of a keyed signal, so characteristic of a very selective crystal filter, is considerably reduced by the use of very selective bandpass coupled circuits. Hence, narrower bandwidths, for the same degree of ring, can be used. These circuits are in general designed to produce an optimum flat-top amplitude response. For signaling speeds of 20 w.p.m. and less, the keyed signal sounds clear and with little ring in a 30-cycle bandwidth, except under conditions of great interference of an impulse nature as, for example, local thunderstorm conditions. As the bandwidth is reduced below 20 cycles, the Morse characters start to run together and the information capacity of the channel approaches zero, as the bandwidth approaches zero. (The power required to transmit reliably a given rate of information approaches infinity.)

In the circuit design to follow, an amplifier bandwidth of 100 cycles is chosen because this bandwidth is easily obtained with presently-available circuit components. Additional narrow-band audio-frequency filters can be used if necessary after the signal is tuned in. The over-all circuit stability (from transmitter to receiver) re-

quired for operation with a 100-cycle filter is such as to require fine vernier action for the h.f. oscillator control, in order to "hold" the signal in the passband.

### Ferroxcube Pot Cores

If an air-wound coil is placed in a medium of permeability  $\mu$  times that of air, the self-inductance  $L$  will also be increased  $\mu$  times. Since the copper losses remain constant, the  $Q$  of the inductor will be increased. The resultant increase of the quality factor will depend on the additional losses introduced into the coil by the core. These losses may comprise eddy-current losses, hysteresis losses, and residual core losses. Recently, great advances have been made by manufacturers in producing ferromagnetic materials which introduce very small losses. Ferroxcube III is a low-loss manganese-zinc ferrite with a cubic crystal structure. The metal oxides are extruded in the form of a plastic mass and fired at a high temperature; the result is a material of extremely high resistivity and having mechanical properties which resemble porcelain. This material has many uses and is formed into quite a variety of component shapes. The "pot core" is a specially-designed form developed for very high- $Q$  coils as used in bandpass filters in carrier telephony and i.f. coils in radio engineering. As shown in Fig. 1, the pot core<sup>1</sup> consists of a ring, two disks, and a slug. The slug is slightly shorter than the ring, leaving an air gap in the otherwise closed magnetic circuit. The copper windings are wound on a small plastic bobbin. Since the turns are entirely surrounded by a material of high permeability, excellent shielding is provided, and coils can be placed quite close together without causing undesired coupling. The pot-core assembly can be bolted directly to the metal chassis

without affecting the  $Q$ . The effective inductance is slightly increased by grounding the core, since the distributed capacity effects are changed. However, this is only of the order of a few  $\mu\text{f}$ . The upper frequency limit for Ferroxcube tuned inductors is about 500 kc.

### Application of Pot Cores

If the tuned filter is to be used as the load impedance of a tuned amplifier, some special considerations are necessary in order to insure maximum stability for the inductance. With Ferroxcube, the permeability decreases (i.e., the inductance decreases) as a result of d.c. flowing through the windings and causing premagnetization of the core material. Another factor to consider is the low saturation properties of Ferroxcube. Therefore, if the sharply-tuned filter coil is included directly in the anode circuit of the output valves of the amplifier, where the anode current is likely to change with the signal voltage, the effect is to detune the filter and increase the bandwidth. The simplest method of reducing these effects is to tap the plate quite a way down on the inductor, so that the d.c. current flows through only a few turns of the coil. This results in additional advantages, since it reduces loading of the tuned circuit by the plate resistance of the valve, and provides a convenient means of reducing the stage gain. (The stage gain can become rather too high as a result of the large inductance values needed to tune to low frequencies with convenient sizes of tuning capacitors.)

The other important consideration for a coil wound on a magnetic core is the temperature coefficient of the core material. Because of the low Curie point (the temperature at which the permeability becomes practically unity) of Ferroxcube materials, the permeability of the material is quite temperature-sensitive. Since the inductance varies directly with the permeability, its temperature coefficient will be identical with that of the core. This temperature coefficient can be inadmissibly high for coils used in narrow-band sharply-tuned filters. The influence of the core material on the inductance must be de-

<sup>1</sup> Manufactured by Ferroxcube Corporation of America, and Philips' Industries, Eindhoven. Obtainable in Canada through Rodgers Majestic; in Great Britain through Mullard Components Division, and in the U. S. A. through Ferroxcube Corp., 97 Marshall St., North Adams, Mass.

Ferroxcube pot cores make it possible to build high- $Q$  inductors for "super-selective" i.f. amplifiers. The component parts and a complete assembly are shown here.

creased, and this is achieved by providing an air gap. In general, there is an optimum air-gap size for a given  $Q$ . In some cases, especially at low frequencies, it is desirable to choose an air gap larger than optimum for a given  $Q$ , in order to increase the stability of the coil. A larger air gap also reduces premagnetization effects. Therefore, the largest air gap for the given  $Q$  should always be used. As a general rule, the higher the frequency the greater the optimum size of the gap. For gaps larger than 0.5 mm. the core should be symmetrically located, leaving half the total tap at each end.

For frequencies less than about 30 kc. the best  $Q$  is obtained by winding the coil with solid enamel-covered wire (not silk-covered), with the

selectivity, and off-channel response. The stage gain should be kept low, to avoid trouble with oscillations caused by the difficulty of decoupling the stages at low i.f. frequencies. Single-tuned circuits are not recommended for use in the i.f. amplifier because they give a comparatively narrow passband and poor attenuation outside the passband (a crystal is a very high- $Q$  simple circuit). Capacitance or inductance coupling between two tuned circuits may be used to give a bandpass selectivity curve with good attenuation outside the passband. The coupling impedance may be in shunt connection, the so-called common coupling, or it may be in series, the so-called top-end coupling. Four common types are illustrated in Fig. 2.

Fig. 2 — Four common types of coupled circuits. A, B and C illustrate shunt coupling, and D is a form of series coupling.

wire size chosen to fill the available winding space for the particular value of inductance required. For frequencies above 30 kc., and most certainly for frequencies between 100 and 500 kc., the best  $Q$  is obtained by using litz wire. The number of turns required depends on the length of the air gap, since the effective permeability is a function of the air-gap size. For a given pot core and a given gap size,

$$N = \alpha \sqrt{L}$$

where  $L$  = inductance, mh.

$N$  = number of turns.

The factor  $\alpha$  is quoted by the material manufacturer, and inductors wound with the number of turns specified are generally within a few per cent of that required.

### Circuit Design Notes

Narrow bandpass filters will be discussed briefly in this section. In amplifier design the desired parameters are stage gain at resonance,

<sup>5</sup> Sturley, *Radio Receiver Design*, Chapman Hall, 1953, p. 443.

All of the methods of coupling shown in Fig. 2 give somewhat similar selectivity response curves near resonance (for near-to-critical coupling). The common inductance type, Fig. 2A, is superior for coupling that is slightly greater than critical, since both peak frequencies (of the double-humped response curve characteristic of overcoupled circuits) move away from the mid-frequency as  $L_m$  is increased. The response of this circuit is similar to that for a double-tuned inductively-coupled transformer in which the mutual inductance is equal to the common inductance,  $L_m$ . For the series-type coupling, only one limit frequency is affected.<sup>5</sup>

We next consider the selectivity far from resonance. Circuits of Figs. 2B and 2D are similar. For both these circuits the low-frequency skirt is the steepest obtainable, whereas there is some flattening out on the high-frequency side below about 60 db. down. The response of the circuit of Fig. 2A is somewhat better on the high-frequency side but somewhat worse (below about 80 db. down) on the low-frequency side. The circuit of Fig. 2C has the steepest obtainable response on the high-frequency side but is very much the worst of the lot on the low-frequency side, since the response starts to rise again about 8 kc. off on the low side (for circuit values to be considered later). At 20 kc., component values limit us to the use of the type of coupling shown in Figs. 2A and 2D, since practical values for  $C_m$  are rather high. It can be shown that the coefficients of coupling for these two circuits are

$$k \sim \frac{L_m}{L}, \text{ and } k \sim -\frac{C'_m}{C}$$

In general, the best off-channel response will be obtained by the use of combinations of both these circuits, as in the circuit of Fig. 3. For maximum-flat response, the circuits should be critically coupled; that is,

$$k_c = \frac{1}{Q}$$

Fig. 3 — Shunt- and series-coupling circuits can be combined for high-selectivity interstage coupling.

With critical coupling, the flat-topped character of the over-all response curve is, if anything, improved when a large number of stages is used. In general, any degree of selectivity, approaching the ideal flat-top response, can be obtained by using a sufficient number of stages and combinations of under-critical and over-critical coupling.

As will be seen later, the anode of the amplifier tube and the grid of the following amplifier stage are tapped down on the inductance  $L$ . This does

not in any way alter the response of the coupled circuits, since for the case considered,  $L \gg L_m$  and  $L \gg L_1$  (Fig. 5). And because the coil is surrounded by a material of very high permeability, the coupling between the two parts of the coil is almost perfect and the circuit approximates an ideal autotransformer, transforming impedance and voltage.

### Practical Circuits

The complete circuit of a practical amplifier is shown in Fig. 4. The 455-ke. signal is heterodyned in the 6BE6 mixer to 20 kc. by beating with a 435-ke. crystal (obtainable from surplus stock) and amplified by a three-stage double-tuned selective amplifier designed to produce a maximum-flat-topped response. The 20-kc. signal is heterodyned to 1 kc. (or whatever audio note is desired by the operator) by beating with a stable series-tuned Clapp-type oscillator. The series-tuned trap in the output filter following the second mixer is tuned to 20.5 kc. to reduce

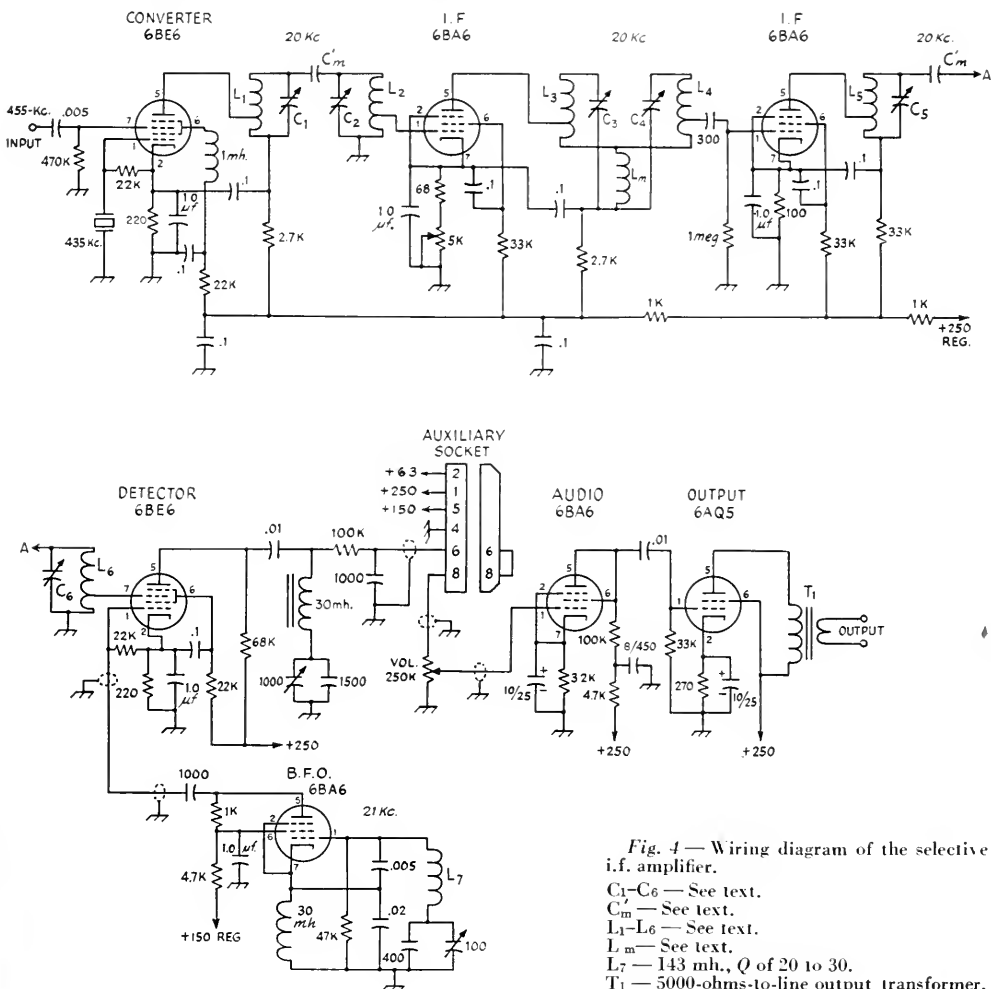

Fig. 4 — Wiring diagram of the selective i.f. amplifier.

$C_1$ — $C_6$  — See text.  
 $C_m$  — See text.  
 $L_1$ — $L_6$  — See text.  
 $L_m$  — See text.  
 $L_7$  — 143 mh.,  $Q$  of 20 to 30.  
 $T_1$  — 5000-ohms-to-line output transformer.

the i.f. and b.f.o.-oscillator signals at the grid of the first audio amplifier. The b.f.o. is tuned to the high side of the signal frequency. An octal socket

Fig. 5 — Equivalent circuit of an amplifier stage.

is wired so that a Selectoject can be used with the amplifier. When the Selectoject is not in use, an octal plug must be used to jump Pins 6 and 8. Other types of audio filters could also be used. (A double-tuned critically-coupled selective amplifier tuned to 1 kc., with a bandwidth of 30 cycles, has been experimentally used by the author with very excellent results.) The decoupling between stages may look elaborate, but adequate bypassing is quite difficult at 20 kc., where a 0.1- $\mu$ f. condenser looks like 80 ohms. After some experimentation the decoupling shown was adopted as a means of completely isolating the stages so the response curves are as calculated and not as modified by the regeneration introduced by the wiring.

#### Design of the 20-Kc. Tuned Circuits

The gain of an amplifier at resonance is

$$G = g_m Z$$

where  $g_m$  = transconductance of the valve in mhos, and

$$Z = \text{load impedance in ohms.}$$

For double-tuned critically-coupled circuits,

$$Z = \pi f L Q.$$

Now, if the anode of the amplifier and the grid of the following stage are tapped down on the filter, as shown in Fig. 5, the gain is

$$G \approx \left( \frac{L_1}{L} \right) g_m \pi f L Q$$

<sup>6</sup> Pot cores D-25/17.5 have now been superseded by type D-25/16 (i.e., the total height of the assembly is 16 mm. rather than 17.5 mm.). The only important advantage of these new pot cores is that a greater air gap is available than with the older type. The maximum air gap in the former type was 0.5 mm., whereas in the new type 0.85 mm. air gap is available for the Grade IIIB2 material. Grade IIIB1 is recommended for frequencies below 20 kc., whereas IIIB2 is recommended for frequencies above 20 kc. At 20 kc. similar  $Q$ s can be obtained with either type. For frequencies above 100 kc., use Type IIIB3. It is recommended that, if this new line of cores is available, Type IIIB2 with an air gap of 0.85 mm. be used at 20 kc., since this will result in a slightly improved temperature stability (here  $N = 93 \sqrt{L}$ ).

These new cores have not been used by the author, but it is thought that  $Q$ s between 150-170 should be easily obtained, since a  $Q$  of 150 was obtained by the author using a Type 25/17.5 pot core with an air gap of 1 mm. This air gap was experimentally ground by hand. However, it is not recommended that the air gap be altered unless accurate micrometers are available to insure a uniformity of the cores. The material is very hard and brittle, and grinding even a few fractions of a millimeter off the slug is a long, tedious job.

where  $L_1$  = inductance of tapped portion, and  $L$  = total inductance of coil.

This is so because the coefficient of coupling between  $L_1$  and  $L$  is almost unity when the windings are enclosed by a pot core.

Choose  $C' = 0.0035 \mu$ f. (convenient because a 0.003- $\mu$ f. fixed can be used with a 1000- $\mu$ f. trimmer);

then  $L = 18.1$  mh.

For a stage gain of 60 with a coil  $Q$  of 180 and a 6BA6 tube ( $g_m = 4400 \mu$ mhos),

$$L_1 = 1.2 \text{ mh.}$$

For the Ferroxcube type 25 pot core IIIB2 material with a 0.5-mm. air gap (Philips' type number D-25/17.5-11,00 — IIIB2)<sup>6</sup>

$$n = 65 \sqrt{L}$$

where  $L$  = inductance in mh.

Hence, we need a coil of 284 turns of No. 34 enamel wire tapped at 71 turns.

The coefficient of coupling

$$k_c = \frac{1}{Q} = \frac{1}{180} = 0.0055.$$

$$\text{Hence } C'_m = 0.0055 (3500) = 19.4 \mu\text{f.} \\ (\text{use } 18 \mu\text{f.})$$

$$\text{and } L_m = 0.0055 (18.1) = 0.1 \text{ mh.}$$

The coil  $L_m$  is wound on a small form having an adjustable slug. Each transformer assembly is completely enclosed in a sheet-metal box (20-gauge tinned steel) and short wires are brought out to connect to the external circuits. The boxes used by the author are 2 by 3 inches and 2½ inches high. These are easily bent into shape and the corners of the box soft-soldered. Short bolts with the heads removed are soldered in the

Fig. 6 — Selectivity characteristic of the i.f. amplifier.

corners of the shield box to bolt the assembly to the chassis. The trimmer capacitors are Arco Electric type 307-M padders. These are good for this application because both plates are insulated from the mounting screw and the trimmer can be mounted directly onto the top of the shield box. The trimmer is mounted on the inside face of the top of the shield box, with the slotted bolt for adjustment projecting through the top of the can for ease of tuning. The pot-core assemblies are bolted directly to the side of the shield box.

## Design for the Electronic-Key Manipulator

### Switching Lever for High-Speed Operation

BY M. A. MESSERSMITH,\* W7DRA

• At the higher keying speeds you have to go from dot to dash in a hurry if you want to turn out tape-like characters. Here's how an army bug was reworked into a high-speed c.k.m.

**D**URING the past few years many excellent electronic key designs have appeared in *QST*, and from these articles amateurs as well as commercial operators have built a number of efficient keys. Listen any week night to one of the fast c.w. amateur traffic nets and you will understand what I mean and what a large number are being used at the present time.

Some years back I built an electronic key from a circuit in *QST* and found it very satisfactory. In the *QST* article it was stated that the difference between operating the conventional style bug and an electronic key was that you operate the bug and the electronic key operates you. I found this to be true.

When comparing regular bug operating with tape transmission you will find the bug has a characteristic style for each individual because each of his hand actions is reflected in his transmission. At high speeds the characters are sharp and not uniform. On the other hand, the electronic key approaches tape very closely and the individual operator's characteristics are not present because, as already mentioned, you have to make your operating conform with the time-constant circuits, and as you coordinate with them you acquire rhythm to conform. Really most of the actual forming of the characters is out of your control — all you control is the spacing between the words and characters. And now we come to our story.

\* 1601 So. Mason, Tacoma, Wash.

At a speed of 30 w.p.m. there are approximately 25 time units per second, figuring 5 characters of two dashes and one dot each per word and giving three units to a dash, one to a dot, one to the space between each, and two units between characters. The electronic key will allow you three time units for going from a dash to dot (if the dash is self-completing) compared with only one unit when returning. So you see, in order to keep a good rhythmic style of transmitting at high speed, you require an operating mechanism with fast action and small movement when going

Fig. 1 — Reed dimensions and contact layout. The reed or arm should be made of dural.

from the dot to the dash side, since the available time is only about one twenty-fifth of a second.

I had previously used several different styles of keying devices but was never satisfied with them because as the speed increased it was difficult to keep constant rhythm because of excess motion and play. Keeping the above in mind, a study was made of several styles of keying mechanisms both in operating and on the bench, with the objective of constructing a device having fast action, self centering, and

(Continued on page 146)

Despite the almost microscopic movement of the paddle in going from dot to dash, the arm returns to center without overshoot when released. Practically any "bug" will lend itself to modifications similar to those made in this J-36.

# Communications Receiver Hints for the V.H.F. Man

## Simple Modifications To Improve Results with Crystal-Controlled Converters

BY EDWARD P. TILTON, WIHDQ

ONCE you've used a crystal-controlled converter for v.h.f. reception you'll never be satisfied with less. The stability afforded by crystal-controlled injection has probably been the greatest single factor in the vast improvement in reliable coverage that v.h.f. men have achieved in the last few years. But this has not come about without introducing a few objectionable features along with the benefits.

Spurious responses, for instance are much more troublesome when the i.f. is tuned and the front end of the receiving system is broadbanded.

Fine tuning of the general-coverage dial on most communications receivers can be accomplished through the installation of a vernier drive mechanism. This can be mounted on a plate that can be removed at any time, thus preventing any permanent defacing of the receiver.

And, as many a converter user has found out too late, there are very few communications receivers that have both tuning rate and tuning range adequate for the job of covering a 4-megacycle spread at 7 or 14 Mc.

The problem of unwanted signals has already been treated in some detail in *QST* by Van Dwyne and Treptau.<sup>1</sup> Their discussion was concerned mainly with converter circuit features that help to solve the problem. They showed methods for making the converter response curve flat-topped, with steep-sloping skirts. They also pointed to the need for keeping harmonics and subharmonics out of the energy supplied to the mixer stage from the oscillator-multiplier chain.

After the measures they describe have been taken, if there is still appreciable interference from signals riding through at the first inter-

<sup>1</sup> Van Dwyne and Treptau, "Notes on V.H.F. Converter Design," February, 1953, *QST*, page 52.

mediate frequency, some attention must be paid to the receiver with which the converter is used. Signals at 5 to 20 Mc. are likely to be very strong at times. It is hard to find a 4-megacycle spread anywhere in this region where leak-through won't occur at least part of the time, even with fairly good shielding. But our experiences with TVI have taught us that things that look like shielding and grounding may not actually be doing the job we require.

Take the antenna terminals used on many of today's receivers, for example. Fig. 1 shows a typical arrangement. A small bakelite strip on the back of the receiver has three screw terminals. The first is connected inside the chassis to a ground lug adjacent to the terminal board. The other two are the "doublet" terminals, to be used with any balanced-line feed. When an end-fed or coax-fed antenna is used a jumper connects Terminals 1 and 2, "grounding" them, and presumably also outer conductor of the coax. The inner conductor is connected to Terminal 3. The same arrangement is used when coax from a v.h.f. converter is run to the receiver antenna terminals.

That this method of connection can lead to much i.f. interference, through no fault of the receiver or converter, was discovered recently when a new NC-183D was placed in service at WIHDQ. When propagation was good in the 7-Mc. region, Radio Moscow and the BBC gave us considerable trouble. Other signals around 9 Mc. were almost equally annoying. Yet these signals had been no more than barely perceptible on a rack-model HRO-7 used previously. (The antenna connections on the rack job were inside

Fig. 1—Three-terminal antenna connection plate used on many receivers. To reduce i.f. pick-up when the receiver is used with crystal-controlled converters, remove the grounding wire from terminal No. 1 and ground externally.

the metal dust cover.) When a converter that used 14 to 18 Mc. was tried, the i.f. interference was intolerable on the new receiver.

Having had some previous experience with this sort of thing, we laid a screwdriver blade across from an exposed bare metal part on the 183D panel to the chassis of the converter. Down went the i.f. QRM! Yet what was wrong with the coax braid, already connecting the converter and receiver chassis? Nothing — except that the connection to the chassis is on the *inside* of the receiver, as shown in Fig. 1. There is no connection to the outside of the chassis, except through the rivet at the left edge terminal. Result: The wire from Terminal 1 to the ground rivet is a nice little coupling loop, and the converter is effectively an “antenna” for signals at the intermediate frequency!

The cure is obvious. Remove the loop connection on the inside of the chassis and make the ground on the outer wall. Use braid or copper strap, so that Terminals 1 and 2 are really at ground potential, outside the receiver.

If you have a very bad i.f. interference problem (like a 40-meter ham running a kilowatt in the next block) you may want to go a step further and shield the antenna terminals. On the NC-183D this was made very easy by the manufacturer; he provided the shield, ready-made, over the speaker terminals. By removing the bottom plate you have ready access to the back of the terminals on the rear wall of the chassis. Remove the short screws that hold the antenna terminal board and replace them with ones about  $\frac{3}{4}$  inch long, with the heads inside the receiver and retaining nuts outside. The shield box can then be mounted over the antenna terminal assembly, outside the chassis, in the same way that it originally covered the speaker terminals. If this doesn't cure your i.f. leak-through problems you need to go over the W2MLX-K2CEM suggestions again.

Of course, the really businesslike way to handle the shielding of the antenna input connections is to install a coaxial fitting on the rear of the receiver, and eliminate the terminal board entirely. The steps outlined above are for timid souls who can't bring themselves to drill holes in a commercial receiver, even in the back. If your receiver and converter are close together, try a strap bond between the two chassis.

And here's an operating hint that helps to reduce i.f. interference. If your converter has an i.f. amplifier, run its gain as high as possible, and the “r.f. gain” on the receiver as low as possible. Where the i.f. pick-up is the result of poor shielding in the receiver this will help appreciably. If the i.f. signals are fed through the converter front end, it will, of course, make no difference.

### What To Do About Tuning Rate?

It's a sad fact of two-dial receiver design that the general-coverage dial chases the kilocycles by just too fast to make for easy tuning of v.h.f. signals. And the bandspread dial never

covers enough tuning range to be of much use, except to the low-edge v.h.f. DX-hound. Single-dial receivers like the HRO, SX62, BC-342, BC-348, SP600JX and SX-73 are somewhat

Vernier drive mounting for using the National type AM dial with the NC-88 and 98 receivers.

better, but only the last three can be said to come close to the ideal in the tuning-rate department.

Some improvement can be achieved by selecting the intermediate frequency according to the receiver's qualifications as to tuning rate. Quite a few two-dial receivers spread out the kilocycles more at the low edge of the various ranges. The SX-71, S-76, NC-88 and NC-98, for example, tune much better at 5 Mc. than at 7. All receivers tune faster on each higher band. The kilocycles go by twice as fast at 14 Mc. as they do at 7.

Nearly all inexpensive two-dial receivers are next to useless for the crystal-converter man; they tune too fast on *any* range. The solution, then, is to slow down the movement of the general-coverage dial, to give us fewer kilocycles per degree of knob rotation. Fortunately, this can be done without making any permanent modifications in the receiver that might impair its resale value or appearance.

The photographs show how this is done. The example is the NC-98, but we've used the same general method on the SX-71, S-76, HQ-140-X and NC-183D with equally satisfactory results. Almost any vernier drive can be used, the first example shown being a Croname type 599 planetary drive. A metal mounting plate can be cut and bent to fit almost any receiver, so no specific dimensions are given here.

Use a volume control nut, a chassis retaining screw, or any handy removable screw or nut that appears on your front panel to hold the plate in place. The “CWO-Manual-AVC” switch mounting nut is used on the NC-98. Cut the sheet aluminum plate to suit your taste, mount the vernier drive in place, and you have a 5-to-1 reduction drive that will give you a tuning rate on the general-coverage dial that will closely

(Continued on page 152)

# A 5-Band Antenna Coupler

## Simplifying the "All-Band" Transmitter Loading Problem

BY LEWIS G. McCOY, W1ICP

A RECENT ARTICLE in *QST* described the construction and use of a standing-wave-ratio bridge.<sup>1</sup> It was pointed out that when the s.w.r. bridge was used in conjunction with an antenna coupler, one could easily match the output from his transmitter to the antenna system. Except for a few special types of antennas,<sup>2</sup> nearly all multiband systems need an antenna coupler to match the transmitter output to the feedline. If one is fortunate enough to have a separate antenna for each band, and each antenna is fed with an untuned, or "flat" (low s.w.r.), line, an antenna coupler is of course not required. However, most of us have to struggle along with a multiband antenna and use a tuned line. The purpose of this article is to describe a coupler that has enough flexibility to match practically any antenna system the average ham can dream up. In addition, for the benefit of the beginner, a few simple antenna systems will be described.

### The Circuit

There are two basic circuits used in antenna couplers: series or parallel tuning. Which circuit is used depends upon the antenna and feedline length in terms of wavelengths. In order to take care of the different conditions one is likely to encounter, an antenna coupler should be designed to use both types of tuning.

Fig. 1 shows the basic circuits that can be ob-

Fig. 1 — In the above drawing, A and B show two parallel tuning conditions: low- or high-C. Series tuning, low- or high-C, is shown at C and D.

<sup>1</sup> McCoy, "Meet the S.W.R. Bridge," *QST*, March, 1955.

<sup>2</sup> Where special matching devices are used to match the antenna to the impedance of the feedline on more than one band.

tained with the coupler to be described. The two capacitors shown are actually one split-stator variable — simple switching takes care of getting the different circuits. A fixed link is used on the coil, but the effective coupling is readily adjusted by varying the capacitor in series with the link.

The practical circuit is shown in Fig. 2. The switching mentioned above is accomplished by

Fig. 2 — Circuit diagram of the antenna coupler.   
C<sub>1</sub> — 320- $\mu$ mf. variable (Hammarlund MC325-M).   
C<sub>2</sub> — 100- $\mu$ mf. per-section variable (Hammarlund HF-BD-100-C).   
L<sub>1</sub>, L<sub>2</sub> — See text.   
J<sub>1</sub> — Coaxial receptacle (Amphenol 83-1R).

plugging in a suitably-connected bar plug — the letters beneath the plugs correspond to the four circuit conditions of Fig. 1. L<sub>1</sub> and L<sub>2</sub> are both mounted on another plug bar — only two coils are required to cover the bands 80 through 10 meters. Intermediate values of inductance are obtained by shorting turns with clip leads permanently mounted on the coil bar, as can be seen in one of the photographs.

### Construction

Although the parts for the antenna coupler might be mounted on a wooden base, we elected to mount them on a 3 × 5 × 10-inch chassis. The condenser spacings and coil wire sizes are adequate to handle powers up to about 500 watts input to the transmitter. Since the Novice cannot run more than 75 watts, the cost of the unit for low-powered applications can be reduced by substituting a smaller capacitor of the same range for C<sub>2</sub>. However, the Novice can build for future high-power days by using components with the

ratings given in the caption, with the assurance that the coupler will work just as well for him as it will for the ham with 500 watts.

The two coils and their links are made from a single length of B & W 3906 coil stock. To make the 80/40-meter coil, first count off 46 turns of the coil stock and cut this piece from the stock. Then unwind one turn from each end. This will provide leads to connect to the jack bar plug. Next, cut the 19th turn from each end, making the cut at the top of the coil (calling the side where the outside leads come off the "bottom"). The ends of the wires at these cuts are separated from the form and brought around to the bottom of the coil. We now have three coils of 18 turns, 6 turns, and 18 turns. The 6 turns at the center forms the link,  $L_1$ . The inside ends of the two 18-turn sections should be soldered together. This gives a coil for  $L_2$  consisting of 36 turns, with the 6-turn link,  $L_1$ , at the center. The leads are inserted in the jack bar plug (Millen 40305) and soldered. The last step is to mount clip leads on the coil ends, so that a portion of the coil can be shorted out for 40-meter operation.

The 20/15/10-meter coil is made up in a similar manner. The original piece of coil stock consists of 14 turns. The completed  $L_2$  has 8 turns, 4 each side of center, with a 2-turn link for  $L_1$ .

No specifications are given for tap points because these points may vary with the antenna system. The coil and shorting bar holders are made from Millen 41305 jack bars.

### Using the Coupler

Let's assume we have a half-wave dipole, 135 feet long, fed at the center with open-wire line. We'll start out first on 80 meters and work down through 10 meters, making notes on each setting of the coupler in order to have a permanent record. As pointed out in the s.w.r. bridge article,<sup>1</sup> one of the best methods for adjusting the coupler is with a bridge. The 80-meter coil is plugged into the unit and the feeders are attached to the antenna terminals. For a start, we'll use plug *B*, which will give us high-*C* parallel tuning. The

• One of the stumbling blocks among new amateurs is the problem of properly coupling the antenna to the transmitter. A flexible antenna coupler that will handle a wide variety of situations is the solution, and in this article WHCP describes such a device and how to use it. Since it will handle powers up to several hundred watts, it won't have to be rebuilt if and when you increase power.

bridge is connected by coax line to the transmitter temporarily with nothing connected to the output side of the bridge. The transmitter is set up near 3500 kc., or 3700 kc., if you are a Novice license holder, and full-scale reading is set on the bridge meter by adjusting the transmitter output or excitation. The coax line from the coupler is then connected to the output side of the bridge. The controls on the transmitter are left as they were for this particular frequency setting.

The two condensers,  $C_1$  and  $C_2$ , are then tuned for a null indication on the s.w.r. bridge meter. It should be possible to get a reading of zero or very close to it. If a good null isn't obtained, try the other plugs, starting with *A* and working through *D*. It may be necessary to tap in toward the center of the coil, but keep the taps as close to the coil ends as possible. Once a good null is obtained, mark down the settings, because as long as the same antenna system is used, the settings will remain the same. The procedure outlined above can be made for each 25 kc. throughout the 80-meter band, noting the settings at each spot frequency. In this way, one can quickly change frequency and always be sure the system is tuned on the button.

For 40 meters, the same procedure is followed, except that the coil is tapped down from the ends until a good null is obtained. With the antenna system used for testing the coupler, the taps were placed at eight turns in from the ends. However, different antenna systems may take different tap

Top view of the coupler with the high-frequency-range coil in place. The shorting-bar assembly is apparent behind the coil. The low-frequency coil and additional shorting bars are shown at the right.

points, so the correct spots must be found experimentally. Always keep the tap points as close to the ends of the coil as possible, consistent with a low s.w.r. Since the turns on the coil are too closely spaced to accommodate alligator clips, clip points can be made from ordinary soldering lugs soldered to the coil at the proper points.

After the 40-meter settings are noted, similar steps can be followed on 20, 15 and 10 meters. The correct settings for the taps are likely to be more critical than for the lower-frequency bands. In addition, it may be necessary to have more than one set of tap points for the entire 10-meter band.

With the procedure outlined above, it is of course assumed that one has an s.w.r. bridge or can borrow one. If none is available, the coupler can be tuned using an output indicator. An r.f. ammeter can be inserted in series with one of the feeder wires and the coupler tuned for maximum output, as indicated by the greatest reading obtainable on the ammeter. This is not as accurate as the bridge method of adjustment, because one cannot be sure the line between the transmitter and the coupler is perfectly matched. Dial lamps in series with the feedline or tapped across a section of line will also serve as output indicators, as

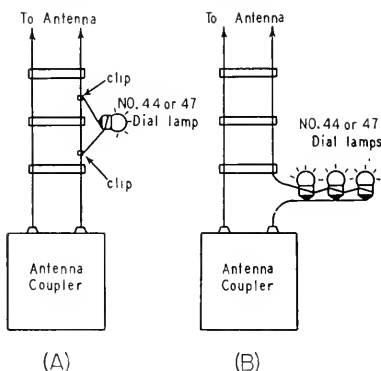

Fig. 3 — Dial lamps serve as an inexpensive output indicator, and either of the two systems shown above can be used. In A, a single dial lamp with one-foot leads is clipped onto the feedline. As the transmitter and coupler are tuned to maximum output, the dial lamp will light up. It may be necessary to move the clip leads up the line to find a point where sufficient coupling is obtained. At B, the dial lamps in parallel are connected in one of the feeders. To start out, all three bulbs should be connected to prevent possible burn-out. They can be disconnected one at a time until the best indication is obtained.

shown in Fig. 3. An absorption-type wavemeter<sup>3</sup> loosely coupled to the feedline can be used.

#### Center-Fed Antennas

A center-fed antenna doesn't have to be a specific length to work well. If you can make the antenna a half wavelength long at the lowest band, fine and dandy. But if your QTH is such that putting up a half-wave antenna would mean tying the far end to your neighbor's TV antenna,

<sup>3</sup>McCoy, "The Baking-Pan Wavemeter," *QST*, February, 1955.

In this view the link capacitor is shown at the bottom and the tuning capacitor at the top. The line connected to the coaxial socket is a short piece of 52-ohm cable.

use a little discretion and compromise with the ideal. A slightly shorter antenna won't show an appreciable difference in performance. The important thing about a center-fed antenna is to be sure that the feedline is connected at the exact center of the antenna and, if possible, that the feedline runs away from the antenna at right angles for a considerable distance. Some amateurs do this by bringing the feedline straight down from the horizontal antenna to a mast or pole and then running the feedline into the shack. The horizontal section of the feedline should, of course, be high enough to clear the heads of any pedestrians.

It is a good idea to make the length of the feedline plus one-half the antenna length a multiple of a quarter wavelength at the lowest operating frequency. A quarter wavelength is found by dividing 246 by the operating frequency in Mc. As an example, suppose the lowest operating frequency is 3.7 Mc.;  $246 \div 3.7 = 66\frac{1}{2}$  feet, so half the antenna plus the feedline would want to be  $66\frac{1}{2}$  (impractical because it makes either the antenna or the feedline too short), 133, or 200 feet long. If the antenna is 100 feet long, half of this is 50 and the feedline should be either 83 (133 - 50) or 150 (200 - 50) feet long. But if these feedline lengths are inconvenient, don't worry about it too much. Put up the antenna you can, with the feedline coming away from the center, and try tuning it on the bands available to you. There are some combinations that turn out to be a little awkward, but the antenna coupler can handle a wide variety of combinations. If you run up against one it can't, try lengthening or shortening the feedline a few feet.

#### End-Fed Antennas

The foregoing flexibility of antenna length does not apply to the end-fed "Zepp" antenna. In this case, if the feedline is not to radiate, the antenna length should be a half wavelength long, or a multiple of a half wavelength. Formulas and charts for these lengths are given in the *Handbook*. However, with the right antenna length, the preceding remarks about tune-up procedure hold, except that the preferred over-all lengths involve

(Continued on page 132)

# QST—Volume III

## Part II† — Foreword to Sumner B. Young's (WØCO) Index

The use of low-powered *spark sets*, operating on wavelengths *below 200 meters*, as a means of QRM avoidance, was a somewhat more practical suggestion; but it is probable that very few amateurs followed it. The main trouble was the lack of *receivers* capable of being tuned down to 100, 150, or 175 meters; and this difficulty was to continue for some time.<sup>21</sup>

An article describing a spark-coil transmitter for operation on 100, 150, and 200 meters (first suggested in a letter published at 26 to 27, October 1919), will be found at 13 to 14, February 1920.

An improved version of a spark-coil transmitter was later described in Volume IV (by Scott) at pages 55 to 56 of the December (1920) issue. Scott operated on 180 meters, and he suggested the use of waves down as low as 100 meters.<sup>22</sup>

In the February (1920) issue, at pages 23 to 24, and 26, there is a very interesting account of the discussions which occurred at the first Boston Inter-Club Convention. This meeting was called by Guy R. Entwistle, and was held on November 20, 1919. (See 14, January 1920.) Among other things, the use of wavelengths of 150, 175, and 200 meters, by spark-coil stations, was recommended.<sup>23</sup>

The editor of *QST* thought well of this idea; and he also suggested that all spark stations drop down to 175 meters, and use reduced power, for local and "moderately short-distance work."<sup>24</sup> [*italics* by S.B.Y.]

The decisions reached at the Boston Conference were referred to, with approval, by Mr. C. A. Service, jr. (Atlantic Division Manager of the ARRL), at pages 19 to 20, in the January (1920) issue.

The most-effective method of dealing with the interference problem, however, was through the use of "time schedules," and rules of operation, enforced by "strong" local or regional clubs or associations.

In this field, the Boston Conference (called by Mr. Entwistle) deserves credit for some wise

decisions; although its recommendations as to the enforcement of its policies were not as practical as those which were later developed in Chicago and embodied in the so-called "Chicago Plan."

At pages 19 to 20, January 1920, Mr. Service stated:

... The Division Manager wishes to mention a movement among the Boston amateurs which has come directly to his notice, that will sooner or later take form as a nationwide movement in all sections and communities where any radio congestion exists. There was a meeting held of representatives of prominent Boston and New England amateur associations. . . . The situation received a general preliminary discussion, the point of view of the spark coil, the experimenter, the relay station and the local amateur being presented and considered and the following tentative remedies being suggested.

1. Central control station for traffic and communication control, to see all have a fair show and no one encroaches on the rights of others.

2. Use of other waves besides and below 200 meters for local work.

3. Elimination of broadly tuned stations and thoughtless or willful interference.

4. Use of minimum power to ensure reliable communication.

5. Time limits for local and long-distance work.

6. Punishment for persistent offenders.

Amateurs from one coast to the other have been thinking this question over for years and the Boston convention is only one example of what other associations have done or tried to do.<sup>25</sup>

There was also some curiosity, on the part of U. S. A. amateurs, as to what kind of results the Canadian amateurs were obtaining, if they were actually using certain short wavelengths prescribed by law for use in certain locations.

At 27, September 1919, the plight of "Our Canadian Cousins" was discussed by E. T. Scholey, of Toronto:

... Perhaps a brief résumé of the Government regulations in Canada would not be out of place. They are rather hard for people living around the Great Lakes, for an amateur station within five miles of a government or commercial station or a

reception, by submarine or subterranean wires, probably has had plenty of attention from Army and Naval experts, recently. But *amateurs* can have little practical interest in such matters. The waves which we use are all too short for such techniques.

<sup>21</sup>Armstrong's superheterodyne, described in the "classic" article at 5 to 9, 15, February 1920, was said to be capable of reception down to 50 meters. See page 5, February 1920. However, these receivers were rarities.

The Grebe type AGP 101 Short-Wave Regenerative, first advertised in *QST* on the inside front cover of the September (1916) issue, was supposed to tune down as low as 150 meters. I suspect this was to allow easy tuning-in of a 200-meter signal.

The Grebe CR-5, CR-8, and CR-9 receivers, as advertised in the fall of 1921, had a bottom tuning range of 150. See 74, September 1921; 78, October 1921; 71, September 1921; and 97, October 1921 — all in Volume V.

At 21, March 1921 (Volume IV), the Clapp-Eastham

† Part I of "QST—Volume III" appeared in March, 1953; *QST*—"QST—Volume I" appeared in October, 1954; *QST*—"QST—Volume II" appeared in February, 1953, *QST*.

[Footnote 20; continued from p. 52, March *QST*]

Re these transmitting experiments, Matthews stated (at 19, July 1920): "... Experiments carried on between the Great Lakes Naval Radio Laboratory and a station in Chicago have shown that signals transmitted on underground wires are equal in intensity to those transmitted on any ordinary aerial, the only difficulty being the tendency of the underground wires to 'ground' when any considerable voltage is applied. For this reason only tube transmitters may be used with any satisfaction, although a low-voltage quenched set was used in these experiments with fair results. . . ."

My guess is that transmission and reception of waves shorter than 600 meters by use of subterranean or submarine antennae are not presently practised. Very-long-wave

route of navigation is restricted to a wavelength of 50 meters for transmission. Up to 25 miles distance the wavelength is 100 meters; seventy-five miles, 150 meters. The power input at the transformer terminals is limited to  $\frac{1}{2}$  kw. . . .

Later, some "relaxation" was allowed:

On December 30, 1919, the Department of the Naval Service, at Ottawa, authorized all Canadian amateurs "on the Great Lakes and River

St. Lawrence, from Port Arthur, Ontario, to Quebec, P. Q., to use a transmitting wavelength of 200 meters until the reopening of navigation, approximately the 15th of April, 1920." This concession was stated (in the Order itself) to be "in the nature of an experiment"; and the Department further announced that if no interference resulted, it was "prepared to consider a permanent amendment to the regulations regarding wavelengths." <sup>26</sup>

The inquiry, re experiences on short waves, was as follows:

In an editorial called "Greetings, Canadians!" Editor Warner announced that the League's Operating Department had been expanded to include Canadian Amateur Divisions. Then he said (at 15, January 1920):

. . . Can't we be of assistance in working out your technical problems? You are invited to make use of *QST* for this purpose. Relay transmission on 50 meters is an entirely new field to most of us, but we are sure it can be done. *QST* will welcome discussions and articles on this topic. For best results, should the transmission be by the usual spark method, by buzzer modulated v.t. oscillators, or by a big he-buzzer? What kind of a receiver will we have to have to get down to your fifty- or seventy-five meter wave? . . .

It is probable that our "Cousins" decided to put all of their energies into efforts to obtain permission to operate on 200 meters during part (or all) of the year; because I can find no evidence, anywhere in the first 5 volumes of *QST*, that American amateurs were ever given any useful information growing out of any actual use

type ZRFD receiver, tuning down to 175 meters, is described.

In the August (1921) issue, PeForest Radio Tel. & Tel. Co. advertised its Type MT-10 J Tuner (150 to 600 meters). See 107, August 1921 (Volume V).

<sup>22</sup> At 48, June 1920, Mr. Bowden Washington, chief engineer of Cutting & Washington, stated (in a letter) as follows: ". . . The writer some years ago put 4.6 amperes into an antenna 15 feet high and 25 feet long at a wavelength of 80 meters and a spark frequency of 1000. . . ." Spark sets would operate on 100 and 150 meters, all right.

At 64, January 1921 (Volume IV), F. B. Llewellyn's letter says that the U. S. Navy used a 52-meter wave for short-distance work during World War One (type of set not mentioned).

<sup>23</sup> 23, February 1921.

<sup>24</sup> See the editorial: "Reducing 'Legitimate' Interference," 17 to 18, February 1920.

<sup>25</sup> At 13 to 14, January 1920, it was stated that the problem of QRM control, at various centers, was becoming "most formidable." Local clubs were urged to grapple with it, and were also invited to affiliate with the League. The Traffic Manager recommended local control of QRM between the hours of 9 p.m. and midnight, "education" of the younger element, etc., etc.

In March (1920), an outstanding article on "Radio Club Organization," by F. H. Schnell and R. H. G. Mathews, was published. See 5 to 6, 21 to 22, March 1920.

The Tacoma Radio Club began controlling local QRM, promptly. See 31, March 1921 (Seefred Brothers' report). As to efforts made in Baltimore, Md., see 28, June 1920 (Service's report).

The rules and regulations adopted at Chicago, and placed in effect as of July 12, 1920, will be found at 38, August 1920 (Volume IV).

For a full exposition of "The Chicago Plan," see Mr. Mathews' paper, published at 23 to 25, May 1921 (Vol. IV).

As to the later spread of the Chicago Plan, see the follow-

of 50-, 75-, or 100-meter wavelengths by the Canadian hams.<sup>27</sup> *An opportunity to "discover something" surely was missed.*

This is an outstanding example of "how a horse can be led to water, but can't be forced to drink." And here, the "horse" evidently did not fancy the looks of the "water" which was in the short-wave "trough." *The 50-, 75-, and 100-meter waves must have appeared to be pretty useless, except for short-distance work on spark transmitters.* Amateur tube sets, operating on waves as short as these, were unknown; and when it came to receivers, most hams could reach only a very short distance below 200 meters. Personally, I can't blame the Canadian amateurs for acting as they did.

The real lesson appears (to me) to be this: In radio communication work, that which appears useless, or of little value "today," may be of considerable use, and of high value, "tomorrow."

A small amount of international traffic began to be handled between Canadian and U. S. A. amateur stations, at a few points.<sup>28</sup>

The League and its members could not give all their attention to the technical development of amateur radio, by any means. Postwar days brought a wave of proposed radio legislation.

The leading article on the subject, in Volume III, is entitled "The Amateur Situation," published at 5 to 6, September 1919.

This reports a visit of a League representative (or representatives) to Washington, and the discovery that the Secy. of the Navy had addressed a letter to both houses of Congress, setting forth the "Views of the Navy Department in connection

with references in Volume IV: adopted in Boston (Entwistle), 35, July 1921; Atlanta Radio Club adopts it (Merritt's report), 37, July 1921; adopted, with modifications, by Cleveland amateurs (Mathews' report), 47, April 1921; a scheme modeled on it is adopted in the Minneapolis-St. Paul (Minnesota) area. (Pray's report), 38, December 1920; advocated for country-wide use (by Scholtes), 22, April 1921; a lecture by Mathews inspires adoption of a similar scheme at Philadelphia, 42, April 1921.

<sup>26</sup> 8, March 1920.

Some Canadian hams later received special licenses allowing year-round operation on 200 meters. Canadian 9AL (at Toronto), for instance. See 38, June 1921 (Volume IV).

Note that the Canadian hams (despite their hard luck in other matters) got back on the air after World War One sooner than we did. J. O. Smith (at 16, September 1919) reported them as already being in operation; but he failed to give the date when this reopening had occurred.

<sup>27</sup> At 28, July 1920, in Service's report, there is a statement that "W. T. Fraser, District Superintendent Western New York, reports that tests with Toronto, Ont. were very satisfactory. No trouble was experienced in working them, but since navigation was opened they are allowed only (a) 50 meter wavelength. . . ."

At 34, July 1920, in Russell's report, we find these words: ". . . with the opening of navigation the wavelength allowed amateurs automatically dropped to the old 50 meters, thus pretty effectively cutting off any long distance work. . . ."

At 27, August 1920 (Volume IV), Russell notes the refusal of the Canadian authorities to allow the Canadian amateurs to remain on 200 meters during the navigation season. On the same page, he remarks that "This decision by the Naval Department emphasizes what has been preached by all the leading amateurs of this Division [the Ontario — S. B. Y.]; i.e., that c.w. transmission is the only solution for amateurs in Ontario compelled to work on so short a wave. . . ."

At 31, September 1920 (Volume IV), it is announced that

with certain aspects of radio communication." (This was known as "Document No. 165.")

A subcommittee of the Senate Committee on Naval Affairs, headed by Senator Poindexter, was found to be functioning as a special commission to study conditions. It was then reviewing the status of "world-wide radio" problems.

The subcommittee had asked the Navy Department to tender a draft of a law embodying

the desires of the Navy, as expressed in "Document No. 165," so that the subcommittee could study the same.

In the House of Representatives, the matter was in the hands of the Committee on Merchant Marine and Fisheries.

The article (in the September, 1919, *QST*) describes the contents of the Secretary's letter ("Doc. No. 165"), as follows:

... After reviewing the situation in detail from the Navy standpoint, the letter asks (1) the appointment of a special commission to study radio problems; (2) authorization to the President to designate specific bands of wavelengths for different classes of work; (3) a Navy monopoly of ship-to-shore radio; (4) a Navy monopoly of transoceanic and international radio; (5) authorization to use Navy radio stations for commercial and press business; (6) authorization to the Navy to assist American enterprise in the general development of American radio.<sup>29</sup> . . .

This article's recital of the discussions between the League's emissary (or emissaries), and the Navy Department (at Washington), merits extensive quotation. Note, also, that the late President Franklin D. Roosevelt was then Asst. Secretary of the Navy; and that in the absence of Secretary Josephus Daniels (who was then in Hawaii), he acted as one of several spokesmen for the Department in these talks.

... We found the Navy Department surprised that we should feel any alarm over the proposed legislation, as they point out that no mention of amateurs is made and that the amateur situation was not even considered by them in this matter. In turn, however, we have been obliged to point out to the Navy that they previously attempted to eliminate us and that the resulting skepticism, coupled with their postponement of our reopening August 1st as planned, causes the amateur to regard with distrust any move on their part to get control of radio. We really wanted to ask what assurances

they could give us that, if they secured control of all radio, the stringency of restrictions would not be increased to an extent resulting in our virtual elimination; but the legislation is not yet drawn up and we found the gentlemen wholly in sympathy with the cause of the amateurs and desirous of dispelling the distrust with which we have been regarding them. We told them we desired *recognition* in their contemplated legislation; i.e., rather than make no mention of amateur radio and leave our future to the discretion of some individual, we wanted our status defined in the new bill. The Office of the Director of Naval Communications, which is handling the matter, then invited us to tender our views of how the amateur should be recognized in the new law, and accordingly, as *QST* goes to press, a meeting of the ARRL Board of Directors is being called to formulate our ideas for presentation to the Navy Department and it is probable will also arrange to have us represented in force at the hearings of the bill, to make sure that nothing goes wrong, and that nothing inimical to our interests is contemplated in the Navy's request for "a comprehensive system of regulation and control" to achieve "the full utilization of radio for internal communication."

We are surprised to find no apparent connection between the postponement of our reopening on August 1st and the simultaneous request of the Navy for new legislation. They deny that we were held up to enable them to railroad thru a bill which would endanger us before their control automatically expires with a declaration of peace. But the sad fact remains that we are *not* opened, and no information is forthcoming *why*. Mr. Daniels is in Hawaii and the Assistant Secretary of the Navy stated Mr. Daniels personally disapproved the opening order and that he (Mr. Roosevelt) did not know why. . . . We pointed out to Mr. Roosevelt the bad odor overhanging the whole affair and the extreme desirability of a statement by the Navy explaining why we are held up and what we may expect, if the suspicion with which the amateur world regards the Navy Department is to be eliminated. Mr. Roosevelt promised to immediately radio Mr. Daniels,

Canadian 5BR, at Vancouver, B. C., is operating a half-kilowatt transmitter of some undisclosed type on 100 meters (Mumford's report). This probably was a spark set, I think.

The requirement that a 50-meter wavelength be used during the navigation season is referred to as a *handicap* in an editorial at 29, February 1921 (Volume IV).

Canadian 9AL had a special license to use 200 meters. See 38, June 1921 (Volume IV). This is in Russell's report.

In Hertz's report (32, April 1921, Volume IV), it is stated that the synchronous 360-cycle spark transmitters, found on some Canadian ships and shore stations, and used at one Canadian amateur station (5PC), might do well on short waves.

At 34 to 35, August 1921 (Volume V), Russell declares: "The short wavelength allowed the amateurs near routes of navigation makes it extremely difficult to do any DX work, although certain amateurs (ex-commercial operators), have been able to get licenses for 200 meters for all the year round. . . ."

The new April 1, 1922, Canadian regulations allowed general amateur stations to use spark on 180, and c.w. on 200 meters. Amateurs with special station licenses were permitted to use 275 meters on c.w., and 200 on spark. (See Russell's report, at 46, June 1922, in Volume V.)

Canadian 3GN (H. R. Byerlay, of Ingersoll, Ont.) operated his spark transmitter on 170 meters, and found that this was disadvantageous, because few receivers could tune down that low. He wanted to try 140-170 meters, but believed the receiver situation was even worse, down there. (See his letter, at 62 to 63, April 1922 Volume V.)

<sup>28</sup> At 17, September 1919, Entwistle asked amateurs in northern Maine and N. H. to cooperate with Albert J. Lorimer, of Montreal, in developing some trunklines between Canada and the Northeastern U. S. A.

At 26, March 1920, J. O. Smith said: ". . . The managers of the Atlantic, Central, Rocky Mountain and Pacific Divisions report, however, that considerable traffic is now being handled across the border. . . ." The reports cited don't support such a broad statement. Maybe they were cut down before publication.

Traffic Manager Smith, at 26, May 1920, stated: ". . . There has been much activity among Canadian amateurs during the past winter, and parts of Canada not heretofore represented in active relay work have become closely connected with activities in the states, by means of the trunk lines of the League, which have been extended into Canada with such excellent results. . . ."

Russell's report for the Ontario Division (at 33, June 1920) recites that ". . . Permanent daylight communication has now been established from Toronto to Buffalo via 8ZNI, and the new Niagara Falls station should also be in working order by the first week in May. . . ."

Lorimer's report re the St. Lawrence Division, at 45, June 1920, says:

"The route from this division to the United States was opened much sooner than had been anticipated and is now open for traffic.

"The attempt to work direct with 2SZ at Troy, N. Y., failed. Normally the Albany stations are QSA here.

"We have been advised by N. P. Mason of Plattsburg, N. Y., that his station 8BB could bring our route

and we hope to know soon just where we stand. Apparently Mr. Daniels personally is responsible. The whole proposition is so basically unjust, so uncalled for, that we do not believe it will long obtain.<sup>30</sup> . . .

Further news on the legislative "picture" was given in another editorial, at 11 to 12, October 1919. (This one was entitled: "Daniels Only Knows.")

The ARRL had caused a Resolution to be introduced in Congress, known as House Resolution 291. This had requested the Secretary of the Navy, "insofar as compatible with the public safety, to furnish reasons why the restrictions [had] not been removed." This document had been referred to the House Committee on the Merchant Marine and Fisheries.<sup>31</sup>

After reciting these facts, the editorial then reported that on August 28, 1919, the Navy Department had furnished to the Senate Committee on Naval Affairs a tentative draft of its new Radio Bill — the so-called "Government-monopoly" law.

The objections of the amateurs are thus stated:

. . . the big thing is that instead of providing regulations for wavelength, power, etc., this bill would provide for the existence of a technical radio

thru New York State to Albany, N. Y. A quick test was arranged from 2BF (Can.) and communication established with SBB with little trouble.

"SBB can route traffic east to 1VB at Hanover, N. H. and south to 2SZ and 2BM. As soon as an operating schedule can be arranged we will be able to handle traffic for points in Quebec.

"District Superintendent Jarest reports considerable activity in the vicinity of Levis, with new stations coming along fast. He will attempt to work a route thru to Northern Maine which will connect with the Atlantic route north of Boston. . . ."

At 31, June 1920, Pray's report contains the following paragraph:

" . . . Mr. Gjellhaug, Dist. Supt. for Northern Minnesota, reports that he has been testing with the station of the Radio Club of Winnipeg and expects soon to have a route across the border that can handle traffic regularly. He has had some correspondence with the Winnipeg Board of Trade, with some very good suggestions, regarding the status of radio relay work, which is expected to speed things up in that direction."

29, 5, September 1919.

Just what "American enterprise" there would be left, to "assist," if such a law had been enacted, I don't know.

<sup>30</sup> At 13, August 1919, an editorial called "The Lid" had reported the collapse of an expectation that the ban on transmitting would be lifted on August 1, 1919. The Navy Department had stated that the restriction would continue until the President should declare that a state of peace existed.

At 6, September 1919, it is said: ". . . Mr. Roosevelt stated we would be released 'as soon as Mr. Daniels would permit it' and in response to an inquiry addressed by a Senator, wrote that 'the Department has decided to remove the war-time restrictions on radio coincident with the proclamation of peace by the President.' . . ."

<sup>31</sup> This Resolution was not effective. However, Hon. William Stedman Greene, Chairman of the House Committee on The Merchant Marine and Fisheries, later prepared another (and similar) Resolution (H. J. Res. 217), directing the Secretary of the Navy to remove the Amateur restrictions. This evidently caused the Navy to act. See "The Champion of the Amateurs," at 5, November 1919.

<sup>32</sup> This was not the last to be heard from the so-called "Poindexter Bill," however. See 5 to 6, 12, December 1920 ("Dangerous Legislation Confronts Us"); and 28, June 1921 (both references are in Volume IV).

committee, composed of one representative from each department of the government, who in closed session would formulate and promulgate regulations concerning wavelength, power, decrement, purity, operating procedure, etc., for all the classes of stations. This new law states we should use no wavelength except that set for us by the committee, and then leave the regulations to be framed from time to time at the discretion of the committee instead of being definitely set forth in the law. This is small assurance for the continuance of amateur radio, with our destinies entirely in the hands of a government committee who would not be empowered even to hold public hearings where the affected classes of stations could explain their cases. . . .

The November (1919) issue of *QST* reported (see page 4, November 1919) that the Navy's proposed Bill had "died in Committee," and had not even been "reported out."<sup>32</sup>

— . . . —

Part III of W6CO's index to Volume III of *QST* will appear in a subsequent issue. — Ed.

**25 Years Ago**  
this month

April 1930

. . . The first editorial announces the ARRL Board of Directors meeting in Hartford on May 2nd and 3rd. In the second, Editor Warner expresses his pleasure concerning the increased occupancy of the 20-meter band, although he states that it isn't as great as it should be. In the last, note is made of the effect of sun-spot cycles upon the usefulness of high frequencies.

. . . The background and importance of amateur radio is the theme of a report concerning President Maxim's recent testimony to the Senate Committee on Interstate Commerce.

. . . Technical Editor James Lamb tells about experiments above 28 Mc. using new u.h.f. transmitters and antennas. NKF, the radio station of the Naval Research Laboratories, is the site of the investigations.

. . . The "Old Man" continues his war against the out-of-band boys in "Say, Son."

. . . "The Superiority of Screen-Grid Detectors" is persuasively discussed by Rydberg and Doty. Shown in the article is an experimental receiver using a UX-224 detector and a UY-227 audio stage.

. . . An a.c. operated receiver for c.w. is described by WSAYO. It features good performance on 20 meters and a low hum level.

. . . In "The ABC of Filter Design," Paul Zottu covers the subject in a simplified manner with practical mathematics.

. . . A multirange capacitor is described in "Revolutionary — and How!" by Otto Luther. It provides longitudinal as well as rotary motion of the shaft.

. . . "Radio-Controlled Airport Lights," by Belgrave Gostin, gives a résumé of recent tests in this new electronic application.

## FEED-BACK

W3OTC writes that the microphone transformer used in his 50-Mc. mobile rig (January *QST*) should have carried the type number A4705 instead of A4708. Actually, any small microphone transformer will do, of course.

# Hints and Kinks

## For the Experimenter

### OPERATING THE HEATHKIT MODELS VF-1 AND AT-1 AT 21 MC.

WITHOUT modification of one unit or the other, the VF-1 and AT-1 will not operate in combination at 21 Mc. The transmitter was designed for Novice use with crystal control. It employs a 5-Mc. crystal and operates with the oscillator plate circuit tuned to 10.5 Mc. when output at 21 Mc. is desired. In designing the VFO, however, it was desirable to produce a device with universal application, which would work with a majority of transmitters and use a minimum number of basic oscillator frequencies. As a result, the VF-1 was designed to deliver 7-Mc. output and must be followed by a frequency tripler if 21-Mc. excitation or output is to be made available. It is in this way that the incompatibility (at 21 Mc.) of the two units developed. Needless to say, the next model revision of the AT-1 will incorporate changes to clear up the matter.

Those who own Models VF-1 and AT-1 may make a simple modification to the transmitter which permits the VFO to be used "as is" for exciting the rig at 21 Mc. The change consists of adding a s.p.s.t. wafer switch to the plate circuit of the AT-1. The switch is used to open the 10.5-Mc. tap on the oscillator plate coil whenever the transmitter bandswitch is set at the 21-Mc. position. With the main switch so set, and with the new switch in the open position, the oscillator tank will cover the 7-Mc. range necessary for tripling into the 21-Mc. band. Naturally, with this method of operation, the 7-Mc. output from the VFO is fed straight through the oscillator to the grid of the 6L6 and the final is operated as a tripler.

The new switch should be mounted on the front panel of the AT-1 to the lower left of the meter. This places the wafer of the switch in front (as seen from the rear of the transmitter) of the oscillator plate coil. In rewiring the circuit, first disconnect the lead that runs to terminal No. 2 (see pictorial No. 2 of the Heathkit manual) at the top of the oscillator coil. Now, connect this lead to the rotor contact of the new switch and then add a short lead between the stator contact of the switch and terminal No. 2 of the coil. In other words, the s.p.s.t. wafer is wired in series with the 10.5-Mc. tap for the oscillator inductor.

Obviously, this extra switch does not represent the "ideal" in convenience. However, for those who wish to operate at 21 Mc., it is a far more desirable modification than would be one involving alterations to the VFO circuit. Furthermore, the change can be accomplished without any great expense or difficulty and permits

making use of 21-Mc. dial calibration of the VF-1.

— E. B. Mullings, W4MKZ/S

— — —

ALTHOUGH the popular Heathkit type AT-1 transmitter works properly when using crystal control, it will not perform satisfactorily at 21 Mc. when used in conjunction with the Heathkit model VF-1 VFO. The reason why the two units do not work together at this frequency has been explained by W4MKZ/S earlier and need not be repeated here. However, the method used here at W9RQT to remedy the condition may be of interest to those who do not wish to drill into the panel of their AT-1. The operation requires the addition of a single padder capacitor to the VFO and necessitates absolutely no modification to the transmitter. It does, however, eliminate the 11-meter range of the VF-1.

With the original VFO circuit, excitation for the 11-meter operation of a transmitter is obtained by switching in a padder that provides a VFO tuning range of 6740 to 6898 kc. This particular capacitor is the 4.5- to 25- $\mu\text{f}$ . job shown at the lower left-hand corner of the diagram for the model VF-1 (see Heathkit manual). By increasing the effective capacitance of this padder, it is possible to obtain a VFO range of 5250 to 5362 kc. I used a 50- $\mu\text{f}$ . silver mica as the new padder, but there is sufficient space available for the installation of a variable capacitor if the latter is preferred.

With the new set-up, the VFO unit is set at the old 11-meter position and the transmitter bandswitch is adjusted to the normal 21-Mc. position for output at the latter frequency. The 5-Mc. output from the VFO is then doubled in the AT-1 oscillator plate circuit and the final of the transmitter operates as a doubler as before.

The output coil for the VF-1 should be readjusted to peak the output at the new tuning range and the 11-meter scale of the dial can be recalibrated in terms of 21-Mc. frequencies. Excellent bandspread — nearly 180 degrees of the main tuning control — is obtained at 21 Mc. with the modification completed.

— Richard O. Bremigan, W9RQT

### GROUNDING SHAFTS OF VARIABLE CAPACITORS

LACKING other means of grounding  $\frac{1}{4}$ -inch shafts on variable capacitors, a small Type 8 grid cap (for 6J7s, etc.) slipped over the shaft behind the panel, and tied to ground with a sturdy wire, makes a very effective sliding contact.

— D. B. Angel, W8DBF

## GROUND AND POLARITY TESTER

**I**n the interest of safety, it is advisable to test all leads to ground (earth) for resistive characteristics. A resistive circuit or lead to ground is not a safe one and may not be depended on as a means of preventing accidental shock.

The simple circuit shown in Fig. 1 may be as familiar to many hams as it is new to others,

Fig. 1—Diagram of the simple ground tester described by W4UEB.

but it does provide one of the quickest means of checking the effectiveness of a ground lead. An ordinary lamp bulb of almost any wattage rating is used as the indicator for the tester. One terminal of the bulb is connected to a standard 115-volt plug and the second terminal of the lamp is connected to a heavy clip or probe which in turn is used to make contact with the ground point under test. The bulb will light to full brilliancy when connected between the a.c. line and a good ground point. On the other hand, less than normal brilliancy indicates a poor ground connection.

A second use for the simple circuit is that of testing for either the hot or the grounded side of the a.c. line. The bulb will light when the active side of the plug makes contact with the hot side of the a.c. receptacle and will fail to glow when contact is made with the grounded side of the line.

— Joseph A. Wright, jr., W4UEB

[EDITOR'S NOTE: Two precautions should be observed when using the lamp-bulb ground tester. When testing the effectiveness of a lead, make sure that the test lamp is lighted to full brilliancy by checking it against a lamp of similar rating that has been plugged into a convenient 115-volt socket. Second, when attempting to determine the polarity of an a.c. outlet, make sure that the test lamp is a good one; remember, a burned-out lamp won't glow even when connected to the hot side of the line.]

## MODIFYING COMMAND TRANSMITTER RELAYS FOR 6-VOLT OPERATION

**W**hen modifying Command transmitters, many hams discarded the seemingly useless antenna relay—the one with two coils and no standard contacts. Fortunately, I saved mine and have since found a good use for the units.

The keying relay for the transmitter is ideally

Fig. 2—Drawings of the Command transmitter relays. The 300-ohm winding of B is replaced with a 90-ohm coil from A in the modification suggested by W6BOQ.

suited for mobile gear because of its compact size and pair of s.p.s.t. contacts, but it won't operate on 6 volts. However, the 300-ohm coil for this relay can be easily replaced with one of the 90-ohm coils from the antenna relay. To complete the transfer, it is necessary to reduce slightly the length of the core for the 90-ohm winding, and this job can be quickly done with a hack saw and file. Removal and relocation of the coils is a simple task because each is held in place with a single flat-head screw.

The modified relay (Fig. 2B) really works on 6 volts and draws only 70 ma. or so from the battery. And the compactness involved is enough to catch the eyes of any mobile fan.

— K. M. Isbell, W6BOQ

## SIMPLE V.H.F. R.F. OUTPUT INDICATOR

**A**n inexpensive trimmer capacitor and an ordinary pilot lamp, wired in series as shown in Fig. 3, makes a useful output indicator for v.h.f. transmitters. An indicator of this type is es-

Fig. 3—Circuit of the simple v.h.f. output indicator. C, L and J are transmitter components; B and C1 are indicator components.

pecially helpful at v.h.f. where one of the most common indications of circuit resonance—minimum plate current—is frequently difficult to observe.

The indicator may be permanently connected across the series-tuned output circuit of a transmitter. A 3–30- $\mu$ f. trimmer and a 60-ma. bulb are used with the 30-watt rig here at W2FFY. The power consumed by the lamp, about a tenth of a watt, is negligible. By adjusting the trimmer and by employing lamps of various current ratings, the indicator circuit can be used with a wide range of power levels.

In addition to providing means for indicating maximum power output, the arrangement provides a continuous check on transmitter performance. The fact that the indicator is permanently connected across the output circuit prevents the need for retuning as is frequently the case when plug-in or clip-on indicators are temporarily installed.

— George E. Hyde, W2FFY

## T.R.F. FOR S.S.B.

49 Claude Ave.  
Denville, N. J.

Editor, *QST*:

I had an interesting experience recently which made me wonder if it had occurred to anyone else.

I set up an old SW-3 receiver (vintage of the 30s) for the first time in many years. After getting it into proper operating condition, I was checking it against my present modern superhet receiver and suddenly decided to see how it would perform on single-sideband signals. Quite a surprise! It performed remarkably well and proved in some respects comparable to the superhet.

For some time the general method of receiving single-sideband signals on a modern superhet receiver has called for the a.v.c. off, the beat oscillator on, the a.f. gain control up and the r.f. gain control varied according to input level; then starts the job of carefully tuning the b.f.o. for proper demodulation.

Well, the old t.r.f. doesn't have a v.c., is decently selective in its c.w. condition, has good sensitivity (controllable) and readily demodulates single-sideband signals. It has, of course, the disadvantage of being easily overloaded by excessively strong signals. However, for only three tubes it proved to be a remarkably usable receiver.

... All of this to prove that a receiver designed for conditions approximately twenty years ago is still acceptable for a method of transmission that was virtually unheard of in Hamdom at that time.

— W. J. Hicks, W2HQG

## INTERPLANETARY TRAFFIC

138 Cordova St.  
Syracuse 5, N. Y.

Editor, *QST*:

A suggestion to the traffic-handling fraternity. We who deliver overseas messages should be careful of the abbreviation MARS, whether by telephone or in writing.

Recipients of overseas messages can get some pretty wild ideas for which they can hardly be blamed. Is it their fault when we deliver to them a radiogram, the origin of which is, for example, "Korea via MARS," particularly when the remainder of the message is obviously genuine?

Unless we wish to perpetuate the general impression of ham radio as being a "kid's hobby" by adding this additional Buck Rogers angle of "—via MARS," it would be better when delivering overseas radiograms to mention that organization by its full name or punctuate the abbreviation.

— Jerome Blaisdell, W2IEP

## SINES

3434 74th Ave., SE  
Mercer Island, Wash.

Editor, *QST*:

I don't like to write to the editor, but my subject hardly has the makings for an article for *QST*, so guess I gotta do it this way.

Here's the deal: Almost without fail on a c.w. contact (as well as 'phone) names are exchanged. Right? You know — ur sigs hr are RST xxx; name hr is . . . , etc. That's fine for 'phone — doesn't take any longer to say "Uncle" or whatever, than to say "Ed" or sumpin. But . . . I've pounded brass commercially, in the Navy, and on ham circuits for nearly 50 years and in Navy and commercial work any "code" man who bothered with a name for a designation was "out of this world" or "sissy" or something. No respectable code operator (including railroad telegraphers, Western Union, RCA, Press Wireless, Mackay Radio, etc.) would even think of using anything but a sine of two, maybe three, and occasionally only *one* letter! This, of

course, was born of the practice of pinning down the commercial, Navy, or private telegrapher who actually receipted for the message, so the responsibility, in case of error, could be fixed. You know . . . dispatcher sends a train order and FS receipts for it by sending . . . , which (in International Morse) is his "sine." Or, an RCA man in New York sends one to Stavanger, Norway; it's receipted by Gustave somebody-or-other. Does he spell out R NR 1 GUSTAVE? Not by a darned sight — it's R GV and that's that!

My point is, let's write it up and boost it along in *QST* — c.w. men use sines of two or three letters. (Max, if it happens to be the guy's name, is also a good sine); 'phone men continue using *names!* Take a name like mine — just ain't no abbreviation worth a hoot, so I spell it all out, H-O-W-A-R-D? Not me! I've been using YB for a "sine" for better'n 40 years, and betcha I'm better known in ham, Navy and commercial circles than I'd ever be as Howard!

How about it — sines for c.w. men — names for 'phone operators — who'll go along with me on this?

— Howard S. Pyle, W7OE

## REAL TECHNICIAN

3776 Moorpark Avenue  
San Jose 28, Calif.

Editor, *QST*:

On the issue of allowing Technician Class holders to operate on a lower band. . . .

The question, I think, is not one of which to allow — 2 or 6 meters — but whether to allow either! Along with quite a few other hams, some Technician holders like myself, I do not want lower frequencies.

There are quite a few Novices who also hold Technician licenses and who will want to use them only after they have failed their General code test. They are mainly the ones who want these extra privileges even though they have done nothing to deserve them! They are seeking only easy operating conditions.

I have never held or ever will hold a Novice license. My sole purpose in amateur radio is to experiment with transmission on high frequencies, which I thought when I obtained it, was the Technician's purpose. I feel that any changes in its privileges would defeat this well-founded idea!

— Ron Rodd, K6IOM

## IT'S REALLY SO

25 Hilltop Road  
Philadelphia 18, Penna.

Editor, *QST*:

For many years now my fellow amateurs and I have been following the activities of the "Podunk Hollow Radio Club" as duly depicted on many covers of your excellent journal, *QST*. For an equal number of years I have been wondering what the significance of said organization might be. Granting the obvious fact that the purpose of the "Podunk Hollow Club" is aptly to demonstrate the foibles of club activities, we yet wonder about the selection of the term "Podunk Hollow" as the surreptitious name of the locale from which the club derives its members.

Having recently completed extensive research into the subject (quite by accident — began and completed fifteen minutes ago), I have discovered the real significance of the term "Podunk Hollow," which has been hidden from the members of the League. At first, one might suppose the term "Podunk" to be employed in the sense meaning countryish, small-townish, or hick. However, my research has disclosed an entirely different definition of the term — or rather the full term "Podunk Hollow."

This evening (the rig being out of commission), I pulled down a rather archaic volume from my father's bookcase. (Continued on page 148)

## A.R.R.L. CONVENTIONS

### FAR EASTERN PACIFIC DIVISION

*Agana, Guam — April 16th-17th*

The Marianas Amateur Radio Club is sponsoring the first ARRL convention to be held so far from Stateside. It will be held at Guam on April 16th-17th, and is under the jurisdiction of the Director of the Pacific Division. The convention has been approved by the military and all commands have been urged to cooperate. In conjunction with the convention, the Governor of Guam, Honorable Ford Q. Elvidge, has proclaimed the week of April 11th-17th as Radio Amateur Week of Guam. The program will include talks, papers, and discussions on interference, radio jamming, traffic handling, MARS program, civil defense, antennas, newest amateur equipment, single sideband, on-the-air courtesy, TVI, and harmonic suppression for those who rotate back to the States or foresee the coming of TV out "this-a-way." Civilians must make their own arrangements for quarters and eating. Further details may be had from the Marianas Amateur Radio Club, P. O. Box 145, Agana, Guam.

### OREGON STATE

*Portland, Oregon — May 7th-8th*

The ARRL Oregon State Convention, sponsored by the Oregon Amateur Radio Association, will be held May 7th-8th at the Portland Armory. Preregistration closes on April 25th. Those wishing to sign up early should write Helen M. Wise, W7RYM, 4311 S.E. Salmon St., Portland. Included on the program are lectures, contests, swap and shop, and tours. A fashion show and luncheon is planned for the ladies. The banquet will be held at 4:30 to enable those traveling long distances to attend. Preregistration fees: licensed amateurs, \$7.50; nonlicensed, \$3.50. Door fee: \$8.00 and \$4.00 respectively.

### COMING A.R.R.L. CONVENTIONS

April 16th-17th — Far Eastern Pacific Division, Agana, Guam

May 7th-8th — Oregon State, Portland, Ore.

May 21st-22nd — Pacific Division, Fresno, Calif.

June 10th-12th — West Gulf Division, Fort Worth, Texas

June 11th-12th — North Dakota State, Bismarck, N. D.

June 11th-12th — Southeastern Division, St. Petersburg, Fla.

August 12th-13th — Roanoke Division, Old Point, Va.

October 8th-9th — Central Division, South Bend, Ind.

October 22nd-23rd — Midwest Division, Omaha, Neb.

## Edison Award to W6VFT

Benjamin S. Hamilton, W6VFT, was recipient of the 1951 General Electric Edison Amateur Radio Award at a ceremony dinner held in Washington, D. C., on February 10th.

Congratulations are extended to Benjamin S. Hamilton, W6VFT (left), by FCDA Chief Val Peterson after the Edison Award was presented to him by J. M. Lang (center), manager of the GE Tube Department.

W6VFT, who resides in La Mesa, Calif., organized a top-notch radio network in San Diego county composed of an active 200-man civil defense radio system. In addition, he planned operational activities, wrote equipment specifications, and laid out the required physical facilities. Furthermore, he established an excellent communications system for the San Diego Chapter of the ARC. Mr. Hamilton serves as a communications officer with the 40th Division National Guard and is also an ARRL Section Emergency Coordinator.

Judges for the award were former Governor Val Peterson of Nebraska, FCDA administrator; Honorable E. M. Webster, FCC Commissioner; E. Roland Harriman, president, ARC; and ARRL President Goodwin L. Dosland, W0TSN.

The presentation ceremony was held at the Mayflower Hotel. Principal speaker for the occasion was Mr. Peterson, who paid this tribute to the importance of amateur communications: "... No matter how effective an enemy attack is, it can never destroy all of the amateur radio installations — the 120,000 of them — and that is why they are so important to civil defense and to the nation. ... I am not sure but what the first communications in the first few hours after an attack will be by amateur radio."

A special citation was also given to Carl J. Theis, WSBKH, who designs and builds radio equipment for use by Baptist missionaries in Liberia. Another special citation went to Carter Rogers, W8NCS, who operated continuously for 16 hours when a flash flood rendered the usual communications facilities of Richwood, W. Va., inoperable. In addition, 800 amateurs who participated in emergency operations during Hurricanes Carol, Edna, and Hazel were issued special certificates of recognition.

# YL NEWS and VIEWS

BY ELEANOR WILSON,\* W1QON

## YL Clubs

Recent years have seen the organization of several new YL clubs; we predict the formation of many new ones shortly. This month we'd like to make a start in the project of compiling information about the various existing clubs which are on record with us. If you are a member of a YL club which is "organized" — i.e., has formal name, officers, regular meetings, etc., — and your club does not appear below — please mail us a postcard with information about your organization.

In past departments we have already described two NYL clubs — NYLs of members of the Evansville, Ind., A.R.C., and NYLs of members of the Southwest Missouri A.R.C. If there are others, we'd like to know about them, too.

*The Young Ladies' Radio League* — International, with a number of affiliated YLRL units. Organized in 1939 by W3MSU, Ethel Smith, then W7FWB; approximately 550 members, all licensed women amateurs; dues \$2.00 per year; president, W6CEE, Vada Letcher, 1214-A Franklin, Santa Monica, Calif.; publishes *YL Harmonics* bimonthly; sponsors YL-OM Contest and YLRL Anniversary Party annually; conducts various nets; issues WAS-YL certificate and YL Century Certificate.

*Young Ladies' Radio Club of Los Angeles* — YLRL-affiliated; organized 1946; 55 members; meets second Saturday of each month at Schabers Cafeteria, 720 S. Hill St., Los Angeles; dues \$1.00 per year; president, W6PJU, Mildred Griffin, 1434 So. Olive St., Santa Ana; issues *Lad n' Lassie* Certificate.

*YL Radio Club of San Francisco* — a YLRL unit; organized 1954; 18 members; meets third Tuesday of each month at members' homes; dues \$4.00 per year for resident members, nonresident \$1.00 per year; president, W6QMO, Jeri Bey, 1530 47th Ave., San Francisco 22.

*Chicago Unit of the YLRL* — organized 1953; 20 members; meets on the fourth Saturday of the month at Gompers Park Field House; no dues; club station is W9DEQ; president, W9SEZ, Eleanor Engebretsen, 4304 No. Avers, Chicago 18, Ill.

\*YL Editor, *QST*. Please send all contributions to W1QON's home address: 318 Fisher St., Walpole, Mass.

## COMING YL GET-TOGETHERS

April 23rd — W1 YLs, Sheraton Plaza Hotel, Boston. Write W1TRE for details.  
May 20th-22nd — LARK Convention, W9 YLs, Alterton Hotel, Chicago. Write W9MYC.  
June 24th-27th — First YLRL International Convention, Hotel Miramar, Santa Monica, Calif. W6UIA, general chairman.

*The Ladies Amateur Radio Klub (LARK)* — a YLRL unit; organized 1952; 28 members; meets first Wednesday of the month at Austin YMCA, 501 No. Central Ave., Chicago; dues \$3.00 per year; president W9YBC, Gloria Matuska, 2322 So. 2nd Ave., North Riverside, Ill.; issues LARK certificate.

*Long Island Unit YL Radio League* — organized 1950; 20 members; meets monthly at members' homes; dues \$1.00 per year; president, KN2EBU, Min Jordan.

*New York City YLRL* — A YLRL unit; reorganized in 1912; 22 licensed members; meets monthly at N. Y. C. Civil Defense Building; dues \$1.00 per year; president, W2IQP, Lillian Klarfeld, 148 Leslie St., Newark 8, N. J.

*South African Women's Radio Club* — 117 members; president, ZS1GT, Daphne Hindes, "Westward Ho," 22 Beta Road, Bakoven, Cape Town, South Africa; publishes YL Beam bimonthly; will soon issue a Worked-ZS YL certificate.

*YLRL Club of Milwaukee (Wis.)* — organized 1953; 8 members; meets six times a year at members' homes; no dues; president, W9OMZ, Jeanne Pavak, 5776 No. 24th St., Milwaukee 9, Wis.

Even as this copy is being prepared, word arrives from W17BJD that on Feb. 14th twelve KL7 YLs met in Anchorage for the purpose of organizing an Alaskan YL Club. More details on this at a later date.

The above information is up-to-date as of February, 1955. All of the clubs welcome new members. For further particulars write to the club president.

The officers of each club are decidedly optimistic about the future. They foresee increased membership, greater club activity, and more significant contributions to amateur radio in general.

## Anniversary Party Results

Winners of the YLRL 15th Anniversary Party conducted during the first two week ends of last December are as follows:

### 'Phone

First — W3OQF (opg. W3MAX), Barbara Houston — 22,320

Second — W8H1WX, Lillian Richardson — 17,100

Third — W4YYJ, Lois Crane — 16,582.5

### C.W.

First — W4YYJ, Lois Crane — 6612.5

Second — W4H1LF, Arlie Hager — 6375

Second (tie) — W1FTJ, Dorothy Evans — 6375

Third — W1WPX, Evelyn Chase — 5362.5

'Phone section winner W3OQF has been aiming for top honors since 1951, when she placed third 'phone in the 12th AP. In 1952 she placed third c.w.; in 1953, second 'phone; and this year she'll receive the top prize, a loving cup, from last year's winner, W1FTJ.

Top c.w. scorer in the YLRL 15th Anniversary Party is Lois Crane, W4YYJ, shown at her OM's operating position.

**QST for**

All-ham families are so manifold nowadays that they are no longer a novelty. But when father, mother, son, and daughter all have ham tickets, interfamily competition is keen. Nevertheless, the sense of satisfaction and pride that the family experiences is strong. So it is, at least, with the Wiley family of Del Paso Heights, Calif. Dad is W6GKW, mom is K6DPM, and son and daughter are K6GPD and K6DPN respectively. YL Rubie and 12-year-old daughter Lorraine took their Novice exams at the same time, and a few months later passed their General Class exams.

YL contest winning fever is catching, at least in the Crane family of Birmingham, Ala. C.w. section winner W4YYJ will place her cup (received from last year's winner W4RLG) alongside that of her OM, W4ARR, who won last year's YL-OM Contest. A family race is predicted, for a cup must be won three times in order to obtain permanent possession.

Top 'phone scorers by districts: W1VOS 11,542.5, K2IWO 11,857.5, W3MAX 22,320, W4YYJ 16,582.5, W5SPV 3885, W6QGX 7455, W7YWM 15,400, W8HWN 17,100, W9AQB 10,920, W9OMM 11,962, VE3AJR 5400. Certificates have been awarded to each.

Other 'phone scores: W1MCW 6580, W1QON 1072.5, W1RLQ 2700, W1RYJ 367.5, W1UZR 1815, W1WPX 5445, K2DSL 675, W2EEO 1040, W3TYC 607.5, W4s BLR 420, CWV 1137.5, HLF 15,840, KYI 13,125, RIG 10,335, SGD, 6250; W5s RYX 3697.5, RJZ 1275, TTU 125, WUX 1620, WXY 50; K6ANG 900; W6s CEE 1590, EHA 1861.25, GQZ 1200, KER 375, PCA 1155, QOG 4600, QYL 60, UHA 2400, WRT 858; W7s HHH 1250, OOO 6660, RVM 5160, SNP 1755, TGG 5940, ULK 7837.5, VYG 1620; W8s ATB 2600, DNF 1920, HUX 4320; W9LOY 3375; W9s BFW 6037.5, ERR 2625, FVE 3277, JMJ 1260, MRJ 495, ZWL 675. Top c.w. scorers by districts: W1FTJ 6375, K2DXD 1218.75, W3QPJ 3656.25, W4HLF 6375, W5WXY 240, W6PCA 1487.5, W7SYF 187.5, W8HWN 4250, W9FVE 2600, VE3AJR 5040, VE5DZ 605. Certificates have been awarded to each.

Other c.w. scores: W1s RLQ 1625, VOS 1125, WPX 5362.5, YNI 438, YYM 2187.5; K2s CUQ 500, IWO 120; W3s CDQ 45, MAX 1100, TYC 2450; W4s BLR 1340, RIG 2250, YYJ 6612.5; W6EYA 481.25, W7VYJ 156.25; W6EHA 600; VE3DDA 403.

Thanks to W6KER, Gilda Shoblo, YLRL vice president, for tabulating and recording contest scores.

### QST an International Passport

During a recent trip to Spain, W2YCX, Carolyn (Carlie) Hull, found that her photograph which appeared in *QST* (this department, September, 1952) was her passport to a wonderful time in that country. Some of the hams she met there remembered seeing her picture and consequently accepted her as an old friend in real ham style.

Carolyn recounts:

Meeting Spanish amateurs was more fun to me than any sightseeing. One day I entered a radio store in Madrid, hoping to meet a Spanish ham. Words failed; I pulled out my QSL card. The salesman

understood and telephoned EA4BF, Alberto Kirschner. Alberto spoke fluent English and through long subscription to *QST* he knew much about ham radio in the United States. Subsequently, Alberto and his charming family invited me to a gathering of the URE or *Union de Radioaficionados Espanoles* (Union of Spanish Radio Amateurs), and I was able to learn something about amateur radio in Spain.

The URE is the only radio club in that country. EAs are handicapped by the high cost of good equipment and a dearth of components. The legal maximum power input is only 50 watts. These factors force each Spanish ham to use his ingenuity to the limit. He must be a technician as well as operator, and most EAs know their equipment inside out. By the judicious use of antennas and good operating conditions, the EA can hold his own with anyone in working DX; and despite operating difficulties, EAs are typical hams and have the true ham spirit.

There are very few Spanish YLs, and I was not only the sole YL at the meeting, but one of the first American YLs ever to visit them.

A reporter for *Revista de Radio*, the URE's amateur organ, asked me about my personal amateur activities, but no one asked me much about amateur radio in America, because so many of them read *QST*. Indeed, they know much more about us than we do about them!

### YLs You May Have Worked

As a result of local newspaper publicity about the Los Angeles Young Ladies' Radio Club, W6LBO, Mary Brandvig, publicity chairman of the club, was selected to appear

on the Groucho Marx radio and TV shows, February 16th and 17th. Mary and her program partner scored high on the quiz show but slipped on the jackpot question. Licensed in 1951, Mary finds her hilltop home at Manhattan Beach ideal for working her favorite band—two meters. She maintains regular schedules with stations up to 200 miles away. She is now serving with W9YBC as cochairman of publicity for the YLRI, First International Convention in June. Mary is the YL of W6EJL and the mother of a junior op.

## RE "LOW-IMPEDANCE TRANSMISSION LINES"

17 Random Road  
Princeton, N. J.

Technical Editor, *QST*:

Under "Technical Correspondence" (page 47) in the February, 1955, issue of *QST*, Lt. John J. Dougherty has a letter which induces me to make certain comments. While it may be true that particular antenna configurations may have influenced some people who were responsible for standardization of the characteristic impedance of transmission lines, I believe the evidence indicates that the choice was made on a much more sophisticated engineering basis. If one fixes the diameter of the outer conductor of a transmission line, it can be shown that — for air dielectric — the attenuation will be a minimum when the characteristic impedance is about 77 ohms. I believe this accounts for the nominal 75-ohm lines.

The standardization on 50-ohm lines is not as clear cut. Prior to standardization, flexible lines were made by filling 75-ohm lines with suitable dielectric material. As at present, these had a dielectric constant of the order of 2.25, which made the lines have a characteristic impedance near 50 ohms. The development of radar and the resulting high peak power further reopened the subject. For a fixed outer conductor and air-dielectric line, the breakdown voltage for a fixed input power is a maximum for a 30-ohm line. From discussions with people who were involved at the time the choice was made, it appears that 50 ohms was selected because it was already quite widely used and was a reasonable compromise between minimum attenuation and maximum power capability.

Near the close of his letter, Lt. Dougherty makes the statement that putting transmission lines in parallel reduces the transmission line losses. This is incorrect as can be shown easily using Lt. Dougherty's example. Suppose a single transmission line is properly terminated by a load and is of such a length that one half of the input power is lost in the line. Now if the load is transformed to one half the original value and two identical lines in parallel are used, the lines will be properly terminated and one half the source power will enter each line. As before, one half the power entering each line will be lost in the line. Obviously, then, each line will absorb one fourth of the source power making the total loss one half, exactly the same as in the case of the single line. The two-line system is capable of handling twice the power of the single line and a lower impedance load can be fed without additional matching means but line loss is unchanged. — *Wendell C. Morrison, W2YCE*

[EDITOR'S NOTE: Several letters have been received questioning the validity of Lt. Dougherty's statements about coaxial lines in "series" and in "parallel." The accompanying sketch may help to explain them further. It should be

obvious that the s.w.r. on the sections of lines will be 1.0 in each case, but the terminating loads are respectively twice and half the  $Z_0$  of the pieces of line.]

## MODULATION TRANSFORMERS

San Bruno, Calif.

Technical Editor, *QST*:

In plate-modulated Class C r.f. amplifier service such as we have in a.m. voice applications, there has been considerable confusion about the choice of the proper modulation transformer. As long as the transformer is big enough to handle

the power, and as long as we don't ask it to work into too high an impedance on its secondary, the only thing we have to worry about is obtaining the proper voltage transformation to make the audio and Class C tubes work correctly.

At the 100 per cent modulation level the peak value of the audio voltage out of the transformer should be just equal to the d.c. value of the plate voltage applied to the Class C stage. Similarly, at 100 per cent modulation we know that the peak value of the audio current component is also just equal to the d.c. plate current of the Class C stage. This current relation follows directly from the fact that the Class C amplifier plate circuit presents the same impedance to the audio source as it does to the d.c. power supply. That is why we calculate this impedance by dividing the d.c. plate voltage by the d.c. plate current.

Now that we know the peak audio voltage wants to be just equal to the d.c. plate voltage at 100 per cent modulation, we can start asking what the modulation transformer does. Basically, it must develop this desired output voltage when the primary of the transformer has the proper voltage present. This is the point where the audio modulator stage gets into the act. In order for the audio modulator tubes to work properly, the audio voltage built up in each plate circuit should be on the order of 70 per cent to 80 per cent of the applied d.c. plate voltage at the maximum signal level. Each half of the primary of the transformer must develop this audio peak voltage since each half has a separate tube across it.

Now if we happen to use the same d.c. plate voltage on the modulator (or audio amplifier) as we do on the Class C r.f. stage, the peak audio voltage at 100 per cent modulation which is developed in each half of the primary of the transformer is 70 per cent to 80 per cent of the d.c. plate voltage involved, and of the peak audio voltage developed in the secondary of the transformer (since the latter is equal to the d.c. plate voltage). This says that the number of turns in one-half the primary of the transformer must be 70 per cent to 80 per cent of the number of turns in the secondary. The number of turns in the full primary of the transformer is twice this, or 140 per cent to 160 per cent of the number of turns in the secondary. This is often stated as a primary to secondary turns ratio of 1.4 or 1.6 to one. Thus the modulation transformer is fully specified provided it is big enough to handle the power.

Note that the modulation transformer was chosen without mentioning the value of d.c. plate current drawn by the Class C stage, or the amount of plate current drawn by the audio amplifier. Also note that nothing was said about the exact impedance placed on the secondary of the transformer or about the impedance which must be presented to the audio amplifier. The fact that the current drawn by the amplifier and the load impedance are not involved in the choice of the modulation transformer is demonstrated daily in the operation of Class C amplifiers. Once a proper modulation transformer has been chosen we change the load on our Class C amplifier freely without in any way disturbing our ability to modulate well and with good quality.

The impedance presented to the secondary of the modulation transformer (or the voltage to current ratio) is dependent upon and will vary with the amount of d.c. plate current drawn by the Class C stage. Because the transformer transforms this impedance to the primary side by the square of the turns ratio, the primary impedance will also vary. It should be noted, however, that the voltage transformation is not upset by the way in which we vary the loading on the secondary of the transformer. This is the familiar behavior of 60-cycle power transformers.

For audio amplifiers used as modulators we don't have to concern ourselves about the particular value of load impedance which is listed on the tube data sheet. As long as the tubes are capable of supplying the desired output power, and as long as the modulation transformer has the right voltage ratio, the tubes will work efficiently and satisfactorily. As indicated above, an audio modulator works efficiently when the peak audio voltage in its plate circuit is some 70 per cent to 80 per cent of the d.c. plate voltage at maximum signal. In Class AB<sub>1</sub> modulators the peak audio voltage is somewhat smaller and may be nearer a 60 per cent figure. — *W. G. Wagener, W6VQD*

# 1955 V.H.F. Sweepstakes

## 8th Annual Winter Contest Activity at All-Time High

**I**N 1951, the low point in the history of the Annual V.H.F. Sweepstakes, 299 logs were sent in. Since then, the curve has shown a constant upswing: 365 in 1952, 385 in 1953, 610 in 1954. In the 8th running, January 8 and 9, 1955, the total climbed to 747, and this does not include a handful received after the mailing deadline. In just about any other category you can name, the 1955 V.H.F. SS was also a record-breaker.

Significantly, this came about under strictly normal conditions. Not a contestant reported any real break from conditions, yet in the more densely populated areas the contest ran hot right up through the last minute before midnight Sunday. Where heretofore more than 200 contacts by any one contestant has been a distinct rarity, no less than 15 made or exceeded the 200 mark this year, and quite a few of them turned the trick with just one band, 2 meters. W3IBH was the country's top man from the standpoint of contacts on one band, with 245 on 144 Mc., but it took W2UK's unheard-of section multiplier of 18 to post the country's top score. Tommy worked 176 stations for 6336 points, far exceeding the record of 4104 set by W2SAI, way back in 1950. And W2UK made them all on 144 Mc., and with the band dead! K2CMB's 248 contacts on 144 and 220 was the top in QSOs on more than one band.

How far the 1955 contest exceeded previous marks can be seen from the fact that nine contestants broke the old W2SAI record. As might be expected, most of these were in that hotbed of v.h.f. activity, the stretch of heavily-populated country between New York and Philadelphia, but not all the big scores were made there, by any means. W1UIZ/1, who had the temerity to take to the site used so successfully in past warm-weather contests by W1MHL/1 (Pack Monadnock Mountain, near Peterboro, N. H.) made 216 contacts in 13 sections, for 5603 points, and the No. 3 spot nationally. W1RFU, who *lives* on his mountain, in Wilbraham, Mass., landed in No. 2, with 218 contacts in 13 sections, for 5668. W6WSQ showed what can be done from the Los Angeles area, with 210 contacts on 144 Mc. alone. The lower section multipliers that prevail outside the small-section East kept his score out of the top ten, but his 2100 points belongs right up there with the best of them. The same goes for W8SVI, Fairborn, Ohio, who led all the inlanders with 146 contacts in 7 sections, for 2044 points.

Novices and Technicians were out in force, and there were 15 certificate winners in the newcomer categories. Novices won over-all section awards in Eastern New York and Indiana, and KN6GMV must have set some kind of

Novice record with 163 contacts on 2 meters in the Los Angeles Section.

Unlike the spring and fall contests, the SS doesn't give extra credit for use of higher bands than 144 Mc., but 31 contestants worked on 220 Mc. and 14 used 420. W6MMU managed several contacts on 1215, and W7JIP and W7OKV put their 10,000-Mc. gear to work for the party. W7ANS says that the first 220-Mc. work in the Seattle area came off during the contest.

It's the club incentive that makes the V.H.F. Sweepstakes what it is, the fourth-ranking ARRL operating activity, and the club activity was terrific in this year's event. It was a contest between two Philadelphia-area clubs, as often before, but combinations from other areas are gaining ground on the perennial leaders. The South Jersey Radio Association won another gavel award, with the first aggregate of more than 50,000 points in the history of V.H.F. SS competition, leaving their rivals, the York Road Radio

### CLUB SCORES

\* Three-way tie

The following clubs were also mentioned on less than three valid entries: Aero ARC, Albany ARC, Alma College RC, ARC of Falls Church, Capitol City RC, Chesapeake ARC, DuPage RC, Electric City ARC, Hamden ARA, Hamilton ARC, Kalamazoo ARC, Lake Washington ARC, Lower Columbia ARC, Mid-Island RC, Milford ARC, Milwaukee AREC, Nortown ARC, Ohio Valley ARA, Palo Alto ARA, Portland ARC, Providence RA, Quannapowitt RA, RA of Western New York, RA Open House RC, Sandusky Valley ARC, San Mateo County ARC, Santa Clara County ARA, Staten Island ARA, Steel City ARC, Tri-County RA, Tulsa ARC, Yale ARC, York ARC.

Club, far behind. The fierce competition (a private matter) between the Hampden and Hartford County clubs, "brought out the vote" in the Connecticut Valley, with the Hartford County Amateur Radio Association pulling up a good third in the country. Dayton turned out in force, but lost ground to 5th place from their No. 3 spot of last year.

In the following tabulation, scores are listed by ARRL divisions and sections. Unless otherwise noted, the top scorer in each section receives a certificate award. The highest-scoring Novice and Technician licensee also receives a certificate in each section where at least three such licensees submitted valid contest logs, asterisks denote these winners. Columns indicate the final score, the number of contacts, the section multiplier, and the bands used. A represents 50 Mc., B 144 Mc., C 220 Mc., D 420 Mc. and E 1215 Mc. and above. Multiple-operator stations, with calls of participating operators, are shown at the end of each section tabulation.

Nearing the top of Pack Monadnock, near Peterboro, N. H., after 4½ hours of pushing, shoveling, and replacing worn-out cross-links. About to make last chain repair is WLUZ, operator. Onlookers are Butler, Meade and Finan, the last a New Hampshire State fire warden. Fifth member of the expedition was the photographer, W1WID. A total of 216 contacts on 50 and 141 Mc., in 13 sections, netted 5603 points, third highest in the country.

# The World Above 50 Mc.

CONDUCTED BY EDWARD P. TILTON, W1HDQ

Is that new beam up? Rig free of bugs? Converter in apple-pie order? Better get set, for there's a big season coming up. The more than 750 logs received following the 8th V.H.F. Sweepstakes show that activity is developing as never before. Auroral DX in January was the best in years. There were fine tropospheric openings in February. Winter sporadic-E was more widespread and it lasted longer than in any corresponding period for at least five years. Yes, all the signs are pointing to a spring DX season you won't want to miss. It should be breaking out most any time, now. Will you be ready for it?

The activity picture on 144 Mc. and higher bands is bright, indeed, but we could use several hundred new stations on 50 Mc. There were too few 6-meter men on hand to make the winter sporadic-E openings show to good advantage. The winter period is usually over shortly after New Year's Day, but widespread openings were reported through the end of January, and into February in 1955. On January 29th, for instance, W6BWG, San Gabriel, Calif., found the band open at 1555 PST, and was able to work W7DYD, Bothell, Wash., W5MJD, Amarillo, Texas, W0CNM and W0FKY, Grand Junction, Colo., W5KWP, Santa Fe, N. Mex., and W5SIN, Pampa, Texas, in 4½ hours. W5FXX, Austin, Texas, reports an S9-plus signal from W7QNO, Phoenix, Ariz., who was running only 3 watts, and using a 2-element array.

TV DX enthusiasts all over the country had a four-day DX binge beginning the 29th. If sporadic-E DX shows on Channels 2 through 6, 50 Mc. is open over the same, or slightly shorter,

paths. The hundreds of TV DX hounds have shown us one thing for sure: There is a lot more sporadic-E DX than 6-meter men have ever realized, even in the heyday of activity on the band some years back.

Newcomers may not realize how much fun 50-Mc. sporadic-E DX can be, nor have much of an idea of when and how it can be worked. As a result, we find nearly all the new v.h.f. activity on 144 Mc. and higher frequencies, with 50 Mc. getting very little play from the new recruits. So, for them, we pass along a little dope on 6-meter possibilities. If you're an old hand at the 6-meter game, skip over to the fine print; there'll be nothing in the next few paragraphs that will be news to you.

By the time this appears in print, there will be just about time for you to get 6-meter gear going, and an antenna up, before the spring DX season gets under way in earnest. Usually the best months are May, June and July, but we've had some good openings as early as the latter part of March, and we can remember hearing West Coast stations in the latter part of April some years ago. The best signals are usually heard at distances of 600 to 1200 miles, but at the peak of the season (June and July) the skip may get as short as 300 miles, or even less. Multiple-hop propagation brings in stations at greater distances, too, making 50-Mc. WAS a definite possibility, from any point in the country.

DX of this sort shows most frequently in the early evening hours, and thus quite a few chances are missed by fellows who tend to operate only late at night. The morning hours are also good,

V.H.F. Sweepstakes expedition up to Capitol Peak, near Olympia, Wash., by members of the Capitol City Radio Club. The sled is loaded with a 1500-watt generator, gas cans, food, blankets, a 6-element beam and two Communicators. Hikers include W7s POP RKS PVZ, W7N7s WGG VXR YCN and two others whose calls are on the way.

with midafternoon generally a low point. At the start of the season, openings are frequently short and widely scattered, affecting only small areas at any one time, but from late May through July, sessions may last for several hours, and bring in just about every section of the country. Look for skip to open to the east first, then swing around to north-south, with finally to the west before a good opening dies out. We recall comparing notes one morning after a tremendous June splurge, to find that among three of us who had been on the night before, 37 different states had been heard or worked!

The beauty of it all is that it doesn't take high power or large antennas to work the skip when conditions are good. S9-plus reports are common with just a few watts, though of course the high-power man is able to get in a little sooner, and stay a bit longer, than his flea-powered brother. Ten-watt mobiles with quarter-wave whips can work the DX, and the folded-dipole operator is likely to do almost as well as the big-beam man, when things are at their best. Of the 10 hams who have qualified for the special 50-Mc. WAS award offered by ARRL, not one used a kilowatt rig. They did have perseverance, however, and some knowledge of when and where to look for their quarry.

Probably all of them would agree that, in mak-

ing those 48 contacts, and hundreds of others before and since, they had as much fun as in anything they've ever done in ham radio. Chances are you'll feel the same way about 6 when you've given it a whirl. There will never be a better time to get started than right now!

## Here and There on the V.H.F. Bands

Not all the tropospheric DX is worked in the summer or early fall. The weatherman cooked up a coastal inversion along the Atlantic Seaboard on the night of Feb. 21st that was almost equal to the best that September could produce. It was made to seem all the more exceptional by the presence on 144 Mc. of W1DEO, Cape Elizabeth, Maine, who gave 2-meter men their first contacts with that hard-to-get state for hours on end.

Maine has probably been the most difficult of the New England states for operators down the coast in W2, 3 and 4. It is farthest away, and there has been little consistent activity, with horizontal polarization, and the necessary power, receiver sensitivity and antenna gain to do the job at that distance. If W1DEO keeps up at his present pace, there should be some considerable change in the states-worked standings before long. His best DX on the 21st was W4AO, Falls Church, Va., about 500 miles. This was No. 23 for W4AO.

There's life in the 6-meter band. W0HYV, Pleasant Hill, Mo., managed to work 31 states during 1954, and he heard three others, including Nebraska, which is one of two he needs for 50-Mc. WAS. Gib says that W0s PYK TOQ CKQ and QXT will be on 6 this summer, to help him keep Missouri on the 6-meter map.

Southern New Jersey lost one of its most active v.h.f. stations, and the 420-Mc. band one of its strongest boosters, when W2QED, Seabrook, N. J., closed down for good in February. Ken had been active on 50, 144, 220 and 420 Mc. for more than two years, and had been a potent factor in the 420-Mc. picture along the Atlantic Seaboard for years before that. He was colider, with W8BFQ, of the 420-Mc. record, 360 miles, for a short time in the summer of 1953, and it was through his efforts that the eastern end of the record was passed on to the next holder.

W2QED never missed a v.h.f. contest, and he kept regular morning and evening schedules with scores of stations, and on several bands. One of these was an all-time record for your conductor, a morning check on 144 (and occasionally up to three other bands) daily, that ran for nearly four years, and close to 1000 contacts.

Stations for hundreds of miles in all directions from Seabrook, N. J., will miss W2QED. But the East's loss is the West's gain, for we understand that Ken is bound for the Los Angeles area, where he will find plenty of opportunity to continue his fine work in the world above 50 Mc.

Two other famous stations are reported to be on the verge of dismantling for major moves. W2UK will be closing down in a few months, and W8BFQ-WJC is reported to be moving southward. It will take a lot of operating and antenna work to fill the gaps left in the v.h.f. bands by the departure of these stalwarts!

Another well-known call about to be heard in a new locality is VE3ANY. Gordon has taken up permanent residence in the Detroit area, and will soon be heard on the v.h.f. bands operating under his old call with a reciprocal permit from FCC.

V.h.f. operators of the Houston area have formed the 144 and Up Club, for the purpose of promoting activity and interest in v.h.f. work. This grew out of a V.H.F. Round-up held last fall. Quarterly contests are planned, the first to begin April 1st. The next meeting of the group is planned for the West Gulf Division ARRL Convention, to be held in Ft. Worth, June 10th to 12th.

We have notes from several groups and individuals this month who make the same plea: "Please let the gang know that we are on the air here, and ask them to turn their beams in our direction once in a while." K4AMX, Winston-Salem, N. C. (formerly W1ACG, Lexington, Mass.), says that he works W4NHW in Greensboro and W4CVQ, Raleigh, N. C., almost nightly, but would like to hear from other stations to the north, west and south. The Winston-Salem C.D. Net operates on 147.15 Mc. each Tuesday and Thursday night at 2000 with W4CPI as control station.

VE6HY writes on behalf of the Calgary Amateur Radio Association that there are about 15 stations on 147.6 Mc. in that area. They would like to hear from W7s who may be within operating range.

The Davidson County (middle Tennessee) 2-Meter Net meets Monday and Thursday at 1930 CST, with W4OEZ, Nashville, as NCS. Alternate is W1TFU. Average number checking in is about 10. Vertical polarization is used in net activities.

K6GKX, Long Beach, Calif., writes that Thursday and Friday nights are set aside for round-tables on 220 and 420 Mc. Use of both bands is on the increase, with W6s SSB ZW OCU and NIT, particularly, deserving credit for their efforts in popularizing these bands.

Anyone for 220 Mc. around Williamsburg, Va.? W8LTF/4 has been operating on 220.1 Mc. with a converted ARC-5, but has found nobody to talk to as yet. A 4X150A with changeable tank circuits for 220 and 420 is in the works.

Have you heard any single sideband on 144 Mc.? Elsewhere we report that W7JRG has finally given up on s.s.b. on 50 Mc., because so few fellows recognize it when 6 is open, but W2JJC, New Market, N. J., has been doing quite well with s.s.b. on 144 Mc. His power level is now about 100 watts output, from a pair of 826s, running in the AB2 region. W2JJC's best DX so far is W1RFU, and very nice reports are being received from distances up to 100 miles or so in other directions. As almost everyone uses a crystal-controlled converter on 144 Mc., there is no stability problem in receiving the 2-meter s.s.b., and quite a few listeners have reported the readability holding up remarkably well under conditions when a.m. signals are fading into the noise. A few checks your conductor has made with W2JJC indicate that the readability is considerably better than a.m. of comparable power level. Watch for W2JJC on 144.39 Mc.

Should there be an exclusive c.w. assignment in the 144-Mc. band? Quite a few fellows think so, and at least one has petitioned FCC to set aside a segment at the low edge of the band for c.w. operation only. There are several good arguments in favor of such a move, and probably few against it, though talk of such things invariably stirs up a hornet's nest. With the amount of activity now heard in many areas, the QRM problem is getting fairly severe on 2, particularly at the low edge. It takes only a few strong 'phone signals to fill the first 100 or 200 kc., to the point where any DX signal is well-nigh obliterated. Proponents of the c.w. assignment idea say that moving up 100 or 200 kc. would work no hardship on any voice operator (we all have crystals for higher in the band, but we have dropped using them in most cases) but it would help to free a lot of territory for weak-signal DX operation, and make it easier for everyone.

Perhaps the alternative to legislation would be for us to do our rag-chewing above 144.2 Mc., by mutual agreement, and leave the low edge for c.w. DX work and special skeds. Anyone can QSY 200 to 500 kc., usually without any retuning. Let's do it more often, and give everyone a better break.

Remember, please, that the way to get ARRL action for or against a proposal that involves regulation changes is to work through your director, not through the Headquarters office. We'll be glad to hear opinions, but your ARRL director is the only man who can do anything about the matter. Be sure that he knows how you feel.

## Corrections, September V.H.F. Party Report

Following publication of the results of the September V.H.F. Party in January QST, we heard from several contestants whose work was improperly reported, or skipped entirely. Two Iowa logs never showed up at all, and both of them were the best that the participants had ever sent in. So, belatedly, we announce that W9GUD was top man in that section, with 78 contacts in 11 sections, for 858 points. W0EMS ran him a close second. And we did W7RT wrong in crediting him with exactly half his score. His multiplier was 4 instead of 2, bringing his total to 212, and moving him to third place in the Washington Section.

## OES Notes

W1KCS, Providence, R. I. — Antennas for 50, 144, 220 and 420 Mc. back up after heavy damage in last fall's hurricanes. Results in V.H.F. SS best on record. Note to those

needing Rhode Island QSLs: W1KCS now has stock, and will supply to all stations worked, upon receipt of QSL or note giving date of contact.

W2UTH, Victor, N. Y. — 144-Mc. signal of W1HHDQ, 260 miles, heard every Saturday morning on schedule through winter. No complete failures, though sometimes too weak for effective two-way communication.

W2UXP, Webster, N. Y. — Having fine QSOs on 220 Mc. with W2POM, W2MIH and K2CEH. Tripler-amplifier for 432 Mc., with 9903s, finished and crystal-controlled converter work along.

W3UQJ, York, Penna. — A winter of regular operation on 220 Mc. has indicated that good year-round results could be obtained on that band if more stations were using it. Coverage seems to be comparable to that generally obtained on 144 Mc. Even very low power does well if a good antenna system is used. Schedules have been kept regularly with W4UMF, Arlington, Va., over 80 miles of irregular terrain, using only 8 watts.

(Continued on page 142)

# Simulated Emergency Test—1954 Model

*Genuine Emergencies Compete with Emergency-Preparedness Plans  
To Make the 1954 SET Realistic*

BY GEORGE HART, WINJM

THE SET had a lot of competition this year, especially in the East. Those AREC groups who were not girding for the next hurricane were recovering from the last one. In Indiana, a tornado or two wiped out a couple of towns and all SET plans with it. In other places also, Old Dame Nature cooperated pretty well with us, this year, to take the "simulated" out of SET, and put the gang to the real test.

Many of the AREC organizations so afflicted simply did not feel like putting on an SET on top of all their other labors in connection with the real emergency, and we don't blame them. Others submitted the regular SET form, but crossed out the word "simulated" and reported their operation in the real emergency. After giving the matter some thought, we have decided that those who did this should certainly receive credit for participating in the SET. After all, what can be better practice for operating in an emergency than operating in an emergency?

All this hullabaloo, of course, put a crimp in our over-all SET participation. Of our 1700-odd ECs, 142 reported participation in the SET. Fifty-eight of these chose to conduct their SETs at dates other than the October 9th-10th week end, ranging from October 3, 1954, to February 22, 1955. Several ECs indicated that no SET was held because they felt it unnecessary in view of regular drills in their emergency program.

Twenty-nine groups bettered their 1953 score,

and twenty-four fell short. This makes 53 who had an SET in 1953 who repeated the process in 1954, leaving 89 new reporting groups. This about follows the pattern of previous years participation of repeaters and new groups in the SET.

Traffic on the long-haul circuits was light, due to the decrease in participation and the increasing tendency of AREC groups to take advantage of the latitude in dates. Seventy-seven ECs reported their SET participation, or lack of it, by radio. All but one of these were received at Headquarters by radio.

The Test Emergency Alert, an innovation in our annual SET, went over "like a lead balloon." The transmission was made from W1AW only, by 'phone at 2030 EST on October 9th, on four National Calling and Emergency 'phone frequencies (3875, 7250, 14,225, 21,400 kc.) and at 2100 EST by c.w. at 18 w.p.m. on four NCE c.w. frequencies (3550, 7100, 14,050, 21,050 kc.). Sixteen amateurs reported reception of the message. Six of them sent in 100% correct copies after having confirmed reception by radio as instructed in the TEA message itself. The winners: W1BDI, W1CRW, W4BAQ, W4YZE, W8CCN, W0N1Y. Three amateurs sent messages confirming reception, but the mail copies turned out to be incomplete: W4COY, W8AQ, VE2HD. W4ERK's copy, by mail only, was also imperfect. The following confirmed reception by radio but did not send in copy: W1CWX, W1LKP, W1-

This is the communications control center for the city of St. Lambert, Que., as it was operated during the SET. It is operated under the call VE2ADN, of the South Shore Amateur Radio Club. There are four amateurs in the picture: EC VE2KG (standing) and seated, starting from the left, VE2TE, VE2CA and VE2NY.

QMB, W4BUA, W4CZR, W4WXZ. We thank all for participating in this test: you all rate honorable mention and an E for Effort even if you didn't copy 100%. Many of those who copied the TEA did so only because they left receivers tuned to one or the other of the NCE frequencies all the time, to be sure not to miss it. Many others reported monitoring for hours at a time without success.

Maybe we're just obstinate, but we still think the TEA is a worth-while part of the SET. What do you think? At the moment, we're planning to try it again in 1955, but we can be talked out of it.

Here's the annual breakdown of the SET by participating groups: Figures in parentheses are comparative figures from last year:

<i>Total reports of activity:</i>	142 (180)
<i>AREC members in areas reported:</i>	3635 (5531)
<i>Total known participation:</i>	2252 (2522)
<i>Mobiles &amp; portables:</i>	999 (1149)
<i>Fixed stations on emerg. power —</i>	164 (200)
<i>Messages from participants to ECs —</i>	1365 (1841)
<i>EC radio reports to ARRL:</i>	77 (116)
<i>Total points:</i>	18,369

The Amesbury, Mass., control station was set up at the School Street Fire Station. That's W1RYJ at the mike, with W1ZFZ on her right and EC W1ICU on her left. Standing, l. to r., are W1DON and W1UHL.

# How's DX?

CONDUCTED BY ROD NEWKIRK,\* W9BRD/9

## How:

We came to the end of the business portion of our first post-DX Test club meeting and the boys sat back for the usual informal finale of our monthly get-together. Inasmuch as two of our gang were being evicted by their landlords, tonight's discussion appropriately was titled "How to Select a DX QTH."

Chairman Bandsread McSwindle, who has 715 feet of 20 meters on the dial of his homebrew superhet, first called upon Cunningham Plotch, our most recently established 200-country man. Cunningham's explanation for his shack's location was disappointing: "Shucks, the XYL liked all the closet space."

McSwindle then tackled Skeds Stamplicker, a guy who earned his DXCC the hard way with 12.3 watts input and a scratchy receiver volume control. Skeds' reply didn't bring the house down, either: "Gee, the best pizzeria in town is right across the street and they don't deliver."

Next came the uninspiring lowdown on why Bugbeater Butterby has a shack on the top floor of a bowling alley: "Won a suit against the place for bruises suffered while working as a pinboy." Also how come Svishy Svensen keeps his station in the back of his fish store: "The tuna vat makes a good ground for an 80-meter vertical." (A paradox becoming evident was that all these birds with crummy QTHs were the most active and eager DX men in the club!)

Well, we all began to realize that we were getting nowhere speedily. The discussion was turning out to be as constructive as a rubber crutch. But just as disgusted Chairman McSwindle was about to adjourn the session and forget the whole thing, in walked Acres O'Green, late to another meeting as usual.

Now everybody knew that Achy had the best DX QTH in the club. Brother, *what* a spot. And, sure enough, when Bandsread asked him about it Acres described in glorious detail how he went about selecting such a marvelous location. He had called in seven communications engineers who took noise and f.s. readings all over the place. The ground conductivity was investigated by three other specialists. Surveyors checked the elevation and general topography for miles in every direction. Acres left nothing to chance and no propagational pebble remained unturned.

After several months of such monkey business Acres built a bungalow on the stake and installed a classy shack. All his pains were worth the effort — man, did that boy *get out*. Any old time Achy tapped his key or whispered into his mike

the ZC3s and VQ9s came back on their hands and knees.

O'Green concluded his lecture with the orthodox "Any questions?" and somebody up front came through with the natural one: "Say, Achy, tell us how many multipliers you piled up in the Test, huh?" Our guest of honor by default scratched his chin, thought a moment, then looked uncomfortable.

"Well, fellows — ah-h — decided to do a little rebuilding, you know. That was in 1952, come to think of it. Then somebody loaned me a couple of LP records and I kinda got hopped up on hi-fi. Haven't gotten around to finishing up the rig. And that reminds me — I've just come from my monthly meeting of the Beehop Lovers of East Podunk. I'm president, you know, and the club wanted me to tell you birds to get your darned harmonics the heck off WOOF-FM on Sunday afternoons. . . ."

Bandsread McSwindle himself led the sturdy little band that picked up Acres O'Green, handed him his Homburg and neatly heaved him out the door.

## What:

But, as McSwindle observed on the way home from that meeting, O'Green will be back. They *always* come back. And sure enough, Achy could be heard going after ZDSAA and PJ2MA on 20 and 40 with his exciter the following night.

Some of the vast treasure hoard on Cocos Island was freely ladled out by T19MHB beginning early in February. Not material wealth, that is, but QSOs by the thousands, contacts with one of the rarest entities on the ARRL DXCC Countries List. W6MHB officiated in this charity, ably assisted by a Viking rig, NC-183 and HQ-120 receivers, and a few bulky spools of hard-drawn copper. T19MHB aimed

\* New Mailing Address: Effective immediately, please mail all reports of DX activity to DX Editor Newkirk's new address: 4128 North Tripp Ave., Chicago 41, Illinois.

for 10,000 A1 and A3 QSOs on 10 through 160 meters and was operated in ideal maximum-contacts-per-hour fashion. Whether or not the hunt for cached doubloons and pieces of eight pays off, the hamming aspect of this venture stands an unqualified success.

Twenty 'phone, now, if you please. **CR7CF** 20-21, **ET2US** (183) 17-18, **HZ2AEH** 17, **TF5SV** (114) 15-22, **VPs** 2KM (197) 17, **8AQ** (100) 23-0, **VQ8AR** (150) 14-20 and **YI2AM** (145) 12-14 leveled **W4CBQ** off at 108. . . . . Twenty c.w. emerged from the annual ARRL DX Test battered but unbowed. **CR5s** AF JB (78) 20, **DUs** 1CV (65), **7SV** (27) 0, **FG7XB** (28), **SV0WL** (90) 13, **UB5KBE** (60) 14, **VS2CR** (42) 14-15 and **VE2EJ** (50) swapped notes with **W8EV**. . . . . **DL4ZC** collected **FB8BR** (50-100) 16-18, **VQ3CF** 15, **YV5DE** 15 and **ZS9I** 19. . . . . Choice plums **CT3AB** (35) 9-20, **DUI1DR** 15, **EL2s** P (47) 15-19, **X** 19, **FF8AJ**, **FP8AP** (25-73) 13, **FQ8AX**, **FR7ZA** (18) 16, **HRIAT** 19, **KC6CG** (52) 17, **MDs** 5FA 7AB 17, **VP7MI** 20, **VQ5EK** (30) 14-19, **VSs** 1FE 1GK 2EG 15, **VU2s** CP JP (80) 15-16, **YS1O** 17-18 and **ZD4BQ** (78) 18-21 are among **ZD6BX's** harvest. . . . . **W2HSZ**, confidant of

Count U. R. Kunties, did well with **CRs** 4AL 6AI (59) 21, **6CJ** (11) 19, **7LU**, **FF8BF**, **FM7WMI**, **FQ8AG**, **OQ5HI**, **OX3UD**, **TF3BM**, **VQs** 2AS (72) 19, **2JN** 4FG, **YNI**PM, **ZD4BM** (80) 18, **ZE3JL** (35) 19-20 and **ZS3AH** to reach postwar 154. . . . . **FB8BE** (61), **KW6BB** (104), **LB1LF** (21), **ST2GB** (10-76) 20, **VQ3s** FN (54-68) 20, **JTW** (23) and **ZS7D** (7-28) 19 worked **W9TGY** to 138/110. . . . . It's 121/107 at **W9UKG** thanks to **EL2C** (80) 22, **ET3S** (84) 20, **FY7YE** (35) 13, **HA5KBA** (64) 17, **SP3PK** (20) 15 and a **ZD4**. **OY4XX** (20) 17 got away. . . . . **W9AMM** did a grab on **EL9A**, **Togoland's** **FD8AA** (10-94) 14-17, **KAs** 2USA 9MF, **JAs** 3AF 3FG 6AD 8AQ, **OQ5CP** (50) 21, **SP2KAC**, **SV0WO** and **ZB2A** (40) 18-19. . . . . **E9AP** (19) 16-19, **IT1TAI** (70) 19, **OD5AV** (30) 5, **OX3SL** (60) 17, **VQ4FK** (5) 19, **YI2AM** (60-80) 15-21, **ZB1JRM** (7) 20-21, **9S4AX** (2-12) 15-19 and others fell prey to **W4TFB**. . . . . **W4ZAE's** new cube quad will have trouble improving on **CR6CZ** (30) 21, **FF8BB** (21-68) 19, **FM7WP** (14-22) 15, **KR6KS** (15), **VP2GW** and **ZE6JB**. . . . . **W4JBQ** caught **EAs** 6AF of Balearics, **9DF**, **OQ5GU** (9) 23, **YO4CR**, **ZE3JO** and a **ZS7** for a 112/88 total. . . . . At **K6ENX** we find **OA4ED** (15) 1, **PJ2AD** (50), **TF3KG** (30-70) 19-21, **VP8BF** (60) 1 and **V56CR** (30) 1. . . . . **EAs** 8C BF (40) 21-22, **GC2CNC**, **HP1BR**, **OY2Z** (55), **SP3PK**, **TF5SV** (40) 22, **VQ2HR** (29) 10 and **ZB2I** (10-30) 19-21 brought **W3UXX** past the century. . . . . **15LV** (95) 20, **VQ8AY** (58) 18 and **ZD6EF** (55) 19 looked mighty good to **W4EPA**. . . . . **CR7CN** (10-69) 21, **ET3GB** (10-55) 18, **KA2USA**, **OY2A** 5-75 16, **SV1AB** (60) 19, **VQ2W** (50) 20, **YO3RF** (61) 17 and **ZB1CH** (67) 22 were booked by **KB2TZ**. . . . . **W5VIR** worked **FF8CG** (40) 23-0, **JA3BB**, **KM6AN** (15) 21-0, **VP8s** AQ (80) 0-2 and **BD** (40) 2-13; heard **CPs** 3CA (29), **5EK** (88), **HK1TH** (39), **HZ1AB** (88), **IS1CXF**, **LZ1KPZ** (88), **MB9BJ** (90), **OD5s** AX LC (30), **ZB1KQ** and **4X4BN** (54) as **W5VIR/2**. . . . . **CRs** 6CZ (38) 21, **7AN** (17) 20, an **EAG**, **F9YP/FC** (60) 19 and **ZD6BX** (50) 19 answered **W1WAI**. . . . . Climbing to 108, **W1OJR** settled on many of the aforementioned as well as **CR6CW** (18) 21, **EABBK** (15) 17, **EL5B** (37) 20, **ET2PA** (55) 18, **FA9VE** (65) 18, **11BLF/Trieste** (55) 17, **SP8KAF** (25) 16, **VQ4BNU** (18) 19, **YOSCF** (52) 13, **ZC4RX** (30) 17, **ZS3s** B (50) 21, **K** (32) 18, **3V8AN** (45) 13 and **5A4TX** (7) 17. Vic notes that former neighbor and ardent DX man **W1RY** now signs **W8RQ** as a Michigander. . . . . Log-snooping hither and yon, at **W1PWK**: **FG7**, **FM7s**, **VP7NX**, **W2GVZ**: **FB8**, Jan Mayen, **MP4QAJ** (58), a **ZD7**, **W2OLU**: **FY7**, **VE8s**, **VP6RG**, **ZB1**, **W2QBB**: **EAs**, **HC1LE** (60) 22, **W2ZGB**: **ET3**, **KJ6AZ** (110) 22-23, **KW6**, **ZD4**, **W3AXT**: **F9QV/FC**, **VQ6LQ**, **ZE5JA**, **W4EPA**: **ET3LF** (20-50) 17-20, **ZD4**, **ZS3E** (95) 21, **W6OWD/1**: **HB9QQ/MM** (25) 19, **KV4AA** (90) 12, **W6LRU**: **VR3A** (35) 17, **K6AAW**: **FQ8AB** (20) 2, **JAs** 1 through 8, **VP4LZ** (10) 23-0, **W7EWR**: oodles of **KAs**, **CX2AM** 3, **PJ2AJ**, **W3DLZ**: **CR6AR** (12), **TF5**, **ZD4**, **W0VFM**: **SP9**, **TF3**, **YV5FV** (88) 22, **F7ER**: heard **AP2Q** (18) 12, **VQ6U**: **VP1AA** (1) 23, **ZC4JA** 13. . . . . **WGDXC** 20-meter A1 goodies: **CE7AA** (52) 3, **CR6Cs** 60 (18, **EAs** 8AX (42) 14, **0AC** (10) 21-23, **FE8AE**, **FF8AP** (62) 21-22, **FL8AI**, **FM7WQ** (35) 0, **FQ8AM** (70) 3-4, **GC2FZC** (50) 19, **HB1MX/HE** (63) 14, **K6GGX** (83) 2, **KTIWX** (80) 18-19, **LUs** 1ZG (15) 2, **6ZT** (35) 22, **MIL** (58) 16, **MP4BBB** (79) 14-15, **OD5AI** (62) 15, **OQ5BQ** (49) 22, **SP3AN** (80) 14, **VPs** 3VN (90) 19, **8AX** (72) 0-1, **VQs** 2AB (21,

**FP8AK/VP2**, operated by **W2BBK** on Tortola, Leewards, B. W. I., from February 2nd through 4th, helped prime the gang for the appearance of **T19MHB**, Cocos, a week later. Doc and the **XYL** visited at the domicile of **VP2VA** (shown here with **W2BBK**) where the **FP8AK/VP2** Viking, S-72 and 80-meter half-wave ticked off about 150 QSOs on 80 and 40, plus a half dozen or so on 20 and 75 'phone. **W2BBK** looks forward to **DX**peditionary work from other spots and welcomes inquiries from **DXers** interested in accompanying him. Game?

The 1955 U. S. Antarctic Expedition buttoned up aboard U.S.S. *Atka* and left New Zealand for southern adventure in early January with W2ZK as the only ham included. Just before sailing, this photo was snapped of (l. to r.) W2ZK, ZL2JF, ZL2ASL, chief radiop Dehetre of *Atka* radio NMBT, ZL2ASL's jr. op, and ex-ZL2GO, father of ZL2ASL. It will be W2ZK's third Antarctic ordeal, for Bud is a veteran of the 1934-1935 and 1946-1947 Byrd explorations. He well knows what it's like to spend "three days and nights on the roof of an auto tractor in pitch darkness at 70 degrees below." We'll take a mild spring in good old U. S. A.!

2DA (0) 20, 2GW (5) 0, 4AQ (5) 20, 4RF (82) 18-19, ZDs 2DCP (42) 20-21, 3BFC (1) 23-0, ZP4ZQ (59) 22, ZS3s AB (30) 20, HX (52) 22, P (67) 19, 4X4DK (141) 15, 5As 2TZ (90) 0, 3TT (13) 13 and 4ET (40) 14. . . . . SCDXC volunteers CN2AD (60) 14, EA8AB (12) 17, FW8AB (80) 3, ISSV (45) 15, LX1AP (15) 16, MP4QAH (60) 15-16, OY2XX (22), VQ8CB 15, VS2CR (42) 14-15, YI2AM (60) 15-16 and 4SY7L (42) 7 who is rumored to have several beautiful daughters. . . . . G2RO at the keys of VL8RO (Nauru) and VQ8AY raised numerous eyebrows; so did VR2AB/A in the Tokelaus.

Forty c.w. keeps ridin' high. K6ENX (see Whence) went to town with CR9s AF (40) 15-16, AI (20) 16, DU1DR (30) 16, JZ0DN (28) 15-16 of Biak, KC6CG (25) 16, LUs 2ZI (30) 7, 7ZO (40) 7, OX3AY (20) 14, VPs 7NG (15) 2, 7NX (10) 1, 8AZ (30) 4, 8BE (25) 7, 8BH (25) 2, VSs 1FE (30) 15, 2CR (15) 16, 2EL (45) 17, 6CG (40) 14-15, 6CT (30) 17, 6DD (35) 16, YSIO (30) 3, YU3BC (20) 16, YV5DE (50) 11, ZSs 7D (20) 15, 7J (20) 15, plus cuties AI1BC (10) and KD6AT (25) 15, (AI1 is the MARS-AF prefix for Japan — what goes?) AC4NC and VK9DB escaped. . . . . EA6AF 23, HH3DL 22 with ex-VP7SL at the key, KG6FAA 13, PJ2AN (23), VPs 1AA 13, 7NM 23, OT G6UT at the key of ZS1RG 3 and 4X4FW 2 greeted W4YZC. . . . . W1WAI captured EA9s AP (9) 23, DF (21) 22, FG7XB (39) 2-3, FM7WP (17) 23, HR1JZ (20) and others. . . . . YV5DE 6, ZC6AEH 17-18, ZD6BX 19 and 4X4DE 21 gave in to DL4ZC. . . . . K6EC clashed with CE3DZ (11), CN8GB (12), a CR9, VP8s AY (37), BD (22), several VSs and ZSs. Ev's neighbor, W6KJR, contacted KC6AI (30) and KR6KS (22). . . . . CR6AI (8) 22, F9YP/FC (18) 22, GC3KAY (20) 0, HA5BT (19) 23, LZ1KAA (23) 1, SP6WF (7) 22, ZE3JP (31) 2, ZS3HX (10) 5 and 3V8HL (24) 22 were annexed by W4YHD. Jim heard UA2KAW, UB5KKA and U6KAF (34) 21 but they weren't having any. . . . . HK6AI (18) 1-2, HR1MC, LUs 4ZI 72M, TG9AZ, VR2CG (45) 18 and a ZS3 succumbed to W3AXT. . . . . FFSAK/VP2 was No. 188 for FASRJ, thanks to the good offices of W2HSZ. The latter also worked CR7CI (3) 4-5, CT2BO (30) 4-5, EA9AP, EL2X, FAs 30A9VN, GC3KGB, HC1LE, OQ5GU and myriad YUs. . . . . DU7SV, FP8AP, JAs 1AS 1CB 1KM 2LC SAE 0CG, W5GAN/KG6 and VP1AA (1) 3 QSOd W5CAY. . . . . Items at random, W4TFB: VQ4RF (15) 5, W3VIR: JA1AFF 14, KR6OY 14, TI2s BX 2, PZ 4, VP7NX, K6DVB: a DU, JA1s AA CR EU, KG6GX, W7VWS: JA3FG, with his new Viking Adventurer. VQ6U: IIBNU/Trieste 2-3, ZD6BX: JA1VE, VQ2DA, a VS2. . . . . Club 7-Mc. luck, WGDXC: FK58AZ (7) 1, FM7WD (20) 5, F08AK (80) 7, HC4MG (34) 13, HK4BF (22) 5, OQ5CP (15) 2-4, ST2AR (3) 22, UB5KAB (15) 3, ZD2DCP (5) 23, ZE3JL (30) 20 and 9S4AX (7) 21. SCDXC: CRs 4AL (1) 2-3, 5AQ (10) 1, 7AL (10) 15-16, HA5HR (12) 15, HB1LF (12) 7, KJ6FAA, LU0ZB, OUY7ML (13) 16, SP9s KAD (2) 15-16, KXS (12) 15 and SU1BR (20) 0-1.

Forty 'phone is murder but still there are hardy souls undaunted. Radio Moscow continues to simultaneously and steadily erupt on 7230, 7240, 7270 and 7290 kc. in the W/K A3 spectrum, with several other frequencies used in would-be 'phone-DX ranges below 7200 kc. NNRC reports CE3PV 10, CN8MS, CP3RC, DU9VL, EA8BC, EL2N 8, HH2s GL (167) 12, RM (165) 12, JA5 IUE 1VP 2AL 2AS 2BX 2FA 2FR 4EQ 6IZ, KJ6FAA (230) 5, TG9s, VPs in number, VK/ZLs and YN4CB as among those banging away in the A3 Test section.

Eighty c.w., however, is right in the groove. KP4KD agrees, what with CN8s BJ (25) 22, M1 (25) 22, CT2BO (10) 22-23, EL2X (5) 23, FAs 8BG (5) 7-8, 9RW (8) 7, KL7AWB (10) 7, LZ1KDP (5) 23-0, SP2BO (5) 20, YO3AR (20) 5-6, YUs 1AD (3) 23, 3IG (20) 5 and ZC4JA (15) 3. . . . . FA3TL, FY7YC, HA5KBA, HB1MX, HE, LU1ZS, OE2JG, PJ2AA, SP5FM, TI2BX, VP8BD, YUs 2BNO 3ABC 3HB 4GR, ZB1BF and ZD2DCP didn't elude W3AXT. . . . . Among W4TFB's lengthy list we spot FASDA (8) 6, KM6AX (3) 7, ZLs 1AO 1BY 1CI 3GQ 3QX 4IE and 9S4AX (5) 6. The Zedders peaked from 7 to 8 on the Greenwich clock, all near the low edge. . . . . GD3CB, YO6AL (6) 4, YU2BOP (a jazz man?) and ZB1BF (12) 4 clicked with K2BZT. . . . . More 3.5-Mc. luck here and there, at W1WAI: VP9BL, a 984, W2VVS: KM6, LU2, ZK1BG (12) 1; heard DU7SV (21) 5, UB5CF (11) 1, W4YOK: EL2, FA9, VP7NX, YV5BJ, Y4YZC: CT2, VP7, K6AAW: KL7, KM6, VQ6U: FASDA, YV5BG. . . . . SCDXC and WGDXC sources add 80-meter candidates HB1AQ HE (30) 7, JA1CR (6) 12, LZ1KAA (7) 1, SP3AK (12) 8, SU1SW (8) 15, VPs 7NM (10) 8, 8BH (8) 1, XE1OE (20) 8 and YU4AA (2) 7. Don't snicker at that XE entry — have you got a Mexico QSL on 3.5 Mc.?

Fifteen 'phone crawled out of wintry doldrums to give W9HYG a pile of ZSs, CN8CS (25) 19, CR6BH (230) 17, CX5AF (241) 22, HC1FK (224) 18, OA5G (251) 16, TI7ES (265) 19, OQ5RU (160) 19, VPs 6TR (250) 17, 5AE (214) 13, ZE2KR (130) 14 and ZL1BY (226) 15. . . . . W5VIR cornered CP5EK 22, CX1GG 17, EL2X 17, HC1s LW 22, PL 19, HP3FL 22, HR1EM 18, OA4s C 1, CC 23, PJ2s AA 21, AO 16, TI2s ACM 22, BX 23, GC 21, VPs 1GG 22, 5DX 18, 5SC 15, 8AQ 23, YN1AA 23 and YV4BV 22. . . . . DU7SV, KA9MF, KR6AF, KW6BB, OQ5GM, ZS3s AB and BC returned the compliments of W7AIX. . . . . W6NJU's new 21-Mc. rotary impaled CE3II, KG4AC, YV5EC, VKs 2AMD 4TN, ZLs 1OF 2BN 2IJ 2RC 4GC and 4HE. . . . . Observing opprobrious treatment of the U. S. 21-Mc. A3 band limits on the parts of many Test participants, W6ZZ racked up CE, DU, EL, KA2KC, KG6GX, many KH6s, KJ6AB, KL7s AOL BFP, KV4BD, LU1EQ, VP1 and VP5, VP7NX, VR2CG, ZL2LV, ZS6s ABK CV DW and ZO. . . . . 21-Mc. 'phones CN8s HVM, EA8BQ, OK1KAI, OQ5EL, ZDs 3BFC 6BX 9AC (225) 16-17 and ZC4JA are specified by NNRC, SCDXC and WGDXC organs. . . . . The latter organization denotes c.w. performance by 15-meter men FASRJ (30) 18, I1BLF/Trieste (67) 17, ZE3JL (40) 18 and ZS3K (35) 17. . . . . More code stuff from W3VIR: DU7SV (110) 23-1, FASDA 17, KA2KS 22, KG4AN 22, OQ5s GU 16, RU 20, VPs 5SC 14, 7NM 14, VQ2HR (80) 20 and YV5BX 16. . . . . FY7YC (5) and VP8BD (215) were 21-Mc. radiotelegraphers checked off by W8DLZ.

Ten 'phone appears on the verge of something or other but we had better not hold our breaths. Anyway, ZLs, other Oceanians and Africans are sneaking signals into North America at odd intervals. The NNRC boys found north-south paths open for CE2HJ, HC1KV, TI2BX (480), 3LA (480) 17, VP1AP (260) 17 and CE11Q.

One-sixty c.w. produced a good many multipliers for February and March ARRL Test contestants. Regular participants in Transatlantic Test doings found the going slow but gratifying. This assortment of DX is reported available: EI9J, G2s AJ HKU, G3s BKF BLA ERN ETP

DU6RG competes with DU6IV for honors as the most active DXer among Iloilo City's half dozen amateurs. (Photo via DUTSI)

FMZ GGN GM HDB IIQK HRW IZK JBM/A JEA JED JJZ JAIL JMS JNO JOJ JVI JVK PU, G4NS, G5s JU LQ PU RI, G6s GM HD LB, G8s PG PU QZ WF, GC3HFE, G1s 3HCG 3IOS 5UR, GMS 2BUD 3EIH 3IHP 3HRZ, HB9CM, HK4DP, HRI1W, KP4s CC DV KD, KV4AA, LU3EL, OA5G, OD5LX, OKs 1AEH 1AJB 1IHI 1KTI 2KHS 3AS 3DG 3MR, TA3AA, TI2s BX WR, VP8 4LZ 7NG 7NM, VS6s CQ CZ, YU1GM, YV5DE, ZC4s FB GF JA RX XA, ZLs 1BY 3AB and 3RB. DL1FF had no I.R. Me. rig authorization and could only listen, doing fast and furious logging. SWLs J. L. Hall, R. and W. Iball did fine reporting as did groups sparked by Ws 1BB and 3RGQ. . . . . One-sixty good fortune at this shack and that shack, at W1WY: EI Gs KP4 KV4 VP7 YV5. W1ZL: G KV4 TI VP7 YV5. W2QHH: EI KP4 OK1 TI VP7. W3E1S: G HB9 KV4 OK1 TI VP7 YV5. W3RGQ: OK1 and others. A. .... 9S4AX (QSL via W0PRM).

## Whence:

**Asia**—From HZ1AB (W6CRV): "Latest estimate of the number of QSOs by this station in the past two years is about 50,000, most of these between June of '53 and June of '54 when the station was on about 20 hours a day. About QSLs—we have ordered new ones which should be here any day. When they get here, QSL bureaus can expect batches as soon as we get them made out." HZ1AB's current schedule allows for 14-Mc. work from 1030 to 2200, 7 Mc. around 2100-0200, 3.5 Mc. (infrequently) at 0200, and 21 Mc. at about 1600, all times GMT. Ron had a pair of 750TLs and a rhombic schemed up for the DX Test .... MP4QAH confirms to W6AM that there is no legit MP4ABW. OM Mould has been scrounging around to replace gear lost in a recent shack fire. Jeeves trusts we didn't jinx Tony with those MP4QAH photos in Dec., 1954, QST. MP4QAH now owns a VS9 label for Trucial Oman operation .... W9EU notes that MP4BAM previously signed G8JX and VS1GF .... G3FQX

This clean-cut compartmental design at SM5ARL makes for facile experimentation as well as convenient operation. Frequently on duty at the SSA QSL bureau, Gunnar is DXCC with 127 ARRL Countries List items checked off postwar.

heads for Cyprus and a ZC4 label but W4SWN, stationed at Famagusta for some time now, is ineligible for a ZC4 call .... OVARA's *Ether Waves*, W4KVX editing DX, has info that G3IDC (ex-MP4BAB-VS9GT) is packing a 25-watter along on a G2RO-like DXcursion to include stops in ZC4 VS9 4S7 VS2 VS6 VS1 ZL VK and AP2 in that order. Rarer side-stops are contemplated and the jaunt should wind up around the end of this month. Frequencies to watch are 7025, 14,025, 14,090 and 21,025 kc. .... ex-XU8ROV now stalks 7-Mc. DX as W8ROV .... Club Asiatic tidbits, WGDXC: MP4BBL, who likes 14,079 kc. between 1400 and 1500 GMT, is dreaming up a beam to help him cut the 20-meter mustard. SCDXC: Ex-4S7XG's 1600 Ceylon QSOs now have been QSL'd. JASBC is one of the few JAs authorized to work the 80-meter band.

**Africa**—Additional Ethiopian info from W4KFC: ET3S has signed VE calls 3AWQ 4NS and SNY. With ET3 activity now in high gear the boys will put club station ET3TRC on several bands before long. ET3S looks for 14-Mc. A3 and A1 customers from 1700 to 2100 GMT, needing a dozen states to finish WAS. For the information

of those who prefer their ET3 QSLs direct, Ethiopia-U. S. airmail costs an equivalent 32 cents. .... W1PWK, who answered all SWL cards while operating CN8EG, tells of an instance where this policy really paid off. His first VU2 QSO and QSL came from a grateful ex-SWL to whom he had previously sent a fast reception verification .... W4EPA learned that ET3LF, who has spent the past eight years in Ethiopia, worked 65 ARRL DXCC List countries in his first 40 days on the air .... ZD6BX still seeks North American 3600-ke. QSOs around 0500 GMT. Vic exhausted his QSL supply and must rely on homebrew cards until new stock arrives. ZD6BX passed the 130-country mark with his 1955 goal set at 200 .... Club African reports, SCDXC: Fifty roaming U. S. electronics may produce some future ZD7 hamming. ZD3BFC has been scheduling G3CC on 14,104 kc. around 1700 GMT. WGDXC: ST2NW is off to VS5 climes. Lack of portable gear is all that keeps ZS5NZ from trying ZS7 ZS8 and ZS9 DXpeditioning.

**Oceania**—Writing from New Zealand just before he departed for Antarctica with this year's Byrd Expedition, W2ZK states that it is extremely doubtful that ham activities will be carried on from the frozen bases. MARS call sign A2ZK/MM was assigned to Bud for use aboard *USS Atka*. The 1955 bases will be set up in the Bay of Wales area where KC4USA operated amateur bands in 1939 and 1940 .... W2AIS, of ZC8 and KH6 renown, dropped into Hawaii for a fast visit .... W9PUH, whose favorite amateur band is 1215 Mc., writes from the Philippines that chances of U. S.-personnel licensing there appear as dim as ever. The closest approach is MARS operation at Clark AFB .... Via VK6MK, W3JNN and W1WPO we learn that ex-VK1JC's Heard Island log inadvertently was destroyed by fire. A bad break—no more VK1JC QSLs can be forthcoming .... With an assist from W6MUR, further research at the Hq. DXCC desk establishes that the islands of Fakaofo, Nukunono and Atafu should be included in the Tokelau but that Manihiki, Rakahanga, Penrhyn (Tongareva) and Pukapuka (Danger) are to be counted as among the Cook group .... Club Oceania items, WGDXC: VK9WZ closed down in favor of possible VK5WZ work. KP6AK works KH6OR and KH6SL around 0200 GMT on 14,128 or 14,245 kc. JZ0DN of Biak likes 7-Mc. hamming around 0300 GMT. VK9YT reached Ohio on his Stateside travel itinerary. SCDXC: The VK/ZL gang reports that nonamateur ham-band interference continues grim Down Under. VR6AC struggles to get out with QRP on 14,320 kc. while awaiting higher power; fellow VR6s AW and AY operate Pitcairn Radio ZBP on 8 and 12 Mc. but do no hamming.

**Europe**—U. S. military personnel currently licensed for operation in Greece include SV0WS A I J K L M N O P Q R S and T. SV0WJ is the call of the Air Attache Radio Club in Athens .... Many authorities (and we use the term flaccidly) have arisen as concerns purported Albanian hamming. One thing is certain: A ZA call sign ranks high on the list of phoney prefixes favored by Continental bootleg artists. Anyway, SP3AN told ZC4FB of his aspirations toward a ZA DXpedition this year (how

(Continued on page 134)

Meet the Famagusta Gang, half the ham population of Cyprus. Front, l. to r., ZC4s CF JJ CA and MW; rear, ZC4PB, an SWL, ZC4s LW FB and CK. These boys have fought QRM on all DX bands from 160 through 10 meters. ZC4s CA and FB are closing stations for return to the United Kingdom.

**LILLIAN M. SALTER, WIZJE, Administrative Aide**

The survey of Region I (FCDA) facilities is in progress and the Civil Defense Radio Test mentioned in December *QST* is to take place on April 30th. Tentative plans for traffic (making fullest use of RACES frequencies) are to be completed at a March meeting of ROs and SECs of New York, New Jersey and New England. All amateurs in these states are urged to find out from their EC, RO, SEC or SCM if necessary: (1) Any radio test details too late for this issue of *QST*. (2) How they can take part or assist. (3) How to get registered with the AREC or signed up to help under any applicable RACES plans.

**RACES Progress.** It has been some time since we reported the number of approved RACES plans. FCC's latest Annual Report indicated 89 such plans approved during the fiscal year that ended last June 30th, also 754 RACES stations had been authorized. As of the end of 1954 we are informed by the Federal Civil Defense Administration that 165 RACES plans now have been approved, another 76 in just the last six months. Besides this we're advised that 55 more are under study. The latest figure on amateur station RACES authorizations (December 31, 1954) indicates 1254 RACES station authorizations then had been issued. A full fledged nationwide test of stand-by radio communications dedicated to civil defense purposes is planned to accompany the coming June 14th-15th general c.d. alert. Amateurs not identified in RACES or AREC should make local inquiry of Radio Officers and ARRL ECs to register facilities and ask where they may serve in connection with this and future calls for civil defense emergency or natural disaster radio circuits.

**Directory of School Amateur Radio Clubs.** A new 1955 directory lists detailed information on 109 high school clubs with active stations, 26 additional stations identified with schools and college stations identified with the prep school net and a college amateur net. This must be an-

nounced as *available to other schools* that in asking for the directory, will furnish data for a listing of their own. Give your school club name, its station call, address, officers' names, bands operated, whether schedule is desired, days and hours desired, frequency used, number of club members, number of licensed operators, and dues. This High School Club Directory is not available from ARRL, but from Department of Health, Education, and Welfare, Mr. Willis C. Brown, W3HB, Specialist for Aviation Education, Office of Education, Washington 25, D. C.

**Taking Stock.** There are a good many ways to review progress as an individual amateur operator. Post mortems after Field Day or other activities enable us to improve procedure and know-how and to plan which bands to work next time. In "taking stock" we feel each amateur should consider whether he has or can take a part in a local AREC-RACES program, holds ARRL appointments to constructive ends, reports in his Section Net, etc. Only thus does the individual derive the benefits reflected from an *organized* amateur radio which carries more than casual implications.

The Detroit Amateur Radio Association stressed this principle of review-and-action in its QMN Bulletin recently. President Moline, W8GB, delineated five points to be checked by club member amateurs looking to individual and group progress in Amateur Radio. Resolutions suggested by the DARA treatment:

- (1) To come to club meetings often, with a purpose to make the club a better one and meetings interesting and enjoyable.
- (2) To check safety features of one's rig, from a.c. outlet to antenna, providing against hidden hazards.
- (3) To help newcomers to our hobby, particularly those younger and less experienced.
- (4) To complete shielding on TVI treatment of every transmitter, so all can operate without bothering decent versions of the one-eyed monster.
- (5) To ask one's self, "what am I doing in amateur radio that has public service to country, state or community or our *organized* amateur radio."

Early in February, we got together with some Civil Defense "brass" to discuss RACES matters in general and the forthcoming FCDA Region I RACES test in particular. During the noon hour, WIBDI lined us up in front of "ole 38" and took this snapshot. From left to right are the following: John Huntoon, W1HVO, ARRL Assistant Secretary; Vincent T. Kenney, W2BGO, N. Y. State C.D. Radio Officer and chairman of the Northeastern States Civil Defense Amateur Radio Alliance; Charles E. Dewey, W8LBM, from National FCDA Headquarters in Battle Creek, Mich.; George Hart, WINJM, ARRL NEC; James E. Fair, FCDA Region I Communications Officer.

**QST for**

**Check Rigs and WWV To Avoid Off-Frequency Citations.** W2FE (OO) reported early this year that "A lot of W and K stations are observed working phone beyond the 14.2-14.3 Mc. limits. Stations in the 14.1-14.2 sector were heard calling CQ 15, so apparently some of their multiplier stages are radiating from a poorly-shielded amplifier." According to OO reports the calibrations of 15-meter phone band edges are not appropriately checked back against WWV by some of the operators with VFOs.

Stations newly on the air (especially Novices) may well request some amateurs they work to listen for *their exact harmonic* to see if the harmonics, especially the third, are being heard at any distance. A grid-dip or absorption frequency meter can show up such defects in your equipment too. We mention this since OOs still report hearing WN harmonics quite plentiful.

### A.R.R.L. ACTIVITIES CALENDAR

Apr. 1st: CP Qualifying Run — W6OWP  
Apr. 13th: CP Qualifying Run — W1AW  
Apr. 16th-17th: CD QSO Party (c.w.)  
Apr. 23rd-24th: CD QSO Party (phone)  
May 7th: CP Qualifying Run — W6OWP  
May 12th: CP Qualifying Run — W1AW  
June 3rd: CP Qualifying Run — W6OWP  
June 11th-12th: V.H.F. QSO Party  
June 17th: CP Qualifying Run — W1AW  
June 25th-26th: ARRL Field Day  
July 2nd: CP Qualifying Run — W6OWP  
July 11th: CP Qualifying Run — W1AW  
July 16th-17th: CD QSO Party (c.w.)  
July 23rd-24th: CD QSO Party (phone)  
Aug. 5th: CP Qualifying Run — W6OWP  
Aug. 16th: CP Qualifying Run — W1AW

We also learn indirectly that one Novice was allegedly taken in by a mail approach (for cash money) *resembling* an off frequency citation from one of the FCC monitoring stations. Asking for money with citations is something *not* in the FCC pattern of such notices. See pars. 12.153-4-5 of our regulations for what to do about citations; also note that FCC penalties following an unsuccessful history of regulation observance generally take the form of a direct "suspension of license" where required, not a fine! Cash penalties are provided in Sections 501 and 502 of the Communications Act upon conviction by the Justice Department of willful violations. Regarding harmonics, ARRL Official Observers are doing all they can to help fellow amateurs keep out of trouble. In addition, amateurs actively operating are requested to especially watch the harmonic shadows of our bands, especially those falling in non-amateur territory so they can check themselves and others. By notification to a brother amateur of a signal heard out of the bands, either by message or postal card, any amateurs having unduly strong harmonics may be assisted to avoid an FCC notice.

**Ready for Field Day?** For some months the activities calendar has carried the announcement of Field Day dates, June 25th-26th. That is not so many weeks away now. We therefore suggest

that all hands plan for early completion of any new gear to be tested in this year's Field Day. Year 'round use of emergency-portable and mobile gear is of course to be highly recommended. Devices in daily use are conditioned for surest stand-by dependability when the chips are down. A rig on the shelf has greater likelihood of requiring work to repair it as well as time to rewire it and get the hang of the controls.

So get your gear in use ahead of time and in any event plan to test it in intensive operation come FD! Don't miss getting in the fun *this year*. Log forms for report of ARRL Field Day stations will become available about the last week in May. A letter or radiogram will bring yours gratis. All affiliated clubs have already received complete copies of the Field Day rules which will be re-run in June QST. C u FD? — F. E. H.

### JANUARY CD QSO PARTIES

A far-western trio, composed of W6LDR, W7BSU and W7PCZ, showed other ARRL appointment holders a thing or two in the January c.w. CD Party, Los Angeles ORS W6LDR setting the pace with 316 QSOs in 63 sections. The 'phone party was another contest-type workout; easterners W4FV, W2AEE and W4TVO lead the voicesters.

The highest scores follow. Figures after each call indicate score, number of contacts and number of ARRL sections worked. Final and complete results will appear in the April CD Bulletin.

<sup>1</sup> Multiple-operator station.

<sup>2</sup> W3ULI, opr.

— . . . —

Our next CD Parties are coming up this month. Any holder of an ARRL appointment or office will be eligible to take part. If you're interested in organized operating activities and do not already hold an appointment, see the list in the booklet *Operating an Amateur Radio Station* or the *Handbook* and decide which appointment suits your interest and qualifications. Then write your SCM or the ARRL Communications Department for complete information on how to qualify for the appointment of your choosing.

### W1AW OPERATING NOTE

Effective April 24, 1955, all W1AW operation as detailed on page 71, March QST, will change to *Eastern Daylight Saving Time*. This means that to copy code practice, bulletins, etc., you will have to listen one hour earlier by your clock if you are in areas which remain on standard time. Similarly, all general operation shown in the chart on page 70, September 1954 QST, will be conducted on EDST instead of EST until further notice. The complete W1AW summer schedule of operations will appear in the Operating News section of May QST.

# With the AREC

This year's winner of General Electric's Edison Award, as noted elsewhere in this issue of *QST*, is Ben Hamilton, W6VFT, SEC for our San Diego Section and RACES Radio Officer for San Diego County, Calif. We had the opportunity to visit Ben and inspect part of his installation last summer. The award was presented at the customary exercises in Washington on Feb. 10th.

Make no mistake about it, such recognition does not come easy. Ben was selected from a considerable number of candidates, after careful screening of the qualifications of each. While his selection was a signal honor to W6VFT, it is also an honor, by reflection, to all of us amateurs who have devoted our efforts toward civil defense work; and that means most of the AREC. In fact, the principal speaker at the presentation was Val Peterson, FCDA administrator, who paid high tribute to amateur radio, and indicated that in the event of an atomic attack it was quite possible that RACES might be the first and *only* means of communication in the immediate post-attack period.

Does that frighten you a little? It should. It should frighten all of us out of any complacency or lethargy we might be experiencing and get us going toward a bigger and better RACES through our own AREC. Because, just as the Edison Award to W6VFT for civil defense (RACES) work is a tribute by implication to all of us, the responsibility of being prepared to provide the *first and only* immediate post-attack communication is a serious and sobering one.

W9UQT reports on the work done by amateurs in the ice storm which centered about Clinton, Ill., on December 30th. The storm lasted about 24 hours, and work done was principally on behalf of the Illinois Central Railroad, who asked the amateurs to help. W9KRH/9 was set up at the ICCRR depot for the period of the emergency, manned by W9KRH, W9KXN, W9PEK and W9VHD. Some 40 railroad traffic items were handled by amateur radio that could not be handled any other way. As usual, the Illinois Emergency Net went into operation almost immediately on 3940 kc. There was full cooperation of all net members standing by, ready to help when possible. Doc mentions the work of W9KXN as especially noteworthy, and also commends W9WHH and W9OOL for their untiring efforts in relaying and keeping the frequency cleared. The following were also logged as having participated. *W's* AEZ AJK ATJ BCY BUH CNB CSW DJG DKA DNL ESB

## NATIONAL CALLING AND EMERGENCY FREQUENCIES (kc.)

C. W.	'PHONE
3550 14,050	3875 14,225
7100 21,050	7250 21,400
28,100	29,640

During periods of communications emergency these channels will be monitored for emergency traffic. At other times, these frequencies can be used as general calling frequencies to expedite general traffic movement between amateur stations. Emergency traffic has precedence. After contact has been made the frequency should be vacated immediately to accommodate other callers.

The following are the National Calling and Emergency Frequencies for Canada: *c.w.* — 3535, 7050 14,060; *'phone* — 3765, 14,160, 28,250 kc.

Members of the Huntsville (Ala.) Amateur Radio Club turned out on Feb. 1st when a tornado struck Normal, a small community north of Huntsville, and took the control stations for the Highway Patrol, city police and sheriff off the air. Promptly at the scene of principal damage, in the vicinity of Alabama Agricultural and Medical Institute, were W4s AQB BJJ/m BSN FOG HHU WOF/m YQE/m ZSB and KN4AIL. All but one of these are AREC members. First news of the damage was brought from the affected area to the city by amateur radio.

Amateurs in South Dakota joined forces with law-enforcement agencies in late January to help track down a bank robber. W000Z and other members of the Sioux Falls Amateur Radio Club spread the alarm along four states following the bank robbery at Harrisburg, S. Dak., requesting that all amateurs notify their local police and the small towns notify their garages and filling stations in the area. Although the robber hasn't been caught yet, amateurs received high praise from the sheriff of Minnehaha County for their efforts.

Another instance of amateurs assisting in highway accidents. On October 18th, W2GKP received an emergency call from W2BRP/m on 10 meters at the scene of an automobile accident on the West Side Highway in New York City. W2BRP requested an ambulance via W2GKP. The ambulance arrived on the scene within three minutes.

"During the afternoon of Feb. 6th there was a weather warning for possible tornadoes in the area covering most of middle Georgia. As EC of Houston County, Ga., I started a net on 3995 kc. to keep a frequency clear in case of an emergency — also to gather weather information. W0RV/4 alternated with me as net control." — *W5RDP/4, EC, Houston Co., Ga.*

On Feb. 5th, the police chief of Dartmouth, Mass., called for volunteers to assist in searching for a missing seven-year-old boy. Local amateurs turned out to assist, under direction of Assistant EC W1WGN. New Bedford mobiles W1s AGG AZY and ZPE also responded. W1CDO acted as relay station in New Bedford. From Fairhaven, mobiles W1s AWH ONK and ZHC responded, with W1APN for fixed relay. W1BMQ was also on hand with his mobile from Dartmouth. The amateur mobiles cooperated with Dartmouth Police, the Dartmouth Fire Department, the CAP and the Coast Guard in providing thorough communications coverage of the search area. The story has a sad ending — the boy's body was recovered from the bottom of Padanaram Harbor — but amateurs were on the job to do what they could, as usual. — *W1AVI, EC, New Bedford, Mass.*

Tennessee SEC W4RRV tells us that for some time he has wished to do something to encourage the Novice licensee to become actively interested in emergency work. Now he's done something about it. On Feb. 2d, the Tennessee Novice Emergency Net came into existence on 3737 kc. The net will have only Novices for members, except for the NCS, who will hold appointment as an EC and will be General Class or better. Within the AREC organization, the net will act as a unit under its EC, with the latter issuing AREC member cards. W4RRV figures on an almost complete turnover every six months as Novices get their General Class licenses and "graduate" to their local AREC units as full-participating members.

Fifteen SECs reported December activities of 4620 AREC members, to wind up our 1954 season. Two new sections, Missouri and Minnesota, put in their appearance in December reports, making it 31 sections heard from during 1954, a total of 178 SEC reports received during the year. This compares favorably with the figures for 1953 and 1952: in 1952, 204 reports were received from 29 sections, and in 1953 154 reports were received from 25 sections.

One-hundred-percenters: Western N. Y., N.Y.C.-L.I., E. Fla., Wisconsin, S. Dak. Eleven reports: Colo. Ten re-

ports: Los Angeles, W. Fla. *Nine reports:* E. Bay. *Eight:* W. Va., Tenn. *Seven:* Georgia. *Six:* N. Texas, Montana, San Joaquin Valley. *Five:* Nevada, New Mexico. *Four:* Alaska. *Three:* Ontario, Ariz., Vt. *Two:* Nebraska, Ore., Louisiana, Alabama. *One:* Saskatchewan, Idaho, Md.-Del.-D.C., Okla., Mo., Minn.

SCM W9RQM says his SEC, W9OVO, has reported EC activities 46 consecutive months, and he thinks that's a record. Any challengers?

## RACES News

Amateurs in the New England States, New York and New Jersey (FCDA Region I), will be readying themselves for the April 30th test of RACES facilities to be held in that FCDA Region. If you live in Region I (above states), it behooves you to get signed up in your local AREC or/and RACES group with a view to contributing your strength to this display of amateur radio potential. The First Region is just a guinea pig, to give FCDA an idea what can be expected of amateurs and RACES in the forthcoming June 14th-15th nationwide exercise. Organizers in other regions please take note that *your region is not being left out*. While there will be no other FCDA-sponsored tests on that date, the capability of amateurs in RACES in your region will be judged on the basis of the performance of amateurs in Region I, and plans for the June nationwide test made accordingly. So this April 30th test is not a signal for you to relax and let Region I do it, but a notice to make sure your region can make as good a showing as Region I in any test of your RACES facilities, real or fancied.

-----

Some time ago ARRL sponsored, at FCDA request, a competition to design a RACES emblem, to be adopted as the official RACES emblem by FCDA. Many suggestions were received and sent down to FCDA for consideration. After extensive deliberation, a design most nearly following one suggested by W1JMY was adopted and promulgated as the official RACES insignia as of March 4, 1954. We don't believe we have ever reproduced this emblem in *QST*. Note that there is room for inclusion of the name of a city or county (or even a state) at the top of the emblem, and such inclusion is contemplated. This emblem can be used by RACES personnel in the same manner as the regular civil defense insignia, as prescribed by FCDA regulations on July 12, 1952. We wish to express belated thanks to all amateurs who submitted a design, some of them at considerable trouble.

-----

The Warning and Communications Office of FCDA now has Charles E. Dewey, W8LBM, formerly W0LBM of Jefferson City, Mo., on its staff to implement the RACES program. Charlie is no stranger to us, having participated with us in the week-long FCDA Communications Conference at Olney, Md., in 1951. He is also no stranger to RACES, having served as RACES state radio officer for Missouri. Another amateur will soon be on the FCDA staff to assist Charlie in this work, so we can look for some progress from that level, and additional material from time to time for this column. Other amateurs at FCDA headquarters, not necessarily having any connection with RACES, are Communications Specialists W4KCZ (ex-K3FBG, W9KCZ, V04AC, 9EMC), W4DLA (ex-W3SEI, W2SEI), W8UTQ (ex-W4CGK, KL7YT), and Electronics Engineer W3UII (ex-W5UH).

-----

In the future, we'll endeavor to include items on RACES under this subhead. This will include, but not be restricted to, information coming out of FCDA Headquarters each month. Short items from the field will be welcomed and will be reproduced herewith after editorial consideration concerning their suitability. Let us hear what's going on in your RACES unit.

These amateurs in Georgetown, S. C., were among the first to feel the impact of Hurricane Hazel as she swept inland last October. From left to right, kneeling: W4KTI, W4ZGP; standing: W4DYP, K4ADP, W4FTN.

## GROUP CODE INSTRUCTION

Affiliated clubs planning a series of lessons designed to aid the code trainee would do well to note the availability of ARRL training aids. One of the most useful items, a TG-10 keyer, produces an audio tone from inked paper tapes. The tapes are available for use with the keyer or may be made by use of another item, a BC-1016 inked tape recorder. We'll be pleased to supply copies of a Reference Guide for Code Trainees to help get things started. Have a club officer write to Communications Department for further information on reserving a keyer or recorder for one convenient month-long period.

## BRIEFS

Propagation tests to determine the possibility of maintaining continuous reliable communication on 2, 6, 75, 80 and 160 meters are being conducted in New York, New England and New Jersey, each week end from 1800 EST Friday to 1800 Saturday. Sponsored by amateurs at Rensselaer Polytechnic Institute, the tests are expected to furnish valuable data to the services performed by amateur radio as well as amateur communications in general. The following frequencies are being used: 1815, 3509.5, and 3993 kc.; and 53.5 and 145.47 Mc. Persons interested in participating are requested to contact Roger Salaman, Hunt II, RPI, Troy, New York.

-----

The WAM award will be made to any amateur submitting confirmation of two-way radio contact with all sixteen counties in Maine any time after 12:01 A.M. January 1, 1955. Inquiries or petitions for awards should be addressed to the Portland Amateur Wireless Association, 97 State Street, Portland, Maine.

-----

A "Ground-Wave Contest" was held November 20, 1954, by the Breezeshooter's group, W3SIR reports. Competition for contacts was scored for winners in four zones, Zones 1-2-3-4 being, respectively, in 25-, 50-, 75- and 100-mile concentric circles centered on Pittsburgh, Penna. Winners and their scores: W3QYF 164, W3SJK 156, W3VUZ 125 in Zone 1; W8FRV 96 in Zone 2; W3WJF/3 81 in Zone 3; WSGAB 176 in Zone 4.

## TRAFFIC TOPICS

We thought that this month a few data from the new Net Directory might be of interest. It's quite a production, consisting of 14 multilithed pages and registering 357 net names as of December 15, 1954 — the biggest Net Directory we've put out yet. These 357 net names are registered on 193 frequency channels throughout six amateur bands. As usual, the 3.5–4.0 Mc. band carries the brunt of the net load, with 101 frequency channels being utilized by 233 nets in that band. This is slightly less than 5 kc. per channel. The 3.5–3.7 Mc. segment uses 47 channels (4.25 kc. per channel) and the 3.8–4.0 Mc. segment used 41 channels (4.88 kc. per channel). There are 12 channels used in the 160-meter band, 9 on forty c.w., 36 on ten, 7 on six and 27 on two meters.

Of the 357 registered net names, 304 indicated their purpose. There were 237 nets which indicated a single purpose; the others indicated dual or triple purposes. Of the single-purpose nets, 118 were devoted to traffic, 111 to emergency preparedness, and 8 to rag-chewing. There are also 47 nets devoted to both traffic and emergency work, 11 to traffic and rag-chewing, 7 to emergency and rag-chewing, and 2 to traffic, emergency and rag-chewing. This means that 178 nets can be called traffic nets, 167 can be called emergency nets, and 28 can be called rag-chewing nets.

The net directory is now available free of charge upon request, and we hope that net organizers, participants and potential participants will make the best possible use of it.

— . . . —

There still seems to be some confusion regarding counting of net traffic. As usual, ARRL has set a standard, and this standard is followed throughout the National Traffic System. Whether or not your net follows that standard is up to you, of course. In the past, we have assumed that net traffic reported in this column has followed the League's simple net traffic counting system. If such has not always been the case, then there has been little or no basis for comparison between the traffic totals of the various nets reported.

The net traffic is that traffic handled by the net in *directed session*. It is *not* the traffic total of each station in the net; it is *not* the total of all traffic reported into the net. It is purely and simply the number of message *handlings* between the time of net call-up and QNF. If a message is sent from one net station to another, at the direction of the NCS, and properly QSLd at the receiving station, that's one point. The net traffic total is simply the number of times this process is repeated during a net session. The same message cannot be counted twice unless it is sent and received twice in the net.

It would help if we all followed this simple and logical procedure. Let's not get net traffic counting mixed up with individual station traffic totals.

— . . . —

Miscellaneous January net reports: College Net — 63 stations called in, 12 messages handled. Early Bird Transcontinental Phone Net — 813 messages. North Texas Oklahoma Section Net — 319 messages, 979 check-ins. Transcontinental Relay Net — 31 sessions, five stations, traffic total of 1260. Transcontinental Phone Net (1st Dist.) — 16 stations, traffic total 1817.

— . . . —

W0LJW sends in an amusing little story. It seems his QTH is afflicted with severe line noise. One evening in participating in TLCN (Iowa NTS Section Net), he discovered there was traffic for his city. He called W0CGY on the landline to ask his assistance, only to learn that CGY's transmitter was out of operation. They got the traffic through, though. W0CGY did the receiving, called the "breaks" to his XYL who relayed them over the landline to W0LJW, who did the breaking and asking for repeats. W0LJW says "everything went fine except for the NCS, W0BLH, who thought we were slightly nuts."

— . . . —

WN5GQN reports the organization of a net for Novices in Texas. It is called the Texas Novice Traffic Net (TNT) and operates on 7191 kc. at 1900 CST on Tuesdays. Dave (WN5GQN) says all Novices are welcome and gives the following threefold purpose of the net: (1) to provide an opportunity for Novices to learn correct operating procedure; (2) for public service; (3) one of very few organized Novice activities.

— . . . —

National Traffic System. Conditions continue being unkind to us. NTS nets have been beset with the worst kinds of

difficulties because of the long skip setting in at about 1900 local time each evening. Someone not too familiar with organized traffic work recently asked us why we were so unadaptable, why we didn't simply handle our traffic at a different time, just as the DX man adapts himself to working DX at a different time when conditions demand it. Well, to some extent we have done this. The independent net without any system can do it easily, provided a new net time is convenient to its members. But NTS must operate in chronological sequence; its nets telescope into each other. One of the main purposes of NTS is to work together as a national system, and you can't do this when every net operates at a different time, handles traffic from and for all over the map, and pays no slight attention to when other units of the same system operate, or where, or what they do.

These "bad" conditions, however, tend to lead us in this direction. A section net, because it can hear distant stations but not its own, either becomes a net taking in a lot of territory, or it moves to an earlier meeting time. No doubt about it, the present state of the radio spectrum is conducive to hodgepodge in traffic systems. What are we going to do about it?

Nothing. Just wait. Just continue doing the best we can and wait for conditions to get back to where they used to be when NTS was first put into operation. Maybe then, too, we can return to a more normal and uniform NTS time schedule.

\* Out of 26 sessions held

\*\* Out of 47 sessions held

\*\*\* Section nets reporting: NEB (Nebr.); TLCN (Iowa); QKS & QKS-SS (Kans.); CN (Conn.); ILN (Ill.); Tenn. Regular and Tenn. Early; AENB & AENP (Ala.); SCN (Calif.); WSN (Wash.); KYN (Ky.); Minn. Phone.

Several NTSSers have asked us how we calculate the "rate" above, and a couple of managers have disagreed that the way we do it indicates anything. The "rate" is the number of messages handled per minute during the busiest session of the month. It indicates the net's efficiency "under load." We apply it only to NTS regional and area nets, since the achievement of a high rate of traffic handling is perhaps of less importance at section level where the main objective is representation. Accuracy, of course, is paramount at any speed.

W2LPJ reports that the early session of 2RN at 1815 EST is handling most of the traffic. The dragnet is out for a new 3RN manager, with W3ONB wishing to be relieved; we ought to have one by this time. Arkansas and Mississippi remain problems on RN5; new RN5 certificates have been issued to W4TYU, W4WOG, W5CAF, and W5MXQ. RN7 is completely without representation from Saskatchewan and Alberta, and during January had very little from Montana and Alaska. New 8RN certificates have been issued to W8s ILP, LHV and MQQ. W9UNJ has difficulty in getting NCS reports in 9RN, thus the lack of statistics above; W4KKW, W9CCO, K4FBW and K9FCA have earned 9RN certificates. VE3AUU is a newcomer to the TRN roster.

TCC continues to function with the usual difficulties, mostly brought about by the need for additional personnel and inability of existing operators to make contact with their TCC schedules. W8UPB, for Eastern Area TCC, reports that there were 34 TCC QNIs into area nets during January, with W8DQG handling the greatest amount of traffic. He needs two regulars, one on Tuesday to relay traffic to PAN via direct schedule, and one on Monday (late) to receive traffic from PAN. Other schedules are functioning, but many of them are irregular. W9JUI, for Central Area TCC, reports that schedules are working nicely, but whenever missed the station concerned makes direct contact with the Pacific Area Net to clear traffic. In the Pacific Area, W6HC reports that all TCC stations are active, but having difficulties. W0EKQ handled the most traffic (102). The latest Pacific Area TCC roster shows W6UTV deleted and W6PKL/0 added to the list.

There are still some openings in the TCC roster. Write W8UPB, W9JUI or W6HC, if interested.

## BRASS POUNDERS LEAGUE

Winners of BPL Certificates for January traffic:

BPL medallions (see Aug. 1954 QST, p. 64) have been awarded to the following amateurs since last month's listing: W1BDI, K1WAB, W2LPJ, W2RUF, W4DVR, W4PUJ, K6FCY, W6ZPJ, W5FQ, W5RO, W9TT, W0FQB, W0KQD, W0TQD, KA2HQ.

The BPL is open to all amateurs in the United States, Canada, Cuba, and U. S. possessions who report to their SCM a message total of 500 or more, or 100 or more originations-plus-deliveries for any calendar month. All messages must be handled on amateur frequencies, within 48 hours of receipt, in standard ARRL form.

## NONDIRECTIONAL CQs?

When W1WPO heard a T12 calling "CQ NO USA" on 7 Mc, one evening recently, he moved near the Costa Rican's frequency and called "CQ NO T12." The T12 promptly called W1WPO and a friendly rag chew resulted. . . . W1VG reports use of nondirectional CQs with ringing success. Three times in a row Pete called "CQ NO ASIA" and sure enough, no Asians replied!

## ELECTION NOTICE

(To all ARRL members residing in the Sections listed below.)

You are hereby notified that an election for Section Communications Manager is about to be held in your respective Section. This notice supersedes previous notices.

Nominating petitions are solicited. The signatures of five or more ARRL full members of the Section concerned, in good standing, are required on each petition. No member shall sign more than one petition.

Each candidate for Section Communications Manager must have been a licensed amateur for at least two years and similarly a full member of the League for at least one continuous year immediately prior to his nomination.

Petitions must be in West Hartford, Conn., on or before noon on the closing dates specified. In cases where no valid nominating petitions were received in response to previous notices, the closing dates are set ahead to the dates given herewith. The complete name, address, and station call of the candidate should be included with the petition. It is advisable that eight or ten full-member signatures be obtained, since on checking names against Headquarters files, with no time to return invalid petitions for additions, a petition may be found invalid by reason of expiring memberships, individual signers uncertain or ignorant of their membership status, etc.

The following nomination form is suggested: (Signers will please add city and street addresses to facilitate checking membership.)

Communications Manager, ARRL. [place and date]  
38 La Salle Road, West Hartford, Conn.

We, the undersigned full members of the . . . . .  
. . . . . ARRL Section of the . . . . .  
Division, hereby nominate . . . . .  
as candidate for Section Communications Manager for this  
Section for the next two-year term of office.

Elections will take place immediately after the closing dates specified for receipt of nominating petitions. The ballots mailed from Headquarters to full members will list in alphabetical sequence the names of all eligible candidates.

You are urged to take the initiative and file nominating petitions immediately. This is your opportunity to put the man of your choice in office.

— F. E. Handy, Communications Manager

## ELECTION RESULTS

Valid petitions nominating a single candidate as Section Manager were filed by members in the following Sections, completing their election in accordance with regular League policy, each term of office starting on the date given.

Minnesota	Charles M. Bove, W9MNC	Feb. 17, 1955
Oregon	Edward F. Conyngham, W7ESJ	Mar. 1, 1955
Manitoba	John Polmark, VE4HL	Mar. 2, 1955
British Columbia	Peter M. McIntyre, VE7JT	Mar. 13, 1955
Santa Barbara	William B. Farwell, W6QJW	Apr. 12, 1955
Southern Texas	Morley Bartholomew, W5QDX	Apr. 29, 1955

See special notice in New England Division this month concerning Western Massachusetts.

In the Hawaii Section of the Pacific Division, Mr. Samuel H. Lewbel, KH6AED, and Mr. Richard L. Hoyt, KH6AVO, were nominated. Mr. Lewbel received 96 votes and Mr. Hoyt received 42 votes. Mr. Lewbel's term of office began Feb. 3, 1955.

In the Mississippi Section of the Delta Division, Mr. Julian G. Blakely, W5WZY, and Mr. A. C. McKinney, W5JR, were nominated. Mr. Blakely received 75 votes

and Mr. McKinney received 71 votes. Mr. Blakely's term of office began Mar. 8, 1955.

In the Missouri Section of the Midwest Division, Mr. James W. Hoover, W0GEP, and Mr. Gerald N. McReynolds, W0MFB, were nominated. Mr. Hoover received 178 votes and Mr. McReynolds received 144 votes. Mr. Hoover's term of office began Mar. 1, 1955.

In the Western Pennsylvania Section of the Atlantic Division, Mr. Richard M. Heck, W3NCD, and Mr. Anthony J. Mroczka, W3UHN, were nominated. Mr. Heck received 253 votes and Mr. Mroczka received 162 votes. Mr. Heck's term of office began Mar. 17, 1955.

In the Maryland-Delaware-District of Columbia Section of the Atlantic Division, Mr. J. W. Gore, W3PRL, Mr. Harold E. Archer, W3SKK, and Mr. W. Lloyd Carter, W3UWO, were nominated. Mr. Gore received 204 votes, Mr. Archer received 191 votes, and Mr. Carter received 175 votes. Mr. Gore's term of office began Mar. 21, 1955.

## BRIEFS

The Tri-County Amateur Radio Club of Brattleboro, Vt., is offering a handsome certificate to any amateur submitting proof (QSLs or Vermont QSO Party logs) of two-way communication with amateurs in 13 of Vermont's 14 counties. Send confirmations to Ray N. Flood, W1FPS, 2 Marlboro Avenue, Brattleboro, Vt. See page 100 for details on the Vermont QSO Party, scheduled for Apr. 9th-10th.

Amateur radio in the Wisconsin area is looked upon by educators as being a vital educational experience. As reported by W9OTL, at a Milwaukee meeting of the Wisconsin Education Association in November, 1953, a group of teachers organized the Amateur Radio Section of the WEA and set up plans for the Wisconsin Educator's Phone Net. This basic organization has coordinated the efforts of state school amateur radio clubs. Its individual members have demonstrated amateur radio to thousands of students with the result that several new school radio clubs have been organized and dozens of students licensed. To help train Novices in code and message handling, 3735 kc. is used as a net frequency at 1220 CST and 1630 CST on all school days. The spot 3850 kc. will continue as the WEA's 'phone net frequency at 1000 CST Saturday and 1530 CST on the second and fourth Friday of each school month.

## CODE-PROFICIENCY PROGRAM

Twice each month special transmissions are made to enable you to qualify for the ARRL Code Proficiency Certificate. The next qualifying run from W1AW will be made on April 13th at 2130 EST. Identical texts will be sent simultaneously by automatic transmitters on 1885, 3555, 7125, 14,100, 21,010, 52,000 and 145,600 kc. The next qualifying run from J60WFP only will be transmitted on April 1st at 2100 PST on 3590 and 7138 kc.

Any person may apply; neither ARRL membership nor an amateur license is required. Send copies of all qualifying runs to ARRL for grading, stating the call of the station you copied. If you qualify at one of the six speeds transmitted, 10 through 35 w.p.m., you will receive a certificate. If your initial qualification is for a speed below 35 w.p.m., you may try later for endorsement stickers.

Code-practice transmissions will be made from W1AW each evening at 2130 EST through April 23rd; after that date they will be at 2130 EDT. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately 10 minutes' practice is given at each speed. References to texts used on several of the transmissions are given below. These make it possible to check your copy. For practice purposes the order of words in each line of QST text sometimes is reversed.

### Date Subject of Practice Text from February QST

Apr. 5th:	A C.W. Man's Control Unit, p. 11
Apr. 7th:	A Crystal-Controlled 144-Mc. Converter, . . . p. 15
Apr. 11th:	A Variable Bandwidth Filter, p. 17
Apr. 15th:	A Three-Bandmultiplier-Driver, p. 20
Apr. 18th:	Remote End-Ped Antenna, . . . p. 24
Apr. 21st:	A Loudspeaker Enclosure, . . . p. 26
Apr. 26th:	A Steerable Array for 7 and 14 Mc., p. 28
Apr. 29th:	Meet "Junior" — He's No Lid!, p. 31

• All operating amateurs are invited to report to the SCM on the first of each month, covering station activities for the preceding month. Radio Club news is also desired by SCMs for inclusion in these columns. The addresses of all SCMs will be found on page 6.

## ATLANTIC DIVISION

**EASTERN PENNSYLVANIA**—SCM, W. H. Wiand, W3BIP—SEC, IGW, RM: AXA, PAM: PYF, E. Pa. Nets: 3610, 3850 kc. The following clubs report new officers for 1955: Electric City ARC elected LCK, pres.; OST, vice-pres.; NNH, secy.; LJT, treas. Northeast RC of Philadelphia elected VOC, pres.; TYX, vice-pres.; MYL, treas.; K2JUW, rec. secy.; DYI, corr. secy.; KIW, DWR, HYJ, CLC, and JQP, exec. board. South Philly (SPARK) elected QIZ, pres.; FZR, vice-pres.; VSD, secy.; ZMO, treas. ARK, Pottstown ARA president and a newly-appointed OO, came up with a suggestion that is worth the attention of all clubs dealing with the training of Novices. In monitoring the Novice bands with the aid of two receivers, one tuned to the fundamental, the other tuned to the second harmonic frequency, ARK has found not only strong harmonic radiation from many in the Novice bands but a surprising amount of stations calling CQ in vain on the "out-of-the-amateur-band" second-harmonic frequency without a trace of these stations on the expected fundamental frequency. This leads Jack to believe that these stations are in need of training in the use of a grid-dip oscillator or absorption-type wavemeter. Also, further training in the proper methods of antenna-to-transmitter coupling. All clubs might include this in their Novice training program. These stations need our help. It's up to those of us with the know-how to give all the help possible. BES and EAN report attending the joint meeting of the FRC/PVRC in Washington where about 80 turned out to hear about FOSAJ and Navassars expeditions. JNQ says he lost 15 pounds while "batching it." PYF is home again after a three-week business trip that took him through Texas and Oklahoma. CUL also is back home after enjoying a fine trip to Florida. During the January 18th Aurora opening, TDF worked Illinois on 2 meters to bring his total states worked to seventeen. In answer to many queries regarding the forthcoming SCM election, yours truly will bow out in favor of someone with more time to devote to the job. My sincere thanks for your cooperation and good luck to my successor. Traffic: (Jan.) W3CUL 2327, BFF 180, ELI 155, OK 121, UKJ 116, OZV 108, TEJ 102, VVV 95, QIZ 94, WUE 88, DU1 58, AXA 50, UOE 45, GES 42, GIY 26, PYF 23, YAZ 21, KCG 11, JNQ 7, PVY 7, UUA 2, BES 1. (Dec.) W3AXA 124, ABT 6, EAN 4.

**MARYLAND-DELAWARE-DISTRICT OF COLUMBIA**—SCM, Arthur W. Plummer, W3EQK—TDV, SJF, and NUV will be trying for the 21,000-Mc. record this year and also are going to try 30,000 Mc. NUV will be on 420-Mc. TV before long. The ARA officers are VAM, pres.; YRK, vice-pres.; NZT, secy.-treas.; OXL, act. mgr.; and RAH, net comm. mgr. The ARA also passed a motion that a year's subscription to QST shall be awarded to the club winner of any ARRL-sponsored contest. PQ sends the SCM a very kind letter which we now publicly acknowledge. FU reports a fine ESARC meeting at Cy's place on the Snow Hill Road Jan. 28th at which a swell General Electric movie was shown. Maurice Mowbray, the blind radio and TV serviceman of Federalsburg, Md., is sporting the call AAR and a Viking II. JM, FU, VCN, BSV, and BM are active with a.s.b. AED is stirring up mobile interest with his new rig. The ESARC's big winter meeting was held at the English Grill in Salisbury Feb. 25th. WN3AKT and WN3AKU have been added to the Washington County rolls with the help of VAM, radio instructor at the Hagerstown High School. Harford County, through the efforts of LDD and Paul Seward, CDRO for the County, expects to get a Viking II and an NC183-D. LDD got his S-40 back in operation again. SCPN still is on night instruction duty for Philco. 9QOI broke into the Harford County Net with a potent signal, it is reported. CVE reports 50SZ and

6BMW approved as TCRN members. KL7ATO/9, ex-9EBL, who is a TCRN operator, is now 9XQW. K3WBJ uses BC-610, HRO-60, and three-element beam on 20, Viking II and HRO-M with Windham on 40, and Viking I with HQ-140X and 800-ft. long wire on 80 meters. ISDO, chief operator at the Army Medical Center, operates MARS nets plus CS3AC and OE13USA Mon. through Sat. on 20 meters. RV is now operating OK on 54,520 kc. HUA, pastor of the Northwestern Presbyterian Church in Washington, D. C., as well as Current Moderator of the Presbytery in D. C., is active again after a lay-off of several years and is on 40-meter 'phone. PPK has a new receiver and is on 20 meters. Brig. Gen. Heaton, Commanding General of Walter Reed Hospital, the Army Medical Center, is studying code and theory in preparation for the exam for a ham ticket. All the operators at K3WBJ, as well as the trustee, Walter Reed Hospital Chief Chaplain, Lt. Col. A. V. Bradley, WVI, are teaching 75 patients and duty personnel who are interested in becoming hams! TLU has been assigned to full time duty at WBJ. PQ formerly was 9PQ and also held 8KRT and 3HRQ. WAF finally made WAS. EEB has been helping WN3AHW to get on the air. KCY has just purchased a Johnson Viking Adventurer and OSF has one on order. QCB says he is attending a school where he is getting 37 weeks of training in 30 days! CDQ reports she was on 20-meter c.w. during the month of January. The Washington Radio Club has code classes going again and PZA is being reactivated. TGF reports the DuPont High School in Wilmington, through the efforts of WBZ, now has some Novice licensees. Thus far the licensed hams in the P. S. DuPont High School are W3WBZ, WDA, WCY, and TGF. Novices are WN3ARE and WN3ASB. ECP has been lining up some 6- and 2-meter equipment. With his new 60-watt Ranger BYI has worked OE1FF, OZ7OM, DL2WV, PA0DV, GM3JXR, PY5PG, EA9AP, G3JTC, KZ5DK, and LU5G, as well as OA5G and others. Other low-power specialists in the area are IXJ, TDV, and OEJ. VZM is installing a four-element wide-spaced beam with a 40-ft. boom on a 70-ft. tower. HEC raised his 20-meter beam to 60 feet. Your SCM, EQK, wants to take this opportunity to thank all for their interest in ARRL and their good wishes and kind remarks. Traffic: (Jan.) W3WV 598, CYE 511, K3WBJ 360, W3PKC 242, UE 169, RV 82, ECP 53, GRB 38, PQ 17, HC 15, CQS 9, JZY 7, EQK 5, OYX 5, NNX 4, WKB 4, WAF 2. (Dec.) W3MCG 85, ECP 18, OYX 11, TGF 1.

**SOUTHERN NEW JERSEY**—SCM, Herbert C. Brooks, K2BG—PAM: ZI, K2JIG, ex-3BOX, is now located in Glassboro and is at present on 20-meter c.w. K2GYM received his General Class ticket and K2ARP and W2HEK are consistent operators in Salem County. K2GKV, Pennsgrove, promises to keep us posted on news from that area. 5DYG, ex-2DGN, is now located in Tulsa, Okla. Look for Russ on 40 meters. SJRA members enjoyed a talk presented at their January meeting by 3SHY, assisted by 3EOZ, entitled "Single Sideband Techniques." K2EY, ex-3OS, Westmont, is on 10 meters. SDB urged all SJRA DXers to take part in the International DX Contest. UAE, Trenton, is operating on 75-meter 'phone. BAY is building a 10-meter vertical. The new QTH of 9RQK/2 is Lawrenceville. SUG, Milford, reports activities curtailed because of business and travel. K2H2R made BPL again this month. The 10th Annual Old Timers Net Round-Up and the 25th Anniversary of DYRA will be held Apr. 23rd at the Hotel Stacy Trent, Trenton, N. J. Contact ZI for details. ZQ is net control of the N. J. 75-meter Net which meets Sun. at 0900 on 3900 kc. Glad to have VU (Lt. Col. Kale) back in the U. S. The Burlington County Radio Club station, K2KED, is holding regular drills on 2 and 10 meters. A big increase of activity reports (Form 1) is greatly appreciated. Keep up the good work. Traffic: (Jan.) W2RG 163, K2H2R 155, W2ZVW 58, ZI 38, YRW 19, K2BG 17. (Dec.) W2ZVW 131, K2CPR 5.

**WESTERN NEW YORK**—SCM, Edward G. Graf, W2SJV—Asst. SCM: Jeanne Walker, 2BTB. SEC: UTH/FRL, RM: RUF, PAMs: GSS and NAI. NYS meets on 3616 kc. at 6:30 p.m. and 3925 kc. at 7 p.m.; NYSS on 3595 kc. at 8 p.m.; NYS C.D. on 3509.5 and 3993 kc. at 9 a.m. Sun.; TCPN 2nd call area on 3970 kc. at 7 p.m.; SRPN on 3970 kc. at 10 a.m.; ISN on 3980 at 3 p.m. Are you an AREC member? It is important that your EC have your registration and know when you are available for emergency work. Register NOW. RAWNY now is licensed under the call PE in memory of one of its founders and a charter member. First project of the new ARAT is a course for Novices instructed by OUJ. CARS also is holding classes in code and theory under the direction of GDI. RPO spoke

at a KBT meeting on "TVI Filters." PGU made DXCC and WAC. K2DYB is organizing a 6-meter AREC net in Madison County. UHI spoke at an ARAT meeting on S.S.B. and JUL on Power Supplies for the Beginner. The Elmira ARA was guided on a tour of the Flicking station by D. Hamilton. The RARA v.h.f. group met at the home of K2CEH. K2s DXY and GYU helped Q1HH put up a skywire 50-ft. high. GBX has been appointed OBS. K2s CEH, DYC, and EVJ are OBS. UTH/FRU renewed as SEC. SJV and UTH again are appointed as Asst. Directors, Atlantic Division. V.h.f. enthusiasts in the Syracuse Area are forming a v.h.f. club. Contact RHQ for details. UFI lost 144.220 and 420-Mc. beams in a recent storm. HAX, VLV, UFI, and K2EPH are on 420 Mc. The KBT meeting was devoted to a discussion of "Operation and Uses of Oscilloscopes." K2CUQ graduated 3 pupils from the Novice training class. EIMW finally received a QSL from Heard Is. ALR addressed RAWNY on "Amateur Test Equipment." UXP has 832 final into a sixteen-element beam on 220 Mc. K2DVC built a 15-meter beam per Jan. QST but redesigned it to also work on 20 meters. 1UHL/2, KN2s JVH, IMI, and JVG are trying to establish an amateur radio club at the U. of Rochester. Stations in Oswego, Fulton, Auburn, Cortland, Watertown, Rome, Utica, Oneida, and Syracuse are requested to contact CYD, Onondaga Co. EC, to establish contact for Red Cross traffic between these cities and Onondaga Co. Red Cross Hq. Remember the Western New York Hamfest May 21st, sponsored by the RARA, at Dowd Post, American Legion, Route 31, West of Rochester City Line. KN2s JTT and LXB are new stations on 2 meters. UHI, PPL, JUL, and AFY are on s.s.b. UTH has a "V" beam directed at Europe. CZT has a new s.s.b. RCA is active on 15-meter 'phone working Gs, Fs, and ONS with 60 watts. PPR remote controls his rig from the bedroom. GUR dropped the "N." KWF is a new call in Rochester. At the RARA "Ladies Nite" meeting C. A. Kinsley, of Eastman Kodak, spoke on "Traveling with your Color Camera," and QCF on Color TV. Traffic: (Jan.) W2RUF 521, ZRC 160, DXV 150, OE 117, DSS 59, K2DSR 36, DJN 36, W2UTH 21, Q1HH 20, RQF 20, FEB 12, K2CUQ 11, W2EMW 5. (Dec.) W2DXV 120, GBX 56, LXE 54, CPN 4.

**WESTERN PENNSYLVANIA**—SCM, R. M. Heck, W3NCU—SEC: GEG, RMs: UHN, GEG, and NUG. PAMs: AER and LXE. The W. Pa. Traffic Net meets at 7 p.m. 3555 kc. and reports for January show 241 stations reporting and 108 messages handled. In the Pennsylvania County QSO Contest, sponsored by the Western Pennsylvania Amateur Radio Club Council, top scorers and award winners were KUN, State award; GJY, Western Penna. award; and ANA, Eastern Penna. award. The RAE is starting its second session of code and theory classes at the YMCA. On 10 meters are RVG, YKE, and YWL. OIH visited LIT and tried out his 75-meter s.s.b. YKE's brother, Doug, and pal, VNB, have joined the USAF. Guests at a recent RAE meeting were IKW and 8BDV. The MCRA's code classes, conducted by GEG assisted by other club members, are attended by approximately 40 persons. The South Hills Brass Pounders and Modulators elected QNI, pres.; QWW, vice-pres.; LDB, secy.; WFR, treas. VKS, the hamfest chairman, has high hopes of making the Aug. 7th affair the best ever. OUG is on 10 meters. 8UMR is putting up a 60-ft. mast for 10- and 15-meter antennas. KLP is a 10-meter fan. WEJ is on 10 and 40 meters. QYF and NCP both have 62-ft. masts and are on 10 meters. SJK worked Alaska on 15 meters. KKY is on 40 meters. The Breeze Shooters Net meets Mon. at 8 p.m. on 29 Mc. and has a hamfest scheduled for May 22nd. The Bucktail Amateur Radio Club (YDW) Net meets Mon. at 6:30 p.m. on 29,080 kc. WHO resigned as vice-president and SUL will fill the balance of the term. WEL is on 80-meter c.w.; RMX is 10-meter mobile; TCP is building test equipment, also radio-controlled planes; NMJ is on 80-meter c.w.; RVS, Cameron County EC and c.d. Radio Officer, is sporting a new Ranger; KUN is on 80-meter c.w.; SUL is mobile on 10 and 80 meters; TYC was active in the YLRL C.W. Contest; HIX is hard at work on 15-meter dipole, crystal grinding, s.s.b. exciter and various projects for the club station, YDW. ZKY has the Naval Reserve call N4KHB. OGN is recovering from an operation. NGZ is completing a crystal 10-meter converter. WIL, on 40 meters, has finished a cathode modulator with 6S17/6Y6. VEE is building a crystal calibrator. Traffic: W3WJQ 1753, LMMI 267, OEZ 99, LXQ 92, YA 76, UHN 59, KUN 56, VKD 24, NMJ 23, GJY 20, NCD 19, NUG 18, KNQ 15, UTR 10, AEV 6, SIJ 6, UTX 4, PWN 2.

## CENTRAL DIVISION

**ILLINOIS**—SCM, George T. Schreiber, W9YIX. Section nets: ILN c.w., 3515 kc. Mon. through Sat.; IEN 'phone, 3940 kc. RMs: BUC and MRQ. PAMs: UQT, EC; HOA. EC Cook County: HPG. Club elections: Hamfesters—GVO, pres.; PCB, vice-pres.; YNV, treas.; IGC, fin. secy.; IWR, sgt. at arms; EGY, rec. secy.; WOL, FCO. AVH, KNP, and DKA, directors. Tri-Town Amateur Radio Club—ABI, pres.; KIKN, secy.; and Novice FRZ, treas. Oak Park and River Forest Amateur Radio Club—BWV, pres.; KOR, secy.; KAJ, treas.; and ZFH, act. mgr. AA built up a suppressor grid modulator for his RK-20 for

a little 'phone ragchewing. SXL did some shielding on his TV set and killed a lot of QRM to his ham rig. He received his Old Timers Club certificate. We hear the gang in Peoria has started a city net on 1883 kc. An ILN contest is needed there, fellows, and we will carry your traffic out. GUW, ODT, and AQP are enthusiastic boosters of s.s.b. and plan higher power. HJS sticks to lower-powered mobile and has fun. New Novice calls are LYB and LYC. New OOs are ERU, PVD, and KKN. DO, AA, and K9FCA made BPL. USI is working hard at his OBS duties, both on 40 and 2 meters, with good response from his "customers." FRP and GBT renewed OPS appointments; the latter has had continuous service since 1938. FRP, SME, CEE, and YIX renewed ORS appointments. VVJ is rebuilding his rig and enjoys IEN. Our sympathy to ICF, who lost his mother. BA is NCS and KPW alternate for the 10th Air Force MARS Net. A group of the after-midnight ragchewers on 40-meter 'phone sprang a surprise visit on DA. They included BNZ, ZGV, QBB, MCM, ERR, and TNH. PHE had a little beam trouble. DRN deplores the fact that there are so few stations on 432 Mc. So far he has heard and worked AGM, ZQ1, and EFD. OO TALL observes that some of us are getting careless with out-of-band operation on 160 meters. KN2KNI/9, stationed at the Ground Observers Detachment in Chicago, is the first Novice "K" call we have heard from. BRD is changing QTH again. Watch for it at the heading of his DX column. SKR still is experimenting with loaded dipoles. Congrats to NIU on the new jr. operator. KQK built a citizen's band transmitter for a neighborhood juvenile to control a boat model. EYG was issued certificate No. 62 by the St. Clair Amateur Radio Club for working ten St. Clair County stations. KQL is the new trustee for the Sangamon Valley Radio Club station. He, with PRN, GOJ, and ERC, have established a strictly walkie-talkie defense net in Springfield. CQC has gone to a kw. on all bands, including DX. PXT, stung by inactivity, built a Heathkit rig to keep his hand in. OAL is teaching the XYL the code. YLU enjoys 160 meters with an Elmac. MTQ finally licked the parasites and now is on all bands with an 813. Fifteen meters looks good to GTI and he and EWR have a contest all their own. JEC says his rig for 420 Mc. looks like part of a space ship. ULB is going to write President Ike regarding TV sets causing trouble to his ham rig. NN is running out of wall space for certificates. His latest is D.U.F. Amateurs in the northwest suburbs of Chicago are checking a Novice who drops the "N" in his call and slips into the forbidden portions of the band with a VFO. YIX is accused of having ghost writers of this dope. But it isn't true, fellows; send in your items not later than the fifth of the month and see. PGW gets better reports, he claims, from his mobile rig than ATH does on his home equipment. Traffic: (Jan.) W9DO 1074, K9FCA 907, W9AA 244, IDA 149, USA 118, SME 77, OR 56, QQG 44, STZ 31, LXJ 29, VHD 28, YIX 27, MRQ 25, BUK 18, FRP 16, PHE 12, BRD 11, BA 8, HFG 4, NIU 2. (Dec.) W9IDA 316, OR 218, UVM 17.

**INDIANA**—SCM, George H. Graue, W9RKJ—Section Nets: IFN 3910 kc. daily 0900 and 1730 CST; QIN 3656 kc. Mon. through Sat. 1600, 1730, and 2200 CST; RFN 3656 kc. Sun. 0900. CYC is at the helm again with an entire new station. IUJ is active over three nets. NZZ still is QRL with Arctic skeds. IJ received a BPL medalion. SIQ/9 has a new Viking II with VFO. WWT has applied for OBS appointment. WRO's modulator transformer blew up again. QYQ has a new s.s.b. exciter. AYP and JWI have new Johnson mobile rigs. DOK was host to an Explorer B. S. Troop. RBX took the commercial class exams. GDL is the cabin station of STFC. AZH is on 75-meter 'phone. DKR has a new VFO. HLY is working 20 meters with cubical quad per Jan. QST. DGA enjoyed his first CD 'Phone Party. NHI still is working DX on 160 meters. PPS is one of the operators at YB. UNT received a Viking II for Christmas. HMR is assembling a Viking II. IOH reports there is ham gear on 147.3 Mc. at State Police Post at Charleston for c.d. work. CCARG officers are LSG, pres.; DKC, vice-pres.; IRT, secy.-treas. IRT is Clark County EC. DFW, HRY, LSG, IRT, and WNI have new rigs on the air. N9NHV is new in Jeffersonville. Mike and Key Club officers are UWT, pres.; UVD, vice-pres.; VCA, secy.-treas. FXY, Martinsville High School station, assisted for exams N9NF, NCK, and NPS. ISC is new at Columbia City. New at Sullivan is RAM. BSZ has resigned as EC for Grant County. DNA donated a ditto machine to the LCARC for club bulletins. ZYP built a new VFO. Newly-elected officers of TARS are DGA, pres.; UMS, vice-pres.; OVB, secy.; and RBV, treas. TARS's new meeting place is at the Community Center, Eighth and Main St. HQF has 127 confirmed on DXCC. DGA has 123, and EHU has 96. DPE is headed for K7-Land. ZZY is rebuilding. DLACT-9MXE was named Airman of the Month in DL-Land. DIR has been nominated for Air Academy at Denver. FFH is an ensign in the Navy. RIV has new 75A-3. LDB is trying to organize a club at the high school in Elwood. DQI has dropped the "N" and is 2-meter mobile. CKD is new in Indianapolis. IIMS has dropped the "N." N9LCQ is new in Griffith. WKN is building a new final. ACN has a new Sky King. EIHZ is building an s.s.b. slicer. OFD has a new 500-watt final. WWT reports total traffic for RFN as 195; YIP for IFN with a total of 182. Traffic: W9JUL 1537, NZZ 1193,

(Continued on page 84)

## WHAT IS A MICROVOLT?

A MICROVOLT of r.f. across the antenna terminals produces an audible and quieting carrier on a sensitive receiver (A) under laboratory conditions with a signal generator producing the microvolt. The receiver is then placed in an amateur station.

A less sensitive receiver (B) in the same station under identical operating conditions produces a quieter and more audible received signal than receiver (A).

What is the difference? The noise figure could be better in (B) but when measured (A) is found to be superior.

The answer, of course, is selectivity. Consider a segment of frequency with a signal in its center. (Fig. 1) The grass on both sides of the signal is noise, mainly man-made and well above the thermal noise of the first r.f. stage.

Fig. 1

Consider selectivity as a window. The narrower the window, the greater the selectivity. By placing the signal in the center of the window, receivers (A) and (B) are Figures 2 and 3 respectively.

Fig. 2

Fig. 3

Receiver (A) window contains the wanted signal plus a lot of useless noise. (B) window contains mainly signal. (B) will have the greater operating sensitivity, since most of its accepted spectrum is signal.

Below 30 Mc. the noise figure of a receiver is seldom realized due to man-made noise. Selectivity, therefore, is the important function in the majority of cases with the noise figure, not so important.

At UHF noise figure is a good measure of operating sensitivity since a given receiver may utilize its i.f. gain until the amplified thermal noise of its own first stages becomes objectionable. Man-made noise at these frequencies is low enough to permit this condition.

The criterion then for a good communications receiver becomes one of excellent selectivity with sensitivity or noise figure of secondary importance, depending upon the operating frequency.

## a new concept in linears

CENTRAL ELECTRONICS takes pride in presenting a product of intensive research — the new Multiphase 600L Broad-band\* Linear. "It is destined to change the entire concept of RF amplifier design in the military, commercial and amateur fields." There are no tuning controls, servos or moving parts other than band-switch.

- Single 813 in Class AB<sub>2</sub>.
- New band-pass couplers provide high linear efficiency: 60 to 65%.
- Designed for 50 — 70 ohm co-axial input and output.
- Easy to drive — Approx. 2 watts effective or 4 watts peak drive power required for 500 watts DC input.
- Built-in power supply — bias and screen regulation, 45 mfd. oil filled paper output capacitor. Excellent static and dynamic regulation.
- Extremely low intermodulation distortion.
- Automatic relay protects 813 and RF couplers.
- Excellent stability — complete freedom from parasitics.
- Effectively TVI suppressed — RF compartments thoroughly shielded and Hypassed.
- Choice of grey table model, grey or black wrinkle finish rack model.
- Table model cabinet size — 17 $\frac{1}{2}$ " W, 8 $\frac{3}{4}$ " H, 13" D.

**CENTRAL ELECTRONICS**

**MODEL AQ**

**MODEL DQ**

**MODEL B SLICER**

## NEW MULTIPHASE "Q" MULTIPLIER AVAILABLE THREE WAYS

1. It's built-in the new Model B Sideband Slicer.
2. Plug it into your present Model A Slicer.
3. Attractive Desk Model, for installation directly into receiver.

The new Multiphase "Q" MULTIPLIER is a tunable IF electronic filter that provides tremendous receiver selectivity for peaking or rejecting a signal on AM, CW or SSB. It employs a new two tube circuit\* with a special very high "Q" pot core inductor. Continuously variable selectivity from 60 cps to normal IF pass-band. Nulls out interfering heterodynes without affecting speech intelligibility. Peak the desired signal; interfering carriers are attenuated up to 50 db.

\*PATENT PENDING

**MODEL 20A**

- 20 Watts Peak Envelope Output SSB, AM, PM and CW
- Completely Bandswitched 160 thru 10 Meters
- Magic Eye Carrier Null and Peak Modulation Indicator

Choice of grey table model, grey or black wrinkle finish rack model.

Wired and tested.....\$249.50  
Complete kit.....\$199.50

### 458 CONVERSION KIT

Basic 458 Conversion Parts Kit, 15 to 160 meters, with dial, etc. ....\$15.00  
458 Deluxe Case and Panel Kit, matches size and appearance of Slicer...\$10.00

### NEW — FOR 10 METERS

MODEL 458-10 xtal controlled converter package to extend 458 VFO into 10 meter band. For use with above 458 Conversion Kits.

Wired.....\$37.50  
Kit.....\$27.50

## MODELS MODEL AQ

"Q" MULTIPLIER for installation in Model A Slicer. Includes new front panel. Power-IF cable plugs into accessory socket.  
Wired...\$29.50 Kit...\$22.50

## MODEL DQ

Desk Model "Q" MULTIPLIER for use with any receiver having 450 to 500 KC IF. In attractive case 5 1/2" W, 4" H, 5" D, with connecting power-IF cable. Power requirements, 225 to 300 VDC at 12 ma., 6.3 V at .6 amps, can be secured from receiver. Can provide added selectivity and BFO for mobile SSB or CW reception.  
Wired...\$29.50 Kit...\$22.50

## MODEL B

Sideband Slicer, same as Model A Slicer but includes built-in "Q" MULTIPLIER. AP-1 not needed.  
Wired.....\$99.50  
Kit.....\$69.50

## Check These Features NOW IN BOTH MODELS

- Perfected Voice-Controlled Break-in on SSB, AM, PM.
- Upper or Lower Sideband at the flip of a switch.
- New Carrier Level Control. Insert any amount of carrier without disturbing carrier suppression adjustments.
- New Calibrate Circuit. Simply talk yourself exactly on frequency as you set your VFO. Calibrate signal level adjustable from zero to full output.
- New AF Input Jack. For oscillator or phone patch.
- CW Break-in Operation.
- New Gold Contact Voice Control Relay. Extra contacts for muting receiver, operating relays, etc.
- Accessory Power Socket. Furnishes blocking bias for linear amplifier and voltage for optional VFO (Modified BC458 makes an excellent multiband VFO.)
- 40 DB or More Suppression of unwanted sideband.

## SIDE BAND SLICER

### MODEL A IMPROVES ANY RECEIVER

Upper or lower sideband reception of SSB, AM, PM and CW at the flip of a switch. Cuts QRM in half. Exalted carrier method eliminates distortion caused by selective fading. Easily connected into any receiver having 450-500 KC IF. Built-in power supply. Reduces or eliminates interference from 15 KC TV receiver sweep harmonics.

Wired and tested.....\$74.50  
Complete kit.....\$49.50

## AP-1 ADAPTER

Plug-in IF stage—used with Slicer, allows receiver to be switched back to normal.

Wired and tested, with tube....\$8.50

## NEW AP-2 ADAPTER

Combined AP-1 and xtal mixer. Allows Slicer to be used with receivers having 50, 85, 100, 915 KC and other IF systems. One xtal suffices for most receivers. \$17.50

## MODEL 10B

### SUCCESSOR TO THE POPULAR MODEL 10A

- 10 Watts Peak Envelope Output SSB, AM, PM and CW
- Multiband Operation using plug-in coils.

Choice of grey table model, grey or black wrinkle finish rack model. With coils for one band.

Wired and tested.....\$179.50  
Complete kit.....\$129.50

## QT-1 ANTI-TRIP UNIT

Perfected Voice Operated Break-in with loudspeaker. Prevents loud signals, heterodynes and static from tripping the voice break-in circuit. All electronic — no relays. Plugs into socket inside 20A or 10B Exciter.

Wired and tested, with tube....\$12.50

# Mosley "VEST POCKET"

## ROTARY BEAMS

**"in compact beams quality counts!"**

- PRE-TUNED
- QUALITY COMPONENTS
- EASY ASSEMBLY
- PROVED PERFORMANCE

*The "V-P" Beam design was originally described in May '54 QST and is featured editorially in 1955 ARRL HANDBOOK.*

MOSLEY beams are designed FOR HAMS — BY HAMS. They are made as small as possible and still maintain true beam performance. Correctly proportioned element length to coil inductance results in high forward gain, good front-to-back ratio, negligible end-fire and low SWR over the entire band.

Every part of a MOSLEY "V-P" Beam is designed for heavy duty service in all kinds of weather. Although every model but the 40 meter beam can be supported with a TV rotator, MOSLEY beams are no flimsy, light-weight weaklings. Aluminum elements pre-cut, pre-drilled, pre-tuned and color coded. One piece aluminum boom. All non-

ferrous parts plated. Heavy varnished red-wood cross arms can't cause distortion of beam pattern. Shipped "knocked down" but assembly is quick and simple. Each model complete with coils and all parts. Ask your jobber, listed below, for free copy of MOSLEY Catalog H55 giving complete electrical and mechanical data.

### MOSLEY 2 ELEMENT 40 METER BEAM

Model #VPA 40-2. Forward gain: 5db. Front-to-back ratio: 19 db. SWR: 1.07 to 1 at resonant frequency. . . . . \$74.95

### MOSLEY 3 ELEMENT 20 METER BEAM

Model #VPA 20-3. Forward gain: 7.5 db. Front-to-back ratio: 28 db. SWR: 1.05 to 1 at resonant frequency. . . . . \$79.95

### MOSLEY 2 ELEMENT 20 METER BEAM

Model #VPA 20-2. Forward gain: 6db. Front-to-back ratio: 20 db. SWR: 1.2 to 1 at resonant frequency. . . . . \$55.95

# "SECRET" OF MOSLEY BEAM PERFORMANCE

**Is The Superior Materials And  
Construction Of The Loading Coils**

MOSLEY coils are machine-wound on forms of the highest grade ceramic. No loose hand-wound turns that slip and change inductance to ruin beam performance. For added protection, MOSLEY coils are also enclosed in weather-proof covers so that hot or cold — wet or dry, you get the same fine performance. They stay tuned on the nose — handle a Kilowatt with ease! Link coupling to radiator coil matches 52 ohm coax line.

Poorly constructed loading coils are false economy if it's enduring beam performance that you want! Compare MOSLEY quality, materials and workmanship. See them at your distributor or write for brochure.

# AT YOUR DEALERS

## APC Capacitors With E-X-T-E-N-D-E-D Shafts

In response to many requests from amateurs, experimenters and electronic equipment builders, Hammarlund is now offering APC — B Type, and MAPC — B Type Capacitors as standard items through Hammarlund Authorized Dealers.

These are extended-shaft versions of the well-known APC and MAPC capacitors. They permit knob-control or shaft coupling.

The original APC trimmer was designed and first produced by Hammarlund more than 20 years ago, and is used in all classes of equipment where a compact high-quality air dielectric trimmer is needed. The MAPC type is similar to the APC except that it is a miniaturized version.

Range of the APC series is from 3 to 140 mmf and for the MAPC, 2.3 to 100 mmf.

For your free copy of the Hammarlund Capacitor Catalog, which gives listings of the complete line of standard capacitors, write to The Hammarlund Manufacturing Co., Inc., 460 West 34th Street, New York 1. Ask for Bulletin C4.

**WISCONSIN** — SCM, Reno W. Goetsch, W0RQM — SEC: OVO, PAMS: ESJ and GMY, RMs: IXA, RTP, and UNJ. Nets: BEN, 3950 kc., 6 p.m. daily; WIN, 3625 kc., 6 p.m. daily; WPN, 3950 kc., 1215 Mon-Sat, 0930 Sun, Wisconsin mobile and c.d. frequency: 29,620 kc. WIN operation was moved up to 5:30 p.m. to beat the long skip. VBZ has a new "short" beam for 14 Mc. ESJ has been toying with a 616 on 432 Mc. Net certificates (BEN) were issued to OVE and HHJ. We trust that by this time IXA has recovered from the attack of virus pneumonia which put him out of business for a while. CCO now has coax feed on his 80-meter antenna. UTV has a new c.w. rig with 80 watts to a pair of 807s, 80-meter DX worked by RKP includes PA0, DLI, G, VPI, KV4, KP4, VP7, and ZL. RQK is looking for Wisconsin stations on 14-Mc. "phone while at school in New Jersey. QXE moved to Minnesota and is now a W0. Net certificates (WPN) were issued to LEE, LUQ, FXW, BTN, and YFU. SAA reports 1049 QNI in December. New officers of the Racine Racecycle Club are BVG, pres.; LXV, vice-pres.; YZA, secy.-treas. They plan to equip the Racine six agency c.d. truck with gear for RACES operation. The M. & M. Club held its Charter Night party Jan. 29th. CCO is now NCS on WIN Wed. SZL is director of communications for Racine c.d. SDK has a new SX-96 receiver, FCF QSOed ZHE/MI in Madison via 61JU on 21 Mc. FLARC (Madison) elected as new officers RBL, pres.; LNM, vice-pres.; YWI, secy.; MQK, treas.; and DIG, INO, and HHR, directors. LHR has a B7 W 5100 transmitter and HQ-140X receiver. OVO has been working 21 Mc. with his mobile. Traffic: W9VBZ 557, ESJ 232, CXY 176, IXA 67, SAA 63, CCO 59, RTP 57, UIM 50, UTV 24, LAG 19, FFC 9, RQM 9, GMY 8, IQW 8, HU 7, KWJ 6, RKP 5, SZR 3, OVO 2, RQK 1.

## DAKOTA DIVISION

**NORTH DAKOTA** — SCM, Earl C. Kirkeby, W0HNV — The Lake Region Amateur Radio Club at its last regular meeting formulated plans for a code and theory class for Novices, to be held in Devil's Lake. The members also are working on a club 2-meter project. We wish them much luck as there is very little 2-meter activity in the State at present. The Sioux Amateur Assn., at Grand Forks, has purchased a kw. transmitter from a government agency and is busy converting it to the ham bands. We are sorry to say that this will be our last report as SCM. We just don't have the time to devote to the job that it deserves. Thanks to all those faithful boys who reported every month. Traffic: W0FVC 37, BFM 11.

**SOUTH DAKOTA** — SCM, J. W. Sikorski, W0RRN — Asst. SCMs: Earl Shirley, 0YQR, and Martha Shirley, 0ZWL. SEC: GCP, PAMS: GDE, BNA, NEO, and PRL. RM: SMV, DVB and EQN registered with the AREC from Lead. SMV won the SFARC 7-Mc. WAS Contest, with HON, BLZ, PHR, RRN, OOO, and RWE also winning prizes. Officers for '55 of the Prairie Dog ARC are HFE, pres.; ZVY, vice-pres.; EUJ, secy.-treas.; THF, chief operator; RLA, custodian; GDE, publicity; SCT, editor. The PDARC received an inquiry about its "Who's Who in South Dakota Hamdom" from England. Net activities for January: 160-net, 30 sessions, 838 QNI, traffic 98; C.W.-Net, 13 sessions, 113 QNI, traffic 50; 75-Net, 30 sessions, 1010 QNI, traffic 113; NJQ-Net, 24 sessions, 628 QNI, traffic not reported. DES is back on the air with a Ranger after many years absence. UVL has a new daughter — his first "harmonic." North Hills hams have formed a new club, with AEN, pres.; Merle Reese, vice-pres.; DVB, secy.; and Arne Sjomelung, treas. Traffic: W0SMV 59, MPQ 42, BLZ 41, SCT 41, PHR 11, OOO 7, BQS 6, DVB 6, RSP 6, RRN 4.

**MINNESOTA** — SCM, Charles M. Bove, W0MNC — KJZ now has worked all states on 80-meter c.w. TMZ's wife is now WN0ZR. YNY is located in Dawson and is on 75 meters. Albert Lea reports 4 new hams, WN0BZY, ZBL, ZJC, and ZLR. VEZ, at Murdock, bought JDO's old transmitter and JDO bought LVG's rig. The MJN Junior Slow-Speed Net on 3690 kc. changed time to 1700 CST. While we are mentioning nets, you can check into the MSN C.W. Net on 3595, MJN on 3690 kc. at 1800 and the MSN "Phone Nets on 3820 kc. at 1205 and 1800 CST. The Mesabi Net meets on 1895 kc. at 1900 on Mon. and Fri. EQS is going into the Navy. TYV and OJP have dropped the "N" from their calls. PBL is sporting a new Gonset 500-watt final on his 10-A s.s.b. rig. Your SEC, GTX, now has 417 AREC members signed up. Out of this group there are 140 mobiles. George is to be commended for the fine job he has done as Emergency Coordinator. The St. Cloud Mike and Key Club has been reactivated and meets the 3rd Mon. of each month at 7 p.m. For meeting place call RVO, Phone 2986, and ask for Bob. HPS and his XYL, PYC, are moving to

(Continued on page 86)

# THE HQ-140-X...

## HAS "MORE THAN MEETS THE EYE"!

Just looking at the outside of an HQ-140-X communications receiver isn't enough, when you're in the

market for a new rig. Sure, it's in an attractive case that's built for rugged service; and the controls are comfortably placed for lengthy DX operations. But, it's what's inside the cabinet that's important.

For example, the HQ-140-X offers a professional-type tube lineup. The use of a separate mixer (6BE6) and oscillator (6C4) contribute to the high degree of oscillator stability. Modern 6BA6's are used for the RF amplifier and for all three stages of IF amplification for maximum efficiency.

The nine individual sections of the band-spread capacitor, and the six sections that make up the main tuning capacitor, at all times maintain the proper L/C ratio regardless of what part of the receiver's range (540 Kc to 31 Mc) you use. Plates are heavy brass, soldered to their shafts, built into a large sturdy frame for rugged use.

Features like those described above rate high with 'hams' the world over. For detailed information on the HQ-140-X, write to The Hammarlund Manufacturing Co., Inc., 460 West 34th Street, New York 1, New York. Ask for Bulletin R4.

**HQ-140-X  
Top View**

**Sectionalized Tuning  
Capacitor Assembly**

# HAMMARLUND

SINCE 1910

## Heathkit GRID DIP METER KIT

The invaluable instrument for all Hams. Numerous applications such as retuning, neutralization, locating parasites, correcting TVI, adjusting antennas, design procedures, etc. Receiver applications include measuring C, L and Q of components—determining RF circuit resonant frequencies.

Covers 80, 40, 20, 11, 10, 6, 2, and 1½ meter Ham bands. Complete frequency coverage from 2–250 Mc, using ready-wound plug-in coils provided with the kit. Accessory coil kit, Part 341-A at \$3.00 extends low frequency range to 350 Kc. Dial correlation curves furnished.

Compact construction, one hand operation, AC transformer operated, variable sensitivity control, thumb wheel drive, and direct reading calibrations. Precalibrated dial

with additional blank dials for individual calibration. You'll like the ready convenience and smart appearance of this kit with its baked enamel panel and crackle finish cabinet.

MODEL GD-1B

**\$19.50** Ship. Wt.  
4 lbs.

## Heathkit ANTENNA COUPLER KIT

The new Heathkit Antenna Coupler Model AC-1 was specifically designed to operate with the Heathkit Amateur Transmitter and will operate with any transmitter not exceeding 75 watts RF input power. Rugged design has resulted in a sturdy, well shielded unit featuring a copper plated chassis and shield compartment. Coaxial 52 ohm receptacle on the rear of the chassis connects

to a three section Pi-type low pass filter with a cut-off frequency of 36 Mc. Tuning network consists of a variable capacitance and tapped inductance in an impedance matching unit.

Capacitively coupled neon lamp serves as a tuning indicator and will also provide a rough indication of power output.

MODEL AC-1

**\$14.50** Ship. Wt.  
4 lbs.

## Heathkit IMPEDANCE METER KIT

MODEL  
AM-1

The Heathkit Antenna Impedance Meter is basically a resistance type standing wave ratio bridge, with one arm a variable resistance. In this manner it is possible to measure radiation resistance and resonant frequency and antenna transmission line impedance; approximate SWR and optimum receiver input. Use it also as a monitor or as a field strength meter where high sensitivity is not required. Frequency range of the AM-1 is 0–150 Mc and range of impedance measurements 0–600 ohms. The circuit uses a 100 microampere Simpson meter as a sensi-

tive null indicator. Shielded aluminum light weight cabinet. Strong self supporting antenna terminals.

**\$14.50** Ship. Wt.  
2 lbs.

**HEATH COMPANY**  
BENTON HARBOR 9, MICHIGAN

Mahtomedi. The 1954 Ten Thousand Lakes QSO Party was a success. Twenty-three certificates have been issued. The three highest scoring stations in Minnesota were HAH, KJZ, and LUX. Rodolfo Montero, who attended school in Minnesota and is a good friend of LUX, returned to his home at Vigan-Ilocos Sur in the Philippine Islands. Rodolfo has a burning desire to be a ham. To help him out LUX gave him a Heathkit receiver and Gonset code oscillator with key and also sent about \$130 in assorted gear. Traffic: WOKLG 221, KFN 106, QBW 105, HIN 104, WMA 96, QNY 85, DQJ 78, HUX 57, RVO 57, IRJ 54, GTX 41, TQQ 32, UCV 32, RQJ 26, TXN 25, TUS 23, QDP 22, EHO 20, LST 20, BZG 19, GGO 19, HMC 18, ABA 11, BUO 11, CLO 9, KNR 9, NTV 9, ALW 8, HNV 8, LUX 8, QGD 8, ZTB 7, OPA 6, VOA 6, FIT 5, WAA 1.

### DELTA DIVISION

**ARKANSAS**—SCM, Owen G. Mahaffey, W5FMF—SXM reports he has his Extra Class license. Congratulations, Grover, MSH is RM and is trying hard to get the c.w. net going. New appointments: LUX, MRD, and DRW as ECs; MSH and LUX as ORSs; BAB as OBS, TNM, EVB, and BAB paid us a visit. We're always glad to see you. WN5FBG is a new ham in Clarksdale. LUX has a new modulation transformer and will be on with a new 'phone rig soon. LRE writes that he is in charge of telephone service in Frankfurt, Germany. CAF says he is recuperating from both an illness and a fire and will be back on the net soon. Traffic: W5MSH 555, FMF 25, PX 6, LUX 1, SXM 1.

**LOUISIANA**—SCM, Thomas J. Morgavi, W5FMO—The Single Sidesband Dinner staged at a famous New Orleans restaurant was a huge success. Among those attending were HHT, TDY, IMT, IMU, ABS, VEU, UKQ, ZSP, ZNI, DLA, LFF, and SUM. LFF and SUM visited your SCM the morning after their whirlwind tour of the French Quarter. WQP is a proud pappy, a girl. She modulates his Viking better than Jerry. NDV meets with NTS, RN5, CAN, CFN, and TXN to continue as high scorer for Louisiana. DGB has been down with the flu but is up and around again. GXO was in the hospital for an operation but is on the road to recovery. FMO lost part of his 20-meter beam during a recent windstorm. He is building a new secondary standard consisting of a 100-ke. unit in a double oven and multivibrators for 100, 10, 1 and .1 kc. KHX is plagued with r.f. in the wrong places. SPZ made a tape recording of the last CD Test which was played back at a recent meeting of the Greater New Orleans ARC. It brought out to a lot of us our mistakes on net procedure along with some good points. An emergency net is being formed in New Orleans. Meeting time is 9:00 A.M. Sun. on 3825 kc. All AREC members are requested to report in at that time. Address queries in reference to this net to UQK or FMO. Four station activities report cards were received this month and that accounts for the lack of out-of-New Orleans news. Please send in your reports so that they are received not later than the 4th of the month. Traffic: W5NDV 92, EA 27, VIC 18, FMO 10.

**TENNESSEE**—SCM, Harry C. Simpson, W4SCF—SEC: RRV, PAM: PFP, RM: WQW. Congratulations to IIB on making DXCC with a maximum of 150 watts. WQW and PFP request more net attendance, although John still is enthused over the fifty stations who checked into the 'phone net one recent Sun. morning. CXY is doing a grand job as NCS of the new Novice Net which meets Mon., Wed., and Fri. at 1900 EST on 3737 kc. All Tennessee Novices are invited to participate. WQT has a new Slicer, and reports five new Novices in the Clarksville Area. OEZ reports on the Davidson County 2-meter Net, which now has 23 members in the Nashville Area. FUY has a new sixteen-element beam. The usual fine bulletin was received from the Upper Cumberland Net. PVD's DX score now is 113/90. UWA has a new VFO, VJ, IV, and UWA are new ORSs. Orchids to BER, PVD, ZJY, UWA, and the Cookeville Club for their fine publicity in newspapers concerning their emergency activities. TYU sent nice clippings and pictures with stories on Knoxville-Knox County activities, and a fine feature on the wonderful services TZD has performed for service personnel. FCD Regional Head YB, along with YEL and SCF, spoke to a full house at the Memphis Club. VKE, now at Northwestern, writes that he looks forward to QSOs over the school station, 9GBX. New Nashville Club officers are WHM, pres.; PRY, vice-pres.; and APH, secy-treas. RRV reports more links in the 6-meter state chain, with APJ at Crossville and BXP at Harriman. Traffic: (Jan.) W4PL 743, OGG 334, TYU 248, ZJY 222, PFP 129, PVD 110, TZD 80, IIB 78, PQP 73, WQW 66, SCF 59, HHI 57, UWA 54, RRV 44, VJ 41, BQG 40, CXY 34, IV 34, YMB 34, BHI 20, OEZ 16, UVS 14, APD 13, BBD 11, BAQ 10, PAH 8, RHK 8, FLW 6, UOA 5, DCH 4, Z 3, GFV 2, HX 2, IUT 2, UDI 2, NPS 1. (Dec.) W4ODR 110, UVS 26, WQT 21.

### GREAT LAKES DIVISION

**KENTUCKY**—SCM, Robert E. Fields, W4SBI—ZLK reports that he burned out his low-pass filter. YOK worked W6s HP and ELS on 80 meters. JCN is getting

(Continued on page 88)

# New Heathkit VFO KIT

MODEL VF-1

**\$1950**

Ship. Wt. 7 lbs.

- Smooth acting illuminated and precalibrated dial.
- 6AU6 electron coupled Clapp oscillator and OA2 voltage regulator.
- 10 Volt average output on fundamental frequencies.
- 7 Band calibration, 160 through 10 meters, from 3 basic oscillator frequencies.

Here is the new Heathkit VFO you have been waiting for. The perfect companion to the Heathkit Model AT-1 Transmitter. It has sufficient output to drive any multi-stage transmitter of modern design. A terrific combination of outstanding features at a low kit price. Good mechanical

and electrical design insures operating stability. Coils are wound on heavy duty ceramic forms, using Litz or double cellulose wire coated with polystyrene cement. Variable capacitor is of differential type construction, especially designed for maximum bandsread and features ceramic insulation and double bearings.

This kit is furnished with a carefully precalibrated dial which provides well over two feet of calibrated dial scale. Smooth acting vernier reduction drive insures easy tuning and zero beating. Power requirements 6.3 volts AC at .45 amperes and 250 volts DC at 15 mills. Just plug it into the power receptacle provided on the rear of the AT-1 Transmitter Kit. The VFO coaxial output cable terminates in plastic plug to fit standard 1/4" crystal holder. Construction is simple and wiring is easy.

Open layout—easy to build—simplified wiring.

Smooth acting illuminated dial drive.

Clean appearance—rugged construction—accessible calibrating adjustments.

Ceramic coil forms—differential condenser.

Copper plated chassis—careful shielding.

## Heathkit AMATEUR TRANSMITTER KIT

MODEL AT-1

**\$2950**

Ship. Wt. 16 lbs.

### SPECIFICATIONS:

Range 80, 40, 20, 15, 11, 10 meters.  
6AG7 ..... Oscillator-multiplier.  
6L6 ..... Amplifier-doubler.  
5U4G ..... Rectifier.  
105-125 Volt A.C. 50-60 cycles 100 watts. Size: 8 1/4 inch high x 13 1/2 inch wide x 7 inch deep.

Crystal or VFO excitation.

Here is a major Heathkit addition to the Ham radio field, the AT-1 Transmitter Kit, incorporating many desirable design features at the lowest possible dollar-per-watts price. Panel mounted crystal socket, stand-by switch, key click filter, A. C. line filtering, good shielding, etc. VFO or crystal excitation—up to 35 watts input. Built-in power supply provides 425 volts at 100 MA. Amazingly low kit price includes all circuit components, tubes, cabinet, punched chassis, and detailed construction manual.

Rugged, clean construction.

Prewound coils—metered operation.

52 ohm coaxial output.

Single knob band switching.

Built-in power supply.

## Heathkit COMMUNICATIONS RECEIVER KIT

Four band operation 535 to 35 Mc.

Stable BFO oscillator circuit.

RF gain control with AVC or MVC.

5 1/2 inch PM Speaker-Headphone Jack.

Six tube transformer operation.

Electrical bandsread and scale.

Noise limiter—standby switch.

### SPECIFICATIONS:

Range.....535 Kc to 35 Mc  
12BE6 ..... Mixer-oscillator  
12BA6 ..... I. F. Amplifier  
12AV6 ..... Detector-AVC—audio  
12BA6 ..... B. F. O. oscillator  
12A6 ..... Beam power output  
5Y3GT ..... Rectifier  
105-125 volts A.C. 50-60 cycles, 45 watts.

A new Heathkit AR-2 communications receiver. The ideal companion piece for the AT-1 Transmitter. Electrical bandsread scale for tuning and logging convenience. High gain miniature tubes and IF transformers for high sensitivity and good signal to noise ratio. Construct your own Communications Receiver at a very substantial saving. Supplied with all tubes, punched and formed sheet metal parts, speaker, circuit components, and detailed step-by-step construction manual.

**HEATH COMPANY**  
BENTON HARBOR 9, MICHIGAN

ready to go to 160 meters for a KYN Net that is being organized. K4FBW reports that it was a very poor traffic month with very little moving on any of the nets, both amateurs and MARS, NIZ and NGN report that on the night of Jan. 31st ten mobiles from Owensboro, Ky., and vicinity were dispatched by an amateur station set up at the March of Dimes Headquarters to pick up donations from those missed by the Mother's March. Newspaper and radio publicity, including a live rebroadcast of the hams in action, promoted good will for amateur radio. Forty-eight dispatches were made to the cars and nine messages sent from a second fixed station set up in the county headquarters to main headquarters. This provided a fast reporting system for county donation totals. Operation was on 29.6 Mc. Incidentally, the mobiles picked up more than \$100.00. CDA, Section Emergency Coordinator, urgently requests reports from ECs on the number of Emergency Corps members. Traffic: K4WBG 876, W4ZLK 106, K4FBW 60, W4HIS 51, CDA 41, RPF 34, N1ZL 381, SBI 32, VBA 30, JCN 15, OGP 14, YOK 4.

**MICHIGAN** — SCM, Fabian T. McAllister, W8HKT — Asst. SCMs: Joe Beljan, 8SCW; Bob Cooper, 8AQA, SEC; GJIL. New appointment: PHA as ORS. Newly-elected officers of the Grand Rapids Club are OCK, pres.; OPZ, vice-pres.; QOJ, secy.; CKK, treas.; TIJ and CPV, directors. Since this is the end of the road for me as SCM I want to thank the entire membership for splendid cooperation during my term of office. Special thanks go to those appointees who have helped to keep the organization functioning; the Assistant SCMs, the EC organization, the Route Managers and net control stations, and to all those whose attendance on the nets has been an inspiration to me. Your work has been deeply appreciated, and I hope you will continue to give the same support to the new SCM that you have given me. You have made an excellent choice in RAE as SCM. Tom is one of the old-timers of radio, and you will meet him on both 'phone and c.w. Again, many thanks; and I'll be seeing you. Traffic: (Jan.) W8NUL 215, ILP 116, ZLK 110, RTN 91, SCW 84, DAP 68, SJF 65, SWG 58, JKN 56, QIX 55, WYL 49, FX 44, IUJ 42, WXO 30, DSE 26, HKT 23, NTC 21, FSZ 18, NOH 17, HSG 12, AQA 10, OQH 8, PHM 8, INF 5, YDR 5, AUD 3, EGI 3, MEX 3, BRV 2. (Dec.) W8SCW 67, IUJ 44, TOP 13.

**OHIO** — SCM, John E. Siringer, W8AJW — Asst. SCMs: J. C. Erickson, 8DAE; W. B. Davis, 8NFB; and E. F. Bonnet, 8OVG. SEC: UPB. RMs: DAE and FYO. PAMs: EQN and HUX. New appointments include DVL as ORS, BHF as EC, and HOH as OES. We regret to report the deaths of ROX and WYE, both well known in the Cleveland Area. DSX, SRN Manager, reports that LHV and MQQ have been issued net certificates. Please note the announcement of the Ohio QSO Party. It is hoped that 1955 will produce more entries than the two previous years when 1953 netted 17 and 1954 showed 27. WE's XYL has worked 46 states. W8NUPH has worked 19 states in three weeks of operation. ZLP became the father of twins on Jan. 5th. NGW, QSL Manager, reports that approximately 500 W8s have cards on file but no envelopes. The Cleveland North-east gang has gotten a Viking Ranger for the clubhouse. A new organization, the Nameless Wonders, meets the first Fri. of each month at the Euclid YMCA on Babbitt Road. AQ has installed a ground plane for 10 and 15 meters. PS reports that he is helping Novices TTQ, TTX, and UCP to get on the air. DAE, BN Manager, is holding special net sessions on Sat. and Sun. at 11:00 a.m. The Fulton County Amateur Radio Club has been organized with SXU, pres.; ZIUQ, vice-pres.; VAQ, act. mgr.; and UPR, secy.-treas. Recently licensed Novices in the club are UAG, UAC, TTV, and VFO. GDQ has worked all states on 160-meter 'phone. FJP built an electronic keyer. GCP's favorite bird brought him his second son on Jan. 11th. BSRA (Akron) officers for 1955 are VQI, pres.; BFII, vice-pres.; CMC, secy.; and KCK, treas. Steubenville became the second city in Ohio to have its RACES plan approved. ERR is Radio Officer, ZRI is alternate, and DNQ is assistant. On Jan. 2nd the Travelers Motorcycle Club of Toledo held its annual "Snow Run" with 16 stations participating. VQP was declared the winner in Toledo's hidden transmitter hunt of Jan. 23rd. The Locking Valley Radio Club recently was organized with CRS, pres.; LQH, vice-pres.; and EFQ, treas. New officers of the Lake Geauga Radio Club are OXS, pres.; TPM, vice-pres.; W8NRCE, secy.-treas.; and OMZ, act. mgr. The club station, RWF, is being rebuilt and will have 75-, 10-, and 6-meter rigs. Dayton RF Carrier devotes much space to the coming Hamvention of Apr. 2nd. Other Dayton news: NFA made WAS on 40-meter c.w., FFM has moved to a new QTH, PLV had a QSO which lasted over an hour on 40-meter 'phone although running but four watts. RHG has a new 75A-3, FPZ is doing an excellent job in his training of c.d. operators and 7IIP has been transferred to Dayton. OVARA's *Ether Waves* shows that 13 members are over the 100 mark in countries worked with JIN, at 247, leading the pack. Springfield's Q-5 reports that JRG was the club winner in the SS Contest, with HBJ and RWZ taking second and third, respectively. The FIARA News Bulletin states that DMU is staying in Topeka, Kans.; DCE has finally gotten on mobile; and the Covered Dish Supper of January was a yelping success. The Toledo *Shack Gossip* informs us that OFG is going to town with a 6-watt rig; the

### THIRD ANNUAL OHIO INTRASTATE QSO PARTY APRIL 16-17

The Ohio Council of Amateur Radio Clubs will sponsor a QSO party, open to all Ohio amateurs, which will be held April 16-17, 1955, from 6:00 p.m. EST Saturday until 6:00 p.m. EST Sunday. All Ohio amateurs are urged to participate in this affair and to submit their logs to the contest manager.

Any and all amateur bands and any mode of emission may be used. There will be no power restrictions. Scoring: multiply the number of Ohio stations worked by the number of Ohio counties contacted. Each station may be worked but once regardless of band or mode of emission used. Logs should include call signs of stations worked, time, date, signal reports sent and received and the county in which the station is located. Operation near the following frequencies is recommended: 3550, 3740, 3860, 7100, and 7250. On the other bands, take your pick. The call "CQ Ohio" should be used on both 'phone and c.w. At least five appropriate certificates will be awarded to the highest scoring stations. Certificates will also be awarded to the Novices, the number of certificates being contingent upon the degree of activity.

All contest logs must be postmarked no later than May 1st, 1955, and should be sent to the contest manager, Hamlin King, W8EQN, 353 So. Arlington Ave., Springfield, Ohio.

WITs have a spanning new harmonic; new Novices are UPH, UPL, ULX, and TTH; YGR is building a new home; UEL has been transferred to California; and QCT has dropped the "N." The Columbus *Carascope* mentions that MRC is building a 20-meter Quad; OMY is going great guns on 15 meters; NPF is doing better than 30 w.p.m. on the mill; and LVF has returned from his tour of duty. North-eastern Ohio's *Ham Flashes* relates that BRG is now on 40-meter 'phone; SXG has a new Ranger; JIF is temporarily QRT while rebuilding; JWC has returned to the air; NUW has been released from the Navy; and the RACES plan for the Youngstown Area has been approved. Traffic: (Jan.) ### HUDSON DIVISION

**EASTERN NEW YORK** — SCM, Stephen J. Nenson, W2ILI — SEC: RTE. RM: TYC. PAMs: GDD and JIG. The SARA, one of our oldest clubs, celebrates its 25th anniversary. Its record of achievements has been outstanding and lists many "firsts" in the field of amateur radio. As an example, the first microwave communication on 2300 Mc. was established by RMA and RYT in the year 1945. During the same year, UKL and RDL set the DX record of 800 feet on 21,000 Mc. The newly-elected officers are YIV, pres.; ZBY, vice-pres.; GRI, secy.; K2HON, treas. The Club directors, NZE, UKL, K2AXY, and K2CKS, promise an outstanding program for the coming year. To all concerned, our hearty congratulations. LXP, past-president of AARA, was honored by the U. S. Air Force with a trip to Thule AFB in Greenland for distinguished service. Through a 'phone patch, Garry has permitted the boys of this isolated area to talk with their folks back home. To thank him, the trip was arranged by the Pentagon. Congrats, Garry, for a job well done. **NOTICE:** The MHT Net meets every Sat. at 1300 on 3716 kc. This will correct the error in our February report. The HHRL is sending a copy of its excellent bulletin to each club in Westchester in an effort to create closer relationship and interclub visitation. We hope for the speedy recovery of K2CA and K2AVY. New on 144 Mc. are K2EQQ and KN2GZM. K2KJV has a new model 12 Printer. The HHRL authority on RTTY is AWQ. K2AWII lost one of his new homes plus a 5-kw. generator earmarked for the HHRL Field Day activity. The recent banquet held by the RVWARS was well attended and the FB talk given by Vern Chambers, of ARRL, was enjoyed by all. Traffic: (Jan.) K2BJS 512, W2CFU 30, K2HVN 19, W2ANB 14, K2EHI 12, W2APH 4. (Dec.) K2BSD 313, BJS 147, BE 76. (Nov.) K2BJS 187.

**NEW YORK CITY AND LONG ISLAND** — SCM, Carleton L. Coleman, W2YBT — Asst. SCM: Harry J. Dannels, 2TUK. SEC: ZAI, PAM: JZX. RMs: VNJ and LPJ. ZAI reports AREC membership has increased in

# What's New with the Electron?

*Latest power tube developments  
displayed by Eimac at annual  
I. R. E. show*

New and improved klystron, ceramic and negative grid tubes highlighted the Eimac display at the annual Institute of Radio Engineers show and convention in New York City, March 21-24.

High power Eimac amplifier klystrons range in frequency from 225-3000mc and 5500-7500mc and vary in CW power output from 50 watts to 50kw. Application-proved Eimac amplifier klystrons such as type 3K50,000L,

*High power Eimac amplifier klystron*

delivering 10kw/CW power output at 400-1050mc, make possible high power previously limited to VHF and lower frequencies. These amplifier klystrons are of ceramic and copper construction and, although larger than negative grid tubes, are easily the lightest and least complicated of any klystrons intended for similar service. Small, rugged Eimac reflex klystrons are designed for local oscillator use as high as 9600mc in airborne environments.

Sharing the spotlight with klystrons were the latest in Eimac ceramic tube developments. Ceramic replaces glass in these tubes, giving a greater immunity to thermal and physical shock, plus allowing revolutionary construction techniques. In production, the ceramic and electrode parts are placed one on top of the other, similar to stacking

*Ceramic tetrode and cross-section*

poker chips. The copper metallized seals are the electrode terminals.

Eimac also announced improvements in popular commercial and military tube types such as the 3X2500A3 and 3X3000F1 power triodes, as well as new high vacuum rectifiers and water- and air-cooled tetrodes.

Along with the new, Eimac featured products that have been performance proved through years of operation in all types of commercial and military service. These tubes, of course, included the Big Six of Amateur Radio operation, the 4-65A, 4-125A, 4-250A, 4-400A and 4X150A radial-beam power tetrodes and 4E27A radial-beam power pentode.

New developments and standard line tubes shown at the I. R. E. show represent the leadership and reliability that have made Eimac the world's largest manufacturer of transmitting tubes.

*The Big Six of Amateur Radio: 4-65A, 4-125A, 4-250A, 4-400A, 4X150A, 4E27A*

*"What's New with the Electron," a brochure distributed at the I. R. E. show discussing Eimac tube developments of the past year is available upon request. Write our Amateurs' Service Bureau for your free copy.*

MANUFACTURERS OF PRECISION ELECTRONIC EQUIPMENT

Brooklyn, Nassau, and Queens. VNJ is planning to reactivate the Section Training Net (NLT, 3710 kc.). All KNs and slow-speed General Class licensees interested in this traffic net are urged to contact Vic. LPJ continues to collect BPL cards and the XYL/OAI combination of KEB/KFV continues to break section traffic records. JOA received EAN Net certificate. MUM made DXCC. K2ABW added a new antenna to his 813. K2HID won a Viking Adventurer kit at the Fordham RC. OKU is going RTTY. K2ECN is completing a 300-watter. K2IYK dropped the "N." LGK uses a Williamson amplifier for a modulator. The Tu-Roro Club already is planning its Field Day in W3-Land. JGV is going mobile. OBU keeps his old rig going while hoping for a modern transmitter. EC and GP are kept busy with business, which explains their low traffic scores. KN2KMD is a new Novice at IJJ. K2DVT expects to invade 2 meters. K2AED is converting a 522. ENW and K2ESZ completed 813 rigs per Jan. '54 QST. ENW also has 10-meter mobile ready for spring mobiling. K2CMV built GDO and audio oscillator for test gear. JCA is rebuilding 813s and expects to move out on the Island in May. DSC is the proud possessor of a WAC certificate. KFV has completed Viking mobile and VFO. DLO has finished 220-Mc. transmitter and crystal-controlled converter for the same band. 5ZRA, GG's son and TUK's brother, is off to North Africa with the Air Force. RB has a new SX-88. CXI became the proud father of a baby boy. The Nassau 10-meter AREC Net had a successful hidden transmitter hunt with 12 mobiles and 4 fixed stations locating GPQ/KCW. K2HYK received 20-w.p.m. CP certificate. AEV visited ZS6-Land and EL2X. Ray is adding a 75A-3 to his shack. The Levittown RC started '55 with 20 new members and a brand-new 2.5-kw. generator. The VHF SS saw many new stations active. K2ED returns to the air with a Viking II and an HRO-50T. K2AMP is working on a new VFO. K2DDU now is a MARS member. UXY is returning to 144 Mc. IRTV/2 has modified the HT-6 on 75 meters. The Columbia U. station, AEE, is heard regularly in contests. CLG has a new Gonset 20-meter beam. TUK is completing the Signal Slicer for s.s.b. reception. FI reports that RACES activity in Nassau County is increasing. RDK has moved to W8-Land. K2DND, ex-8MUP, and 5MLR, now are heard on 144 Mc. GG has added crystal converter for 2 meters. Please continue mailing reports to TUK to avoid re-mailing by YBT. The percentage of reports for the last quarter of 1954 shows that many stations do not report as regularly as they might. Keep the reports coming! Traffic: (Jan.) W2KEB 1016, KFV 720, LPJ 584, VNJ 344, JOA 290, MUM 162, BO 129, AEE 125, K2ABW 69, W2JZX 67, K2HID 64, CRH 41, AMP 27, W2LGK 22, K2HYK 18, W2IN 16, JGV 14, GP 13, OBU 10, EC 5, IAG 5, TUK 3, K2AED 2, W2HJ 2. (Dec.) K2GXL 10, DDU 2.

**NORTHERN NEW JERSEY** — SCM, Lloyd H. Manamon, W2VQR — Asst. SCM: Charles Teeters, K2DHE. SEC: IIN, PAM: CCS. RMs: EAS, CGG, and NKD. A new club, The Raritan Bay Radio Amateurs, has been organized in the Raritan Bay Area. Officers are TTM, pres.; K2DDM, vice-pres.; K2BEV, secy.; SUT, treas.; and K2EQD, act. mgr. K2CHI has a new Viking II. K2AFQ is having receiver trouble. YVQ has a ground-plane antenna on 20 meters. EAS reports the Jersey Net is alternating NCS each night of the week. NIY has worked more than 1000 different Novice stations. EWZ now has 30 watts on 3.5 Mc. The Windblowers VHF Society is making plans for a visit to 1HDQ's shack and ARRL Headquarters. Many of the members expect to be on 420 Mc. and higher very shortly. JCO is QRL with school work. K2GAS is a new ORS. Dick ran up a fine score in the CD Party a few days after receiving his ORS certificate. The Ocean County Amateur Radio Assn., AFU, elected the following officers at a dinner meeting: Arthur C. Wilkes, pres.; Joseph Solante, secy.; and William Thorne, treas. After the election two films sponsored by Hallcrafters were presented on the screen, "Adventure in Africa" and "The SCR-299B." At a later meeting K2AT demonstrated (at his home at Princeton Junction) microwave transmissions, transistors, transmission of modulated light waves, and a solar battery in action. K2BAY has finished the new VFO and is back on the air only to find he has TVI. K2DSW needs four more states for his WAS on 40 meters. HNP is lending a hand with the RACES program in his home QTH. CVW was active in the CD Party. KN2HXP sends in his first report and says he has the Novice 807 rig as described in the *Handbook* all fired up on 40 meters and is having wonderful luck with it. Herm rolled up 1292 points in the Novice Roundup. You need not be an ARRL member to report your activities. We are pleased to hear from anyone. Anyone knowing the QTH of KN2JLQ, please pass it to the SCM. I am holding a KN6 QSL card for him. JKH is off the air until the new home is completed. KXD has a new addition to his family, a little boy. ZPD is doing a fine job with RACES in the Bloomfield Area. His monthly news letter, *The Signal*, distributed to all members of the Bloomfield Civil Defense and RACES members, is a very excellent way of keeping up interest in this activity. LQP reports Bergenfield well organized in the RACES program. The Irvington Radio Amateur Club held its annual banquet Feb. 21st at Townley's Restaurant in Union, N. J. K2ICE and asst. operator

VPS-T90  
Mobile Power Supply

Speaker for  
Fixed Station Operation

Speaker for  
Mobile Operation

Here at Harvey-Wells, we make communications systems for military and commercial applications, and we believe that Hams too, want their stations complete in every respect. That's the basic thinking behind this new equipment we are introducing.

The tremendous success of our TBS-50 Bandmaster has been due in part to the fact that it can be put on the air quickly and efficiently because it is a complete "package" with no additional equipment necessary.

Our new T-90 Bandmaster Transmitter is also a complete "package". It can be on the air five minutes after you bring it home if you so desire.

Just plug in the power supply and connect the antenna. Our new R-9 Bandmaster Receiver, in its matching case, becomes an integral part by simply connecting the antenna to the T-90.

For fixed station operation, we offer the APS-90 A.C. Power Supply in a cabinet to match. (Just connect to 115V A.C., plug the output cable in the rear of the T-90 and you are ready to go.)

The R-9 Bandmaster Receiver has a built-in A.C. supply. For mobile operation we have two vibrator power supplies, the VPS-T90 for the transmitter, and the VPS-R9 for the receiver. Both are convertible for 6 or 12 V operation.

Speakers for either fixed or mobile operation are matched electrically and physically to the R-9 Bandmaster Receiver to complete the system. This new Bandmaster Series is a complete system, engineered for fixed, mobile or portable operation — a system which has beauty as well as efficiency. It's well worth waiting for.

P.S. We are still making the world-famous TBS-50 too!

**Harvey-WELLS ELECTRONICS, INC., SOUTHBRIDGE, MASS.**

A compact wide range VTVM-Ohmmeter for modern electronic circuit checking in the laboratory, on the production line and in the ham shack. Features include Peak-to-Peak voltage ranges which afford a new high in P-P reading accuracy of pulsed wave-forms in color or monochrome TV and similar applications.

# MALLORY HAM BULLETIN

## Pi Coupling Networks are easy to make with Mallory 153L Decade Switch

Whenever an amateur designer tackles the job of putting together a "Pi" antenna coupling network, he runs into the problem of getting a wide capacitance tuning range on the antenna side of the circuit.

The usual method of assembling a decade group of 10 mica fixed capacitors and a selector switch is not nearly as simple as it sounds. First, it requires 10 capacitors... which take a lot of space. And second, getting these units arranged into a compact, short-lead pattern is far from easy.

Here is what radio experimenters at Mallory did to lick the problem. Instead of 10-unit decades, they built a capacitor decade with only four capacitors... by using a Mallory Type 153L Switch. Type MC 500 volt mica capacitors, with values of 100, 200, 300 and 400 mmfd. are connected to the switch in the recommended manner. As the switch is rotated, the capacitors are automatically connected in single and parallel arrangements to provide ten steps of 100 mmfd. each, plus an "off" position. If you're not familiar with the 153L Switch, you can find a description in any late Mallory Distributor Catalog.

Placing a variable capacitor, with a range of

about 20 to 235 mmfd. in parallel with the decade switch provides an output circuit with a smoothly adjustable range from 20 to 1335 mmfd. This circuit, as set up by Mallory amateurs, gives good matching from most low power final amplifier stages into a wide range of antenna feeds. It will be smoothest when working from plate impedances of the order of 3000 to 5000 ohms into a 50 ohm co-ax fed antenna system. As drawn here, the circuit will work well on all bands from 3.5 through 28 megacycles.

The inductor  $L_1$  must be made adjustable over a range from 20 to 2 or 3 microhenries, depending on the frequency band and on the particular plate and antenna impedances. Representative values will be found in the Radio Amateur's Handbook and in magazine articles on "Pi" network operation.

Your Mallory distributor will be glad to show you one of these versatile Capacitor Decade Switches, as well as the many other Mallory electronic components that you can rely upon to keep your rig in top-notch operation. Stop in and see him soon, and put this idea to work for yourself, too!

**\$2.50**  
 (suggested net price)

**New Tool Kit simplifies cutting of control and switch shafts**

## Centralab Shaft-Kut Kit

These tools are especially handy when you have to cut off a shaft, adapt a shaft and knob type, or pry out the slot in a Centralab "R"-type Front Fastatch Dual Control. Here's what you get:

1. Custom-made, hardened carbon-steel, shaft clamp that holds any shaft in a vise, firmly and without damage.

2. Fine-tooth, high-speed black saw blade that has extra-fine teeth (32 per inch) for a clean cut.

3. Precision, half-round, needle file that is narrow enough to get inside the tubular outer shaft of a dual concentric.

4. "A"-size drill that is just the right size to drill out those few special plastic knobs so that they fit the inner shaft of a CRL Fastatch dual.

5. AK-16 drill stop that limits the depth of cut to the exact dimension required.

6. Small screwdriver that you can use to adjust set-screw knobs, and to do many other jobs.

Ask your Centralab distributor to show you a Centralab Shaft-Kut Kit. See if you don't agree that it can be mighty useful to you in a hundred-and-one different ways. Then buy one.

# before you buy... **Check for TVI!**

It's not always easy to spot points of superiority among competing products, but after careful comparison one out of every four active radio amateurs has chosen the world famous Viking II transmitter.

That's why we say, "Before you buy . . . check for TVI!" Effectively TVI suppressed, the Viking II leads the field in performance, signal quality, and dependability.

Amateur Net **\$279.50**

Viking II Transmitter Kit. Complete with tubes, less crystals, key and mike Cat. No. 240-102

*Before you buy your amateur transmitter, make sure:*

- ✓ **Cabinet shielding is complete**, metal to metal bonded every inch of the way. Experience has proven that even the smallest aperture may allow TVI harmonics.
- ✓ **Control shafts are bonded to the panel** — otherwise they act as small antennas for harmonics.
- ✓ **Meter is thoroughly shielded and leads filtered**—a dangerous area for harmonic radiation if not protected.
- ✓ **All external leads are carefully filtered** —The AC line, key leads, control leads, power leads for other equipment—all can radiate harmonics unless they're filtered before they emerge.
- ✓ **Dial apertures are shielded** — Every opening is a potential source of TVI.

All amateur bands from 10 to 160 meters, 135 watts AM phone input, 180 watts CW. All stages metered—instant bandswitching—wide-range pi-output tuning. Available from your distributor either in kit form or completely wired and tested.

**E. F. JOHNSON COMPANY**

2815 SECOND AVENUE SOUTHWEST • WASECA, MINNESOTA

Reports tell the story of GOTHAM BEAM performance—the gang says you can work more DX in a day off a GOTHAM BEAM than in a year off a wire or dipole. GOTHAM BEAMS are strong, too; easy to assemble and install, no special tools or electronic equipment necessary; full instructions included, matching is automatic; maximum power gain built into the design—AND ALL AT LOW, LOW, PRICES.

**NEW! NEW! NEW!**

## 2-Meter Beam Kits

GOTHAM proudly presents a 6 element Yagi beam for 2 meters at only \$9.95. Contains a 12 foot boom, 1" alum. tubing; 3/8" alum. tubing for elements; Amphenol fittings; all hardware, and instructions. Vertical or horizontal polarization, terrific performance!

And GOTHAM'S new 12 element Yagi for 2 meters at only \$16.95! Contains a 12 foot boom, 1" alum. alloy tubing; 3/8" tubing for elements; all Amphenol fittings; all hardware, and instructions. Vertical or horizontal polarization, multiplies your power by 32!

## 10 M. BEAMS

**S152T • Std. 15m 2-El. T match, \$22.95.** 1—12' Boom, 1" Alum. Tubing; 2—12' Center Elements, 3/8" Alum. Tubing; 2—5' End Inserts, 3/8" Alum. Tubing; 2—7' End Inserts, 3/8" Alum. Tubing; 1—T Match (6'). Polystyrene Tubing; 1—Beam Mount.

**D153T • DeLux 15m 3-El. T match, \$39.95.** 1—12' Boom, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 2—5' End Inserts, 3/8" Alum. Tubing; 2—6' End Inserts, 3/8" Alum. Tubing; 2—7' End Inserts, 3/8" Alum. Tubing; 1—T Match (6'). Polystyrene Tubing; 1—Beam Mount.

## 20 M. BEAMS

**S202N • Std. 20m 2-El. (No T), \$21.95.** 1—12' Boom, 1" Alum. Tubing; 2—12' Center Elements, 1" Alum. Tubing; 4—12' End Inserts, 3/8" Alum. Tubing; 1—Beam Mount.

**S202T • Std. 20m 2-El. T match, \$24.95.** 1—12' Boom, 1" Alum. Tubing; 2—12' Center Elements, 1" Alum. Tubing; 4—12' End Inserts, 3/8" Alum. Tubing; 1—T Match (8'). Polystyrene Tubing; 1—Beam Mount.

**D202N • DeLux 20m 2-El. (No T), \$31.95.** 2—12' Booms, 1" Alum. Tubing; 2—12' Center Elements, 1" Alum. Tubing; 4—12' End Inserts, 3/8" Alum. Tubing; 1—Beam Crosspiece, 1" Alum. Tubing; 1—Beam Mount.

**D202T • DeLux 20m 2-El. T match, \$34.95.** 2—12' Booms, 1" Alum. Tubing; 2—12' Center Elements, 1" Alum. Tubing; 4—12' End Inserts, 3/8" Alum. Tubing; 1—T Match (8'). Polystyrene Tubing; 1—Beam Crosspiece, 1" Alum. Tubing; 1—Beam Mount.

**S203N • Std. 20m 3-El. (No T), \$34.95.** 1—12' Boom, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 6—12' End Inserts, 3/8" Alum. Tubing; 1—Beam Mount.

**S203T • Std. 20m 3-El. T match, \$37.95.** 1—12' Boom, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 6—12' End Inserts, 3/8" Alum. Tubing; 1—T Match (8'). Polystyrene Tubing; 1—Beam Mount.

**D203N • DeLux 20m 3-El. (No T), \$46.95.** 2—12' Booms, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 6—12' End Inserts, 3/8" Alum. Tubing; 1—Beam Crosspiece, 1" Alum. Tubing; 1—Beam Mount.

**D203T • DeLux 20m 3-El. T match, \$49.95.** 2—12' Booms, 1" Alum. Tubing; 3—12' Center Elements, 1" Alum. Tubing; 6—12' End Inserts, 3/8" Alum. Tubing; 1—T Match (8'). Polystyrene Tubing; 1—Beam Crosspiece, 1" Alum. Tubing; 1—Beam Mount.

Southern Tech. in Atlanta, Ga., has a brand-new ticket with the call CIS. That makes Frosty's family 100 per cent ham as his XYL is UQT. Greetings to a new operator in Augusta, ZAK. Cony High School, of Augusta, has organized a radio club. Our own WTG is the "Veep." Incidentally, Charlie suggests that the Maine gang sponsor a Maine QSO Party and also a WAM certificate. For the third time the amateurs of Maine are asking the Maine Legislature to issue distinctive license plates to them in recognition of their service to the citizens of the Pine Tree State. Traffic: W1WTG 97, UDD 42, LKP 37, LYR 35, YVW 20, ZBN 12, TWR 11, BX 10, EFR 9, AFT 8, BTY 8, FD 8, YTE 8, ZME 6, BZF 3, WRZ 1.

**EASTERN MASSACHUSETTS—SCM.** Frank L. Baker, jr., W1ALP—New appointments: NCO Acton, QKY Canton, ZVX chairman of the Area 1 Radio Comm., as EPCs; ABJ as OPS; EPE as RM for 20-160-meter c.w. band and PAM for 160-meter 'phone. Appointments endorsed: ORA Wakefield, KTG Cambridge, MRQ Groveland, TRC Maynard, as EPCs; LMU, QHC, and TNK as OBSS; LAMU and AOG as OBSS; UIR, AVY, and WSN as OOS; MRQ, AQE, AOG, and TY as OBSS; TNK and MRQ as OPSS; AQE as RM for 40-meter c.w. BJA is moving to Schenectady. LZW is on 40-meter 'phone, UIR is mobile. Heard on 2 meters: ODQ, DLY, DPN, RME, NVB, ABJ, CHN, DQF, WEW, DRP, AAI, DCJ, AQR, and K2CBD. New Novices are DQF, BB's XYL, and DRP. UOC's XYL, W1NDOM is Sonny Hayes in Quincy. K17PDG, ex-IPDG, now is living in No. Reading. ALP had a meeting at OLP's for the new towns in Area 1 Sector B with NFQ and CLF. A 2-meter frequency of 147.3 Mc has been assigned. The IPN has moved to 3970 kc. WSN has 500 watts on 20 meters. Sorry to have to report the death of KJZ, WHC has gear for 1215 and 432 Mc. AJZ has a 32V-2. VTX has a new 10-meter converter. YPT and YXJ are coming back to Cape Cod. BCN is on 3615-3912 kc. MFI is conducting a radio and code class in Hyannis. TJW has a rotating 75-meter dipole antenna. CLF is active on 15 meters. HIL built side-band slicer for HRO-60. The Cape Cod and Island Net has formed an organization which meets Mon. through Sat. from 0745 to 0915 on 3912 kc. It was started by SGL. AQE worked HK0AI on 40 meters. CTW is active on 15-meter c.w. The T-9 Radio Club met at HMC's and has perfected a Black box antenna 6x6x3! CAM is in EXIN. DOF participated in the January CD 'Phone Party on 75 meters. The Arlington Radio Club elected KNW, pres.; WYC, vice-pres.; THO, secy-treas. Radio Amateur Open House has changed its meeting night to Wed. at Cambridge YMCA, reports TON. KJO gave the Club a talk on Transistors. BSY gave a talk at the Wellesley ARS on Antennas. The South Shore Club had a talk by SX on S.S.B. and OOP spoke on VFOs. The Braintree Radio Club had TQQ demonstrate a Gonset Communicator on 2 meters and Mr. Lucas, wire inspector, gave a talk. DDH, a new ham in Reading, has TBS50-D. VFO NC-125 receiver. ABJ is on 4 bands. CLF has an SCR BC-211 frequency meter. KEK, Lynnfield EC, says they have the call DKH. ISU, Holbrook EC, has FED and JXM helping him. YYL is handling public relations for the Seacoast Ham Club. The annual meeting was held at RZZ's. Officers are WCL, pres.; AFE, secy.; YVB, treas. ALP attended a meeting of the Norfolk County Radio Assn. at NOV's. NCO, Acton EC, has TRD, YPW, MFI, BPA, and QEY signed up in the AREC. DVS, Falmouth ARX secretary, writes that the Club took part in the ARRL DX Contest. TJW, our EC, has made QLT and DVS his assistants. QLT will be Mobile Marine on the *Albatross*, mainly on 21 Mc. SUE and KCL are Mobile Marine on the *R.V. Bear* in the Caribbean. DJK has high power on 2 meters. The Wellesley Club held an auction with PTY, ZZO, and GGM. AZY and SSS have new HQ-140X receivers. WNI's DIR and DIY are on 80-meter c.w. UIE is 100 per cent s.s.b. UID repairs meters. QJR is on 20-meter c.w. ZPE has a new speech clipper for the Viking II. AVY has an Eldico automatic keyer with monitor. The Braintree Radio Club has received the call DUO for its station in the library, with TYN at the police station. OMU is putting up a long wire. LMU is rebuilding for 2 meters. QKA will be on 2 meters. UH has a new 20-meter beam. Newton has some new Motorola FM 2-meter rigs. EK is going to crystal converter for 2 meters. LVN is making trips to VP9-Land. On the last Winthrop C.D. drill HJF, DEL, BDU, CMW, DJ, OIR, MQB, NMX, BOX, DQF, DPN, DLY, DGV, DRP, TTH, and BB were on. 48TM is at Fort Devens and has a Viking Ranger transmitter on the air. Sorry to have to report the death of Helen Wright, 1UPN. Traffic: (Jan.) WIEMG 393, UOQ 238, EPE 99, WSN 95, IBE 40, LM 22, NUP 19, TY 17, AVY 16, MKW 14, CLF 12, AOG 10, BY 8, HIL 7, WU 6, IA 5, CTR 4, TYN 4. (Dec.) W1NUP 19.

**WESTERN MASSACHUSETTS—NOTICE TO WESTERN MASSACHUSETTS ARRL MEMBERS:** In view of finding that a technical lapse in his FCC license status had inadvertently occurred (confusion with June '53 date of Extra Class endorsement on same) Art Zayarella, W1MNG, asked Hq. to find his SCM nomination invalid. This left Mr. Osborne R. McKeraghan, W1HRV, in the running as the only eligible nominee and he has therefore been certified as SCM for the current term. SCM, Osborne R. McKeraghan, (Continued on page 38)

## Notes on the "Robert Dollar" Oscillator

Considerable use is being made of the circuit shown in figure 1 for overtone use. Redrawn as in figure 2 this circuit appears as a basic Pierce Oscillator where  $R_2$  is plate load. Capacitor  $C_2$  may be considered a blocking capacitor, while  $C_1$  is the plate capacitor providing capacitive reactance as required in the Pierce Oscillator.

This, for the moment, neglects the tuned circuit L-C. Such a situation occurs when L-C is detuned from the overtone crystal frequency. When the oscillator is placed in operation under these conditions Crystal  $Y_1$  oscillates, as in any Pierce Oscillator, on its fundamental mode. Output will be obtained from the circuit and drive indicated to succeeding stages. However, the crystal will be operating on its fundamental.

Spot Frequencies  
for Amateurs  
and Experimenters

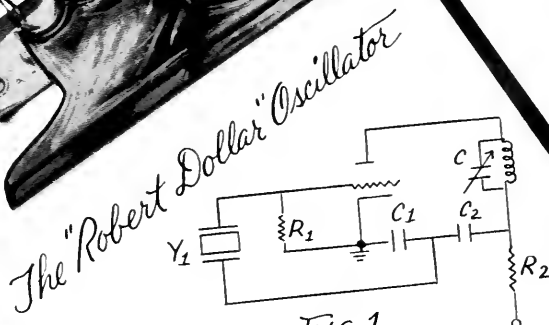

FIG. 1

FIG. 2

## ONE-DAY PROCESSING

### Spot Frequencies 2000 KC to 75 MC

**.01 % TOLERANCE**—Crystals are all of the plated, hermetically sealed type and calibrated to .01% or better of the specified frequency. See specifications below:

For close tolerance and commercial applications use the F-6 series crystal. Write for full information).

### SPECIFICATIONS

**Holders:** Metal, hermetically sealed, available in .093 dia. pins (FA-9) or .050 dia. pins (FA-5).

**Calibration Tolerance:**  $\pm .01\%$  of nominal at  $30^\circ \text{C}$ .

**Temperature Range:**  $-40^\circ \text{C}$  to  $+70^\circ \text{C}$ .

**Tolerance over temperature range** from frequency of  $30^\circ \text{C} \pm .01\%$ .

**Circuit:** Designed to operate into a load capacitance of 32 mmf on the fundamental between 2000 KC and 15 MC. Designed to operate at anti-resonance on overtone modes into a grid circuit without additional capacitance load. Write for recommended circuits).

Orders for less than five crystals will be processed and shipped in **one working day**.

**HOW TO ORDER**—In order to give the fastest possible services, crystals are sold direct. However, crystals are also available by special order through your local jobber. Where cash accompanies the order, International will prepay the Airmail postage; otherwise shipment will be made C.O.D.

### PRICES

## MODULATION SPLATTER CHOKES

The new Triad 100 mil Splatter Choke minimizes splatter caused by over-driven modulators and audio distortion. Ideal for mobile operation or other low power applications. Multiple taps provide various inductance values. Small, lightweight, insulated for high voltages, "Climateite" treated and ruggedly built for long, trouble-free use.

Typical Circuit for Mobile Operation

WIHRV. Send station and club news to 22 Mutter St., Easthampton, Mass., please. In building up our section organization and activities we ask your cooperation and reports, please, right after the first of each month. MNG summarizes all our January activities and announcements; this will be our task next time. The WM c.w. Net meets on 3560 kc. Mon. through Sat. at 1900 EST. WM Phone Net will require overhaul for survival. SSBand activity in No. Adams has engaged MKJ, MJD, and ZEO, who ran 10 milliwatts peak on 75 meters at 8 p.m. QWJ has been logging QSOs with I7, ON, IIB9, and Gs on 3810 kc. in early-evening using mechanical filter in home-brewed rig and Q-Multiplier in the receiver. EC endorses: LLN, IIRV, SPE, RLV, COI, ORS: HRV, LLN, UVI, TVJ's absence from the traffic column is caused by heavy school skeds and diligent OObserveing; 21 notices to stations mostly outside of WM, ULE and ULF have changed their QTH to Connecticut. An active YL is YCU, Judy of SatEvPost fame, who now makes her traffic debut as manager of the College Net. Along with top traffic honors, UKR has taken on the job of national radio chairman for the Powder Puff Derby terminating at Barnes Field, Westfield, July 2nd through 7th. Eunice is lining up help for this event which should give WM amateurs a firecracker field day on 75, 20, and 2 meters. The Hampden County Club is in the act. LJQ, TAY, and ex-QFB are instructing code for Northampton c.d. EVZ is communications officer for the newly-established C.D. Area 4, all of WM except Worcester County (Area 3). COI is itching to fire up his rhombics. Active in the January CD Party were ABC, AMI, BKG, JYH, MNG, MVE, and WEF. BVR has a new Viking II and improved signal. VSR was heard on 75 meters. FKN checks into VNH — managed the 2-meter Connecticut Valley Roundup (145.3 Mc. at 2000 EST, Thurs.). Some 40 WM stations took part in the January V.I.F. SS. Included were 31 Hampden County stations which rolled up almost 20,000 points. Traffic: WIUKR 254, MNG 74, BVR 68, SRM 62, IIRV 53, KIWA 48, WIAMI 26, TAY 25, WEF 24, DVW 13, YCU 13, ABD 9, HRC 8, HNE 6, JYH 4, BH 3, UVI 3, NY 2, AVK 1, LLN 1, MJD 1, YCG 1.

**NEW HAMPSHIRE** — SCM, Harold J. Preble, WIHS — SEC: BXU, RM: CRW, PAM: AXL, AIJ has taken over NCS for the Merrimack County Emergency Net and is using a new Viking II complete with Matchbox, VFO, and SX-99. This net meets Tue. at 1830 on 28.6 Mc. IP has been appointed ORS and is getting a kick out of handling traffic again. YHI has a new jr. operator named Garry, born Jan. 2, 1955. YFZ has enlisted in the Air Force. TWP has completed his kw. and is doing an FB job with it. CNR, a new addition to Portsmouth RC, has been appointed Asst. Radio Officer for Portsmouth C.D. YMJ is busy building lobster traps. JWJ, YFZ's dad, still is doing a terrific job of teaching code classes. The Portsmouth C.D. Net meets on 29.560 Mc. Thurs. at 1900. ARR has a new electronic key. SSK is busy at present with hi fi. Rockingham County EN, phone section, meets Sun. at 1230 on 3850 kc. Rockingham County stations, please call in. WBM recently took a trip to New Jersey and reports lots of activity on 2 meters in New York City and New Jersey, using his Gonset Communicator II. Let's continue to the following Novices: CRC, CSE, CSW, CUE, CUI, CUL, CWN, and DCB. Traffic: WICOC 51, IP 43, ARR 40, HS 34, CCE 30, POK 9, WBM 9, CDX 6, FZ 5, VZS 2, YHI 2.

**RHODE ISLAND** — SCM, Walter B. Hanson, jr., WIKKR — SEC: TQW, RM: BTW, PAM: VXC. The NCRRC installed the following new officers and celebrated at Stone Bridge Inn: ODZ, pres.; TXF, vice-pres.; AJR, treas.; ZUL, rec. secy.; YAO, corr. secy. JFF and TRX report the Newport County Emergency Net now is on 29.536 kc. 4CVO/1 appeared on the Honor Roll of frequency measuring stations for 1954, and is grinding crystals for Novices on 40 meters. KCS notes ever-increasing section activity in V.I.F. Contests and aurora openings for these who are patient. CDV has left for Navy duty from March to November. A new club has been formed in Woonsocket with the call DDD. The Blackstone Valley Amateur Radio Club has started with a bang and has its state charter. The Club has a summer club house plus winter quarters at Stone House Club and was given a two-page spread in the local Sunday paper. The officers are IIIW, pres.; ZEZ, vice-pres.; DPA, secy.; DOR, corr. secy.; DQR, treas.; AUT, act. mgr. The BVARC meets every Fri. at 8:00 p.m. Your SCM happily reports a new high in station activity reports this month. Keep them coming. Traffic: WICDV 114, UTA 60, YKQ 32, BTW 31, ZXA 17, BXX 16, W4CVO-1 13, W1VXC 8.

## PRINTED CIRCUIT KIT

Make your own etched wiring at home, for receivers, transmitters and test equipment. No silk screen or photo plates. All materials and instructions send \$2.95.

**ELECTRONIC CIRCUIT SUPPLY CO.**

2078 VYSE AVE., BRONX 60, N. Y.

2 meter Communicator owners

a 10 time  
increase  
in output power

*quickly... simply... economically*

THE 2 METER LINEAR RF POWER AMPLIFIER...a new member of the Gonset Communicator family...provides carrier power output of 50-60 watts...when driven by a Communicator.

Patch to existing Communicator in less than a minute, no alterations required. Switching Communicator to transmit automatically activates the amplifier...including antenna change-over relay.

Gonset has "Engineered out" tricky adjustments. Fool-proof, easy tune up requires only observance of amplifier panel indicator in conjunction with conventional set-up of driving Communicator.

Amplifier uses push-pull 826 VHF triodes with forced air cooling. Power supply utilizes two, 5U4GB rectifiers in a husky, voltage doubling power supply circuit. Cabinet matches, (style and size) that of Communicators, looks (and operates) well with other 2 meter equipment.

#3063 ..... Net 149.50  
Complete with tubes,

6 meter Communicator owners

Designed essentially to complete the new Gonset 6 meter Communicator package, the excellent characteristics of this new beam render it well suited for general 6 meter use.

Consists of four elements, reflector, folded dipole and two directors; the array being largely pre-assembled thus simplifying field erection.

A balun is provided for balanced feed and correct match of 52 ohm unbalanced coax lines to symmetrical folded dipole with low VSWR.

Forward gain is approximately 10 db. (Half wave dipole reference.) Front-to-back ratio about 20 db.

## FOURTH VERMONT QSO PARTY

The Tri-County Amateur Radio Club of Brattleboro, Vermont, announces the 4th Vermont (QSO) Party and invites all radio amateurs to participate. Vermonters are urged to work as many out-of-state stations as possible, so that interested amateurs can earn credit toward WAS, WANE and W-VT awards. Here are the details:

(1) Time: 24-hour week-end period from 6 p.m. EST Saturday, April 9, to 6 p.m. Sunday, April 10, 1955.

(2) No time limit and no power restrictions.

(3) Scoring: *Vermont stations*: 1 point per contact and multiply total by the number of states, U. S. Possessions, Canadian provinces and foreign countries worked during the contest period. *Outside stations*: 5 points for each Vermont station worked and multiply total by the number of counties in Vermont worked during the contest period.

(4) Credit for contacts with the same station on another band will be given this year, in order to promote more activity on the higher bands.

(5) A certificate will be awarded to the highest-scoring station in each state, U. S. Possession, Canadian province and foreign country, and to the highest-scoring station in each Vermont county. In addition, a W-VT certificate will be sent to any station working 13 of Vermont's 14 counties, provided the station has not previously been issued this award. Party logs showing required data will be accepted in lieu of QSLs.

(6) Watch 3520, 3740, 3860, 7050, 7250, 14,100, 14,250, 21,000, 28,100 and 28,800 kc. for contest stations. Stations are urged to spread out to keep QRM down and to allow our low-powered stations to be heard.

(7) General Call: "CQ VT." Vermont c.w. stations should identify themselves by signing *de VT (call)* K. Phones say, "Vermont calling."

(8) Contact information required: Vermont stations send number of QSO, RST or RS and county. All others send number of QSO, RST or RS report, and state, possession, province or country.

(9) Logs and scores must be postmarked not later than May 10, 1955, and should be sent to Tri-County Amateur Radio Club, c/o Ray N. Flood, W1FPS, 2 Marlboro Ave., Brattleboro, Vt.

VERMONT — SCM, Robert L. Scott, W1RNA — SEC: SIO. PAM: RPR. RM: OAK. The Brattleboro TCARC announces a Vt. QSO Party to be held Apr. 9th and 10th. Rules, etc., follow this report. The Burlington ARC states it will operate KOO/1 c.w. and phone in Grand Isle County during the QSO. The BARC voted to co-sponsor with the Montreal ARC the 4th Annual International FD at Bay-side (near Burlington) June 12th and also is working on the idea of combining the Vermont Hamfest with the FD. GAE is building a kw. rig, RPR a kw. final, and GAZ a kw. final. SEL is wintering in Florida and AXN is in Texas. BARC's new officers are VEB, pres.; WPK, vice-pres.; VSA, treas.; and NLO, secy. We understand QQN has an antenna for 75 meters now! FPS *still* is using a flit gun. WPY, VSA, VEB, and TBG are working 220 and 420 Mc. Traffic: W1RNA 140, OAK 78, AYP 60, IT 46, QEW 38, BJP 30, BNV 28.

## NORTHWESTERN DIVISION

ALASKA — SCM, Dave A. Fulton, KL7AGU — It appears that it soon will be hamfest time again and the date for the Alaska Amateur Radio Convention has been set for July 22, 23, and 24. It will be somewhere in the Anchorage Area and just as soon as we get the details will pass them on. AWB reports several good openings on 21-Mc. c.w. to the East Coast, also AWB reports lack of W interest in working KL7s in the C.D. Contests. Ws and VEs just don't seem interested, or is it the weak signal? We would like to know the answer to that one ourselves, Joe. It might be why more KL7s aren't on. DG is holding radio classes in Kodiak and there should be some newcomers soon from that island city. AGU finally has the mobile installed in the new vehicle and should be heard more often on 75-meter mobile. It should be about time to get the mobile tuned up. How about it, fellow?

IDAHIO — SCM, Alan K. Ross, W7WU — Ririe: LQU reports WNs WEX, WEY, and WEZ, at Menan, are now Conditional Class. Pocatello: QIS writes from Treasure Island that he is returning to his home in Pocatello. He spent most of his Navy enlistment in KHH-Land. Lewiston: IDZ reports a pot-luck dinner was held by the club. UJA won a receiver kit and OOW a multimeter. RGZ is building a crystal converter for 75 meters. Kellogg: RQG is trying

(Continued on page 102)

## A good microphone can improve your results as much as a high gain antenna

Ever notice that two signals of the same "S meter" intensity sound differently? One is muddy, dull, a little hard to read—the sibilant letters like S and F almost alike. The other signal is sharp, clean and readable even in QRM and QRN—because there's usable intelligence. No mistake about the call or comments.

The greatest variation is in the microphone. A sharp peak adds no intelligibility but limits the modulation to that value. A peak of, say 6 db, which is usual in many ordinary microphones, will reduce voice power by HALF. Don't be fooled by a microphone that sounds "louder"—loudness by itself is not a criterion of performance; quite the contrary since it may indicate undesirable peaks.

An E-V microphone with smooth, peak-free response, replacing an inferior instrument, often will do more for a phone signal than a new antenna or increased power. As a further *plus*, of course, you get well-known E-V durability, style and performance. An E-V microphone, to raise stations, to carry through a QSO, is your best station investment.

Shown above are a few of the E-V microphones designed for effective communications. Amateur discount applies.

(upper left) Model 611 high output dynamic and Model 911 crystal. On-Off switch. List from \$25.50 to \$37.50

(upper right) Model 950 Cardax high-level crystal cardioid, with dual frequency response. On-Off switch. List, \$42.50

(lower left) Model 630 wide range, high output dynamic, with exclusive Acoustalloy diaphragm. On-Off switch. List, \$47.00

(center) Model 636 "Slimair" wide range dynamic. Pop-proof head. Acoustalloy diaphragm. On-Off switch optional. List, \$70.00

(lower right) Model 623 slim-type high output dynamic, with E-V Acoustalloy diaphragm. On-Off switch. List, \$49.50. Also Model 926 crystal, less switch and connector. List, \$24.50

(Other E-V microphones for mobile and aircraft communications, telecasting, broadcasting, recording, and public address.)

THE JAMES KNIGHTS COMPANY  
SANDWICH, ILLINOIS

for 2-meter activity with himself and HXN already on. Emmett: TYG reports on the newly-formed Emmett Valley Radio club. Boise. Officers of the Gem State Amateur Radio Club are GHT, pres.; PKA, vice-pres.; and IWU, secy.-treas. JMH is back with us but still is using 0RSG/7. ALY also is back with us from a spell at San Francisco. OZJ moved to Caldwell. MKS reports Idaho RACES is awaiting approval. Traffic: W7RSP 52, NVO 4.

**OREGON** — SCM, John M. Carroll, W7BUS — HUI has resigned as net director for the Cascade Net and is being transferred to a post in the Army in the Far East. QWE and QJC turned in a perfect score for check-ins on the Cascade Net. The Cascade Net picked up contributions called in to KOIN on a March of Dimes program. A transmitter was set up in the studio on 29.3 Mc, and contacted the mobiles from there. HAZ is new president of the Powder River Camera Club. UAR and UAV are at EOSC at La-Grande. OWI is new president of the Baker Amateur Radio Club. QEI is active in MARS. AHP resigned as EC for Grants Pass and NTF was nominated as his replacement. SBT is active on 2 meters. WKA is working for his Conditional Class ticket. Skip conditions have made attendance in OSN difficult. The OARS has almost finished building the club house. VZD has a new QTH in Oklahoma. VBK is new president of the Southern Oregon Radio Club. VBII is new president of the PARC. SZS is becoming active on MARS. AEF has a new business QTH in Portland. This month marks the end of my two-year term and it has been a pleasure to be SCM for Oregon. ESJ will take over from here and please give him the fine cooperation I have received. Traffic: (Jan.) W7APF 957, QKU 222, VIL 111, TBT 49, AJN 32, BLN 32, WAT 30, QEI 28, ESJ 19, HDN 19, PRA 6. (Dec.) W7WAT 518.

**WASHINGTON** — SCM, Victor S. Gish, W7FIX — Your new Section Emergency Coordinator is RCM, of Vancouver, Wash. The North Seattle Amateur Radio Club elected JPH, pres.; WAM, vice-pres.; WAO, secy.; UZK, sgt. at arms, QH and FTX, trustees. Other trustees are CO, OEX, LWB, and PGY. VAX is on 3970 kc. at 0700 PST Tue. through Sat. for traffic. KUS is QRL trying to get the Fort Lewis station on the air. OE is traveling with new Adventurer for portable. AIB is playing around with the page 24 Feb. QST antenna-coupling systems. EHH is on ALN, FARM, WARTS, and Montana. Phone nets. KG-BDF/7 is having antenna trouble—the guy next door dropped a tree across it! The Skagit Emergency Net meets on 50 Mc. 8 to 10 A.M. Sat. GAT says "Conds!!!!" TGO is working 80-meter DX between studies. LVB has no regular skeds but takes traffic for anywhere. ZU still is keeping the Sun. 20-meter sked with PRZ at Cornell U. HDT hopes to get back on WARTS soon and reports UJA is on with a new 180-watt 4E27 rig. YPD, ex-6PZC, is building a new 813 final. CZY has little time for anything but MARS nets. JEY reports the MTN C.W. Net closed down because of conditions. Richland News from UQY: YFO is on 40 meters with 813 and ground-plane antenna; GWD, NLI, and UQY tested out equipment for the DX Contest; UBJ was heard chasing 40-meter DX with 150 watts and a new Vibroplex; PKP and VXE are on both e.w. and 'phone and PKP also is mobile. BA reports that he will be in KH6-Land for a month; JNC is on with a vertical—working across the fence; PGY has his RTTY copying; CBE RTTY copies and sends; TMO is working a KH6 with a Ranger; WAM made Gen. Cl.; PHO still is working on the cool, cool kw; OZG has a kw. on the air with a vertical. HMQ reports from Puyallup that EIJJ is on 75 meters; GJU has a new QTH in Olympia; HMQ is on 2 meters; LEC sends code lessons on 10 meters; MCU now is RTTY; MTX is buying mobile gear; OEB checks into all the nets he can find; VLC is NCS of the Novice Net; WHV made 173 contacts in 41 sections in the Novice Roundup; SWA and his XYL, WMX, are sharing a Globe Scout. The Radio Club of Tacoma elected RNS, pres.; RGD, vice-pres.; UYL, secy.; UIN, treas.; RGD, pub. (also Tacoma EC). The Apple City Radio Club is building a communications van for e.d. work. PVF is looking for a 6-ft. relay rack—he checked in on the WSN 1988 Net the next day after inquiry about nets. Traffic: (Jan.) W7BA 1740, PGY 1085, VAX 658, FRU 570, KUS 90, APS 38, UYL 33, EHH 30, USO 29, WEY 27, UZB 23, FTX 20, K6BDF/7 14, W7OE 14, AIB 13, FWD 11, KT 10, PQT 10, RX II 9, GAT 6, TGO 6, LVB 5, ZU 5, AMC 4, YPD 4, EYF 2. (Dec.) W7FRU 1522, KT 94.

## PACIFIC DIVISION

**HAWAII** — SCM, Samuel H. Lewbel, KH6AED — Many thanks to the gang for the honor of election as your SCM. The varied services "of, by, and for" ARRL members and amateurs are to be built up through appointment. There is a need for OOs, OBSS, the formation of an AREC, and traffic and net activity reports. In reporting use P. O. Box 3564, Honolulu. I expect to visit our neighbor Islands shortly, when possible on club meeting nights. Civil defense net activity is to be reported. Send all news prior to the seventh of each month. V.h.f. activity in Hilo and Honolulu has raised interest in this field. The gang is preparing for long-haul tests between Oahu and Hawaii. Attend all club meetings possible. Monthly reports are welcome! Traffic:

# VISIT OUR NEW HAM SHACK IN GREENWICH!

Bill Cummings, W1RMG

Like the weather, most people *talk* about Service, but they seldom *do* much about it. The Dale idea is to put service into action — so we're following up our promise to give some real service to the Connecticut hams in and near Fairfield County.

Our new branch at 375 Greenwich Avenue is now open and in business, with a big stock of ham gear, everything you need right on hand for fast delivery. And if you want an item that's not in the Greenwich stock, chances are it's only a few miles away in our New Haven warehouse. You name it — Dale has it!

In line with our method of giving you expert help with your problems we've put a first-class ham in charge of the amateur department at Greenwich. Those who know *George Gordon, W1UYT*, won't need a second invitation to stop in and see him in his new setup.

George knows plenty of answers and he has the time and patience to work out the fine points with novices and veterans alike. You can see him at the Dale Greenwich branch any day from 8:30 to 5:30 and on Saturday until 1:30.

Remember, he's ready to make you a good offer on your trade-in, as well as talk terms on any new or reconditioned gear. Here's your chance to get real service close to home, so drop in or phone George next time you need anything, from a coil to a complete rig.

KA2FC 2012, KR6KS 1831, KA2GE 1381, KA7SL 1317, KA2AK 1063, KA2WW 314, KA2HQ 187.

NEVADA — SCM, Ray T. Warner, W7JU — ECs: PEW, PRM, TVF, TJJ, and ZT. OPSS: JUO and UPS. ORSS: MVP, PEW, and VIU. OBS: BVZ. Nevada State frequencies: Phone — 3880 and 7268 kc. C.w. — 3660 and 7110. WVQ recently was elected presy of the Southern Nevada Amateur Radio Club. RKE left Boulder City for the Dakotas. WTR heads the TVI Committee in Las Vegas. WN7YNO is the son of VIU in Elko. VIU worked Japan on 80-meter c.w. WN7YNE is an XYL in Henderson. YJB is active in Henderson. WN7YEX is active in Winnemucca. SKU has returned to Nevada and is now on 40-meter c.w. from Sparks. Welcome back, Neil, QGE, of Sparks, is on with a Viking Ranger and SX-71 showing interest in MARS activities. PEW, Elko EC, expects to show an increase in daytime activities now that he is on a graveyard shift.

SANTA CLARA VALLEY — SCM, R. Paul Tibbs, W6WGO — EXN is QRL installing mobile in his new car and is rebuilding gear for low frequency. AIT is reporting in on NCN and RN6 for traffic. K6BBD is sporting a new Viking Ranger and reports that Santa Clara High School has organized a radio club. YHAM says the new HQ-140X sure brings in the signals. Don is looking for an insulator to take the base of the new vertical antenna. K6BBF has a new Gonset 144-Mc. rig using it to work fixed and mobile. K6BAM has been heard on s.s.b. of late with an FB signal. 4YIP/6, at Moffett Field, is a good outlet for overseas traffic. MMG reports officers of the North Peninsula Electronics Club are MMG, pres.; K6EMN, vice-pres.; LPS, secy.-treas.; QIE, act. mgr.; and NVD, QIE, and MMG, CCRC representatives. The Club meets the 3rd Fri. of each month. DPE is on the air with a new 803 final. WLI worked in the last CD Contest. FON reports in with traffic. KN6-EMO was active in the Novice Roundup and says that it was a thrill to work his first DX, JA1AEA. FTI is back on the air after a long period of inactivity, working on 14 Mc. mostly. CFK is coming back on the air with s.s.b. using Central Electronics exciter 20-A. IIC still is looking for you who are interested in traffic to check into NCN on 3635 kc. at 2015 nightly. There is need for New Mexico and Arizona stations to report into RN6 to handle traffic for those states. Let's fill these spots and plug up the holes in the coverage of these nets. Traffic: W4YIP/6 502, W6YHM 351, HC 95, K6BBD 71, W6FON 60, UTW 48, AIT 11, K6BAM 11, BBF 10, W6MAG 10, EXN 6.

EAST BAY — SCM, Guy Black, W6RLB — Asst. SCMs: Oliver A. Nelson, Jr., 6MXQ, for v.h.f.; and Harry T. Cameron, 6RVC, for TVI. RMs: IPW and JOH. PAM: LL. ECs: CAN, CX, FLT, QDE, TCU, ZZF, and K6ERR. New officers of the Richmond Radio Club are K6BYD, pres.; ACM, vice-pres.; IRJ, secy.; K6AYM, treas.; WXB, sgt. at arms; TWI, EFD, PAV, and EJA, board of directors; and K6CUH, TWI, ACM, and EJA, delegates to the CCRC meetings. In addition, TWI and EFD are on the TVI committee, PAV is the publicity chairman and K6DMI is program committee chairman. It's really swell of IJR to send in a complete rundown on the Club, and I wish other club secretaries would do as well. IRJ and FZC have been checking into the Central California Civil Defense Net (CCDN) Mon. at 7:30 p.m. 3501 kc. VPC reports for the Southern California RTTY Society that the following have just received Model 26 machines: KHW, FZC, CBF, RLB, NCQ, JNY, FSL, NEQ, MCU, and K6DCA. A recent visitor to the Bay Area was GNL6LS. NBS is building a new mobile rig. OHQ and WGM are new East Bay Radio Club delegates to CCRC. The EBRC heard a fine talk on traveling wave tubes by EXN and CQG. KHW and LBJ are now part of the Club's TVI committee, with 0HTG as chairman. K6ERR has a net for the Berkeley-Albany-El Cerrito AREC at 7:30 p.m. Thurs., 145.69 Mc. The SARO 144.27-Mc. Net is very active. The Oakland Radio Club has a fine project — an oldtime radio shack as a museum piece, to be located in the Oakland Red Cross building. Donations of old-time equipment are being solicited. GMB is building a new VFO. KN6GOY is building a 15-meter rig. K6IGN, at Richmond Union High School, is shared by ten operators. PAV has a 44-ft. vertical. KFU is a new assistant communications chief for civil defense in Richmond. K6DMI is taking care of mobile activities for civil defense. EJA is publishing a club paper for the Richmond Club, *The QRM'er*. ITH is spending a lot of time around Waikiki. K6CCQ is interested in 420 Mc. BXE is putting out Official Bulletins at 7 a.m. Mon., Wed., and Fri. for the early birds. Listen at 3870 kc. also at 7 p.m. on Mon., Wed., and Sat., same frequency. TI reports 175 foreign contacts and 36 countries with his new 7-Mc. ground plane in just three weeks. TMX expects to be active on Guam with a peanut power rig and HRO. Traffic: (Jan.) K6WAY 558, FDG 511, GK 146, W6IPW 115, EJA 13, YDI 3, HBF 1, (Dec.) K6WAY 353, W6ITH 17, K6CCQ 12.

SAN FRANCISCO — SCM, Walter A. Buckley, W6GGC — SEC: NL. The S.F. Radio Club enjoyed the movie "The Atom Goes to Sea" and also, through the courtesy of ELW, the slides "50 Years of Amateur Radio" by Bruce Kelley, 2ICE. Approximately 200 members attended the January Special. The 29ers transmitter hunt for the month

## WIREMAKER FOR INDUSTRY

Springtime is Baseball Time  
Baseball Time is TV Time  
TV Time is Trouble Time for  
the Ham whose neighbors have

**'TVI'... install  
BUD FILTERS  
and avoid 'TVI'**

### LF-601 Low Pass Filter

Interference to TV reception caused by transmissions from a Ham station can be caused by harmonics from the transmitter. They can be greatly reduced or eliminated with a Bud LF-601 low pass filter. Minimum attenuation of 85 decibels on all frequencies above 54 megacycles and a minimum of 93 decibels above 70 megacycles. Can be used with 52 or 72 ohm coax. Cut-off frequency is 42 megacycles. Maximum rejection adjustable from 55 to 90 megacycles.

**LF-601 Amateur Net \$13.95**

### HF-600 High Pass Filter

Has cut-off frequency at 42 megacycles, thus this filter rejects signals from 0 to 42 megacycles. It is within this range that the majority of signals causing interference are received. Since there is no attenuation above 42 megacycles, picture strength or quality is not affected. This unit is easily attached to the TV set.

**HF-600 Amateur Net \$3.00**

2118 East 55th Street

Dept. Q

Cleveland 3, Ohio

was put on by SY and BIP. The HAMS once again has changed its meeting night; starting in February the Club meets the 3rd Fri. night of each month. HAMS (Oakland Red Cross group) participated in the local disaster drill. Oakland supposedly was hit by a strong earthquake and all local branches of the Red Cross came to her aid. With Admiral Cooke in charge all the bay area cities attended a meeting at the local Jewish Community Center in San Francisco and gave a report on activity. The amateur group of Red Cross Communications put on a demonstration of how they worked in time of disaster. Five mobiles checked in with net control at center, stated what equipment they were using and their location. NL acted as outside net control and BYS acted in charge at the Community Center. Evidently the demonstration made quite an impression on the group. The point was brought up that amateurs could contact other amateurs in disaster places and obtain all the information needed before the Red Cross Survey Department could even reach the stricken city. The HAMS use the 2-meter band for c.d.-Red Cross work and the Club was congratulated on how well organized it is. YLRCSF, the ladies' radio group of San Francisco, celebrated its first birthday by holding a dinner for members and their families. CEE, Vada Letcher, president of the National Ladies' Radio Clubs, came up from Santa Monica to join in the celebration. The Mobiles had 14 members take a trip to Yosemite Valley. They had such a good time they decided to make Yosemite Motorcade a yearly affair hereafter. Three San Francisco amateurs died within a short time of each other, PA, YZL and JLS. Condolences to their families. KN6HIW has a new Harvey Wells transmitter. KN6JDK built a transmitter and now is ready to go on the air. KN6IKQ is the proud owner of a Viking II. PCN is busy trying to get news for the San Francisco Club paper. Congratulations to SWP and GQY on January BPL totals. QMO reports that she is active on c.w. YC is active on 40- and 80-meter c.w. CBE was busy preparing the rig for the DX Contest. ACN reports that approximately 2000 more ham plates have been issued since the 6040 list came out in June. License plate bills, Senate Bill No. 222 and Assembly Bill No. 593, already have been introduced at the current legislature session. Local amateurs are looking forward to the ARRL Pacific Division Convention coming up May 21-22 at Fresno. Many plan to attend. JZ, Pacific Division Director, fell and broke a couple of ribs. We wish Ray a speedy recovery. Congratulations to three new Novices, KN6JMM, KN6JMN, and KN6JKA. Traffic: (Jan.) W6SWP 663, GQY 533, QMO 203, YC 12, GGC 10, PHT 5. (Dec.) W6GQY 390.

**SACRAMENTO VALLEY** — SCM, Harold L. Lucero, W6JDN — The Golden Empire Amateur Radio Club is moving to the Engineering Bldg., Chico State College. The Shasta County Amateur Radio Club elected new officers Feb. 7th. The c.d. radio officers for Carmichael Calif., TYC, KKI, IQF, and UM are really doing a fine job. Congratulations. Our RMI has resigned. Who will fill Harvey's shoes? Any takers? Harvey, I want to thank you for your aid during your stay as RMI in the section. I only hope that you will return and give us further aid and I want you to know that your work was really appreciated by the entire section. Luck to you in your undertakings and 73 from us all. The Sacramento Council of Amateur Radio Clubs will make three awards: (1) For the year's Outstanding Amateur. (2) A merit award. (3) Certificate of Achievement. CIS reports he is QRL work but he makes c.d. drills. KN6JIG is new in Chico. PYE and SIA are still arguing over who has the best beam. FXO is playing with s.s.b. OEY, president of the Tehama County Amateur Radio Club, is expected on soon. LSB keeps a weekly sked with K6GVB, 100 miles on 144 Mc. with a 2500-ft. mountain between. New amateurs on the engineering staff of KBET-TV are QAQ, CVV, LEY; QEU is chief engineer. K6ER reported QRM from an Armed Forces station on 14,090 kc. K6ASX, in the northern part of the section, has ORS, OPS, EC, and OBS appointments. Jon's a junior in high school and skipped the Junior Prom to be in the DX Contest. The Dunsmuir Club is coming into its own and hopes to have a hamfest this summer. Well, fellows, in starting a new two-year term I hope with your cooperation it will be as pleasant as in the past. Traffic: W6MWR 20, CIS 8.

**SAN JOAQUIN VALLEY** — SCM, Edward L. Bewley, W6GIW — SEC: EBL, RMI: K6BGM. PAMs: ZRJ and WJF. The Sonora Club is getting started and already has a 250-watt Kaar transmitter at the Office of Civil Defense. PCB is secretary and the Club is building seven portable rigs for 2 and 10 meters, designed by CQI. EBL is kept busy every Sun. morning as NCS on the Central Valley Round Table at 1100 on 3900 kc. We have word that ZRJ and K6BGM moved to San Jose Mar. 1st. Doc and Ann have boosted lots of club and traffic activity in the section and we will miss them. K6EVM will replace Ann as RMI. WPV is getting on s.s.b. soon and is giving 2 meters a work-out. NTV anticipates about 500 watts on 2 meters with a pair of 4-125As. He already has the final. Sandy is proud of his new SX-96 receiver. The Stockton Club presented a television program on KTVU, demonstrating amateur radio. It was a wonderful job of public relations and thanks go to ZNL, QUE, and KN6HWT. EXH sends code nightly on 144.8 Mc. at 1830, 5 to 13 w.p.m. IAZ has bought a home at

Hughes-equipped  
Convair F-102  
all-weather  
interceptor.

*The time was never more  
opportune than now for becoming  
associated with the field of  
advanced electronics. Because of  
military emphasis this is  
the most rapidly growing and  
promising sphere of  
endeavor for the young electrical  
engineer or physicist.*

Since 1948 Hughes Research and Development Laboratories have been engaged in an expanding program for design, development and manufacture of highly complex radar fire control systems for fighter and interceptor aircraft. This requires Hughes technical advisors in the field to serve companies and military agencies employing the equipment.

As one of these field engineers *you will become familiar with the entire systems* involved, including the most advanced electronic computers. With this advantage you will be ideally situated to broaden your experience and learning more quickly for future application to advanced electronics activity in either the military or the commercial field.

Positions are available in the continental United States for married and single men under 35 years of age. Overseas assignments are open to single men only.

Publisher, Inc.

310 Canal Street, New York 13, N. Y.

Seacliff, JDC and LMA are active from their new QTH in Oakdale. VKR is working in Hawthorne. SJJ is building a 500-watt final. SNF is getting started in c.w. traffic with 60 watts to an 807. K6EVM is building a VFO for 40 meters. GRO is kept busy as proxy of the Am. Legion Net. JJE is putting out an FB signal from Lemoore on 2 meters. LOS moved from Stockton to Bakersfield. HXJ and KN6EEV moved to Stockton from San Francisco. Traffic: W6ZJR 459, FEA 171, ADB 119, GRO 116, K6BGM 55, EVM 28, W6SJJ 25, EBL 9, SNF 6.

**ROANOKE DIVISION**

**NORTH CAROLINA**—SCM, Charles H. Brydges, W4WXX—SEC: ZG, PAM: ONM, RM: VHH, PIC, in Greensboro, is a new ORS. CBP is working on a new pair of 812s and will be on soon. YPY has been doing fine business with his 813s but has a little TV trouble. TLA and WXX were in the 'phone section of the CD Party and BDU and VHH were in the c.w. section. MDA worked 24 stations in the V.H.F. Contest on 2 meters and made a real fine score, high score in the State. REW got his 37th state toward mobile WAS by working 1BCR in Rhode Island. Bill still needs Delaware before working on the western states. The Charlotte C.D. Net sounds very good on Sunday afternoons. There are about 35 stations on roll with about 20 checking in every week. DBQ is moving to Florida. AJW is expanding to 20 and 40 meters. During January CVX worked 18 new countries on 20 meters. His DX total now is 41—not bad for just getting on the band. There are several new stations on 2 meters in the Charlotte Area. VHH got Moresville with his 15 watts. DLX also is on 2 meters and TYR is building up stuff to get on. WXX received WAS and will be on with p.p. 813s soon. Not as many monthly reports were received as per usual this month. Let's have those reports next month and fill our column. Traffic: W4WXX 244, BUA 2, CVX 2, EJP 2.

**SOUTH CAROLINA**—SCM, T. Hunter Wood, W4ANK—BAN has moved to a new QTH and needs only Nevada for WAS. Congratulations to HDR on making BPL on 'phone. According to SCM records he is the first to have this honor in South Carolina. RPV reports a club is being organized in the Sumter/Shaw Area. LXX now is ORS and made a score of 95 in the CD Contest, saying that his antenna would not bring in the signals and he hopes to do better next time. FGX is making alterations in his rig and soon will be back on the air. ZRH was on 3700 kc. for 16 hours and 15 minutes during January sending Official Bulletins and code practice nightly at 7 p.m. The Charleston Club, HHO, has ordered a complete Viking emergency station with receiver and emergency power supplies. AUL reports that with the advent of TSU on mobile he has 5 mobiles on 75 meters in his EC net with two more prospects. The South Carolina C.W. Net, under RM AKC, meets nightly Mon. through Fri. on 3525 kc. at 7 p.m. The South Carolina 'Phone Net, under PAM FFH, meets at 7:30 p.m. Mon. through Fri. and at 0830 and 1530 Sun. The president of each South Carolina club is being appointed Asst. SCM to form a group to act on joint matters. The SCM should be contacted for this appointment. Traffic: W4HDR 378, AKC 213, FFH 108, ZIZ 108, RPV 26, ANK 23, YNR 3.

**VIRGINIA**—SCM, John Carl Morgan, W4KX—Hughes Motley, RTV, the new SEC, will be looking for volunteers for EC appointments in many areas. If you're interested, drop him a card. UBC succeeds sea-duty-bound LW as publisher of the *Virginia Bulletin*. LW, in Europe in January, sent a card from Germany. New arrivals include YL K4BUN, ex-K17AZL. Departures are LPP, now in Texas; BMX, gone to KP4-Land; and 3WDP, of K4MC, headed overseas. KFC reports visitors included 0NWXX, ex-NNN, KVM/VO6, and F0SAJ. Vic worked YV and ZL on 160 meters. The Central Valley ARC is conducting classes for some 25 prospective hams in the Staunton-Waynesboro Area. NRO reports the W.&M. ARC is in the doldrums. NQV won the senior championship in the international model plane meet in Miami in January. IF and YVG are bemoaning skip snafuings VN and VFN, but IF reports DXers QNing VN included ex-VNer 6CIW/KP4. Reported on s.s.b. in Virginia: FJ, IMP, IYC, JLV, JUR, MK, KMU, SPE, and VWS. JHI says since he and JFV are the only v.h.f.ers in the Roanoke Area, it's a lesson in patience waiting for "openings." CGE finally got an antenna that gets him beyond Norfolk City limits. Who says power is mandatory on 160 meters? BYZ got an OO QSL from Massachusetts as the result of VFO leak-through on 160 while he was on 80 meters. Pappy and jr., YE/YZC got a new 183D to go with the new all-band half-bucketful. EBII has ordered a new V-37 all-band vertical. KAO is back in business with a new Ranger. UBC's XYL is beavering away for her ticket. Thirteen-year-old EZB passed the General Class exam. PXA is VN Net manager. All appointees are requested to note appointment expiration dates and send certificates to the SCM for endorsement during the month previous to the expiration date. RJW was silenced during the transfer of his hard-working mobile gear to a new chariot. Traffic: W4PFC 1241, K4MC 136, W4TFZ 122, BLR 45, KFC 44, CFV 37, YKB 36, YZC 34, KX 28, IF 26, YVG 25, TYC

### Bliley CCO-2L

Now available for your amateur rig, a completely packaged oscillator unit designed and engineered to utilize the many advantages of crystal control on two and six meters. Output is obtained directly on six meters; operation on two meters requires only a tripler stage.

CCO-2L Output: 48 to 54 mc; Dimensions:  $2\frac{1}{4}'' \times 2\frac{1}{4}'' \times 4''$ ; Price: \$11.95 less tube and crystal (8-9 mc).

**BLILEY ELECTRIC COMPANY**  
UNION STATION BUILDING  
ERIE, PENNSYLVANIA

13, JAU 12, CGE 11, WYC 9, AVO 8, IA 8, OWV 8, YE 7, BYZ 4, WBC 4.

**WEST VIRGINIA** — SCM, Albert H. Hix, W8PQQ — SEC: YPR, RMs: GBF, HZA, DFC, and JWX. PAMs: FGL and GCZ. Congratulations to NCS on being awarded the special citation by General Electric in its Edison Radio Amateur Award program for his work during the Richwood Flood. HZA has officially accepted the position of acting as net manager for the c.w. net. KCN has a new Viking Ranger. EMG has the mobile rig working very well now. RRD has a new Viking II and new antenna. GCZ is a new PAM. SHG is well on the way toward completing WAS on 40 meters. IEQ is NCS of the 50-Mc. Emergency Net in Huntington. Active members of the net are LSJ, FUM, GQJ, EZR, HRU, AHF, LBN, and club station KEF. The frequencies are 50.72 and 50.8 Mc. IYG has his kw. rig working very well. FUM is QRL getting things set up for its AREC-RACES Net. The hobby show in Morgantown provided lots of traffic for the nets. FMU has a pair of 813s about ready to go. BKL is plugging away at his 144-Mc. schedules very successfully and is building a converter for that band. MBA is very QRL school. The MARA continues to be a very active club. RKV is the new president of the Tri-City Club. Thanks for the excellent cooperation this month in submitting activities information. Traffic: W8JWX 232, GEP 118, HZA 99, IXG 81, ETF 29, FUM 16, NYH 14, IYG 10, FMU 9, MBA 8, KDQ 7, PQQ 6, QWU 3, RRD 3.

### ROCKY MOUNTAIN DIVISION

**COLORADO** — SCM, Karl Brueggeman, W0CDX — SEC: MMT, RMs: KQD and KHQ, PAM: IUF, K0WBB, W6PKL/8, W0CYT, EKQ, BEN, KHQ, and KQD now hold TCC appointments. Our Colorado Slow Speed Net is going real well, with an average session attendance of about 6. TVI won the fur-lined soup dish for a perfect attendance record. Remember, the Net meets Mon., Wed., and Fri. on 3570 kc. at 1715 MST. KQD received her BPL medallion. It is the only one in Colorado so far. We all want to give IC and BWJ a vote of thanks for the work they have done on the license plate legislation. They have been most active and have represented our group at the Statehouse. It also is most gratifying the way everybody has cooperated and worked to get our bill through the legislature. WVZ was working in Alamosa and Monte Vista during January. OYS heard ZLIBY on 160 meters but could not make him answer. The Hi-Noon Net handled 219 messages in 22 sessions. Some of the appointments in the section are due to expire so I would appreciate it if all of you would check your appointment and if it has expired or is about to do so, send in your certificates for renewal. Traffic: K0WBB 889, W0KQD 248, LNH 27, PGN 18, SWK 17, IA 11.

**UTAH** — SCM, Floyd L. Hinshaw, W7UTM — NVY is the sparkplug for the new call letter license plate bill which has been introduced in Utah Legislature. SAZ advises the Ogden Annual Club Dinner was a big success with about 60 in attendance. Director 0IC came over from Denver and renewed acquaintances. Officials of Salt Lake City and Salt Lake County are holding conferences to determine the feasibility of consolidating c.d. activities. JVA has a new 2-meter transmitter at 90 watts. SP is occupied with a complete rebuilding program of his h.f. gear and is only on the air on 2 meters and DCS frequencies. NOE has transferred to Hollywood and has been assigned his old call, 6LXI. Congratulations to WRV on receipt of his General Class license. NVY is using a model 26 printer on 40-80-meter RTTY and has results from NY to KH6-Land. Art also has 700 watts on 2 meters. Winners in the SLC Club membership drive were JVA and BRV. LKM is offering free instruction to prospective hams who wish to learn the fundamentals of radio. Those interested call Salt Lake City AM 6-2897. Traffic: W7PIM 78, UTM 3, QWH 2.

**WYOMING** — SCM, Wallace J. Ritter, W7PKX — The Wyoming Pony Express gang is working hard on the license plate bill. The outlook at present is very doubtful because of opposition in the House after a vote of twenty for and seven against in the Senate. The Sheridan Radio Club now has a Radio Officer appointed. C.d. officials have appointed a Communications Officer. We expect the RACES authorizations to start in the near future. TZK, at Aladin, is a welcome newcomer to the 75-meter groups and to the Pony Express Net. The Casper Radio club house is nearing completion and sounds very nice. UZP is back mobile on 75 meters with a Commander. PAV, the SEC, is getting the ECs lined up after some delay because of illness. Nominations for SCM are now being solicited for the coming term. We are looking for volunteers for OO and ORS appointments. Traffic: W7PKX 188, PAV 23, LLP 18, PMA 14, PAW 8.

### SOUTHEASTERN DIVISION

**ALABAMA** — SCM, Joe A. Shannon, W4MI — SEC: TKL, RM: KIX. PAMs: RNK and EBD. New appointments: NLB and PAC as ECs. Activity is picking up in Jasper. CIU reports the following active stations: CIU, BWG, DDH, WN4s HPE, BAE, and KN4s BBM, BFF.

**VIBRAPOWR COMPANY**

4036 N. Rockwell St. • Chicago 18, Ill.

and BEX. KN4s BOJ and BOX are new in Anniston. Three clubs have new officers: Anniston — BCU, pres.; SCM, vice-pres.; OAO, secy.-treas. Montgomery — HKK, pres.; IVC, vice-pres.; and FMW, secy.-treas. Tuscaloosa — HCV, pres.; HFK, vice-pres.; and MI, secy.-treas. K4FDY has RTTY working fine and racks up high traffic totals. UHA was designated MARS "Station of the Month" for December for "exceptional participation." COU has new SA with clipper and now is working on s.s.b. exciter. ZSQ took a delayed vacation, hamming on the way. He put in some time coaching KN4s AOZ and APF (OM, XYL) for General Class. YRO reports the following new officers of the Muscle Shoals Club: ZSH, pres.; VRC, vice-pres.; CMK, secy.-treas.; MEM, trustee. OAO is instructor in the Anniston Club sponsored code class. Traffic: (Jan.) K4FDY 1332, W4UHA 513, COU 287, ZSQ 186, WOG 88, KIX 77, YRO 66, PWS 46, AAN 38, TKL 38, HKK 28, ZSH 27, K4ACO 26, W4OAO 23, TXO 14, CAH 9, EJZ 8, USM 2, VLY 2. (Dec.) W4ZSP 110, WHW 19.

**EASTERN FLORIDA** — SCM, John W. Hollister, jr., W4FWZ — RACES as of Jan. 31st: Approved are Leon, Volusia, Pinellas, Lake, and Hillsboro. Planning are Sarasota, Manatee, Broward, Orange, and Brevard. NHN Bulletin #3: Try 3660 kc. for the NHN generals at 2230 nightly for round tables. Traffic total was 41. SDR is an ANCS. The "N" was dropped by FXP, FJE, and EHW. BKC is secretary of the Orlando Club. Use the NHN for traffic on 3725 kc. Sun. at 0800. *Bird Sparks*: UWP is using a Globe Scout 55; AZO has a code class going on the air; SRZ is s.s.b., as is PQ; IL is using 32V-3; ZPO uses a mini beam on 20 meters; NJM needs a cat. AREC: 1M reports 479 members now. IYT, Dade EC, has 149 with 40 mobiles; FIQ, of Cocoa, and YNM, of Lake City, showed big gains in January. Ft. Lauderdale: Fixed and mobile stations worked again this year with the Mothers March of Dimes. Gainesville: New club officers are TJU, WEM, TKE, K4AQR, and WN4AZB. Jacksonville: NavAir Club (W4NEK) officers are TVN, WSK, NRC, and CNC. The main activity is skeds with KG4, KZ5, VO2, KP4, VP9, CNS, ZB1, and KH6 and equipment is 75A-2A, HQ-129, NC-173, Globe King, T350-XM. FMZ and PNA are back in Jacksonville. Key West: ELS says the club at NAS is K4NCN. DRT says the emergency net is on 29,080 kc. each Wed. at 1930. Lake City: The "N" was dropped by CYG, EGS, and EGY. New Novices: KN4BKZ, KN4BNO, and KN4BOS. K4BLB is serious about 220 Mc. Miami: PBS says the DEN planning committee is IYT, VYU, VZC, PBS, YCL, IQF, ZPO, and UIW. PBS uses a 'scope for modulation checks. EHW works 3 c.w. section net for operating experience. DNU uses a Viking Ad to drive 400-watt 813 final and LVV's HRO on 20/40-Mc. c.w. He and FGO and WN4HUP are working on Novice Net plans for 40/80 Mc. DNU is in charge of Marine Reserve station (BC-610 and BC-348R). Using Telrex mini beams are KMY and PBS. The DEN member certificate was designed by YCL. Ocala: DVR uses radiomarine rig from MARS. St. Augustine: FJE uses a Globe Scout with Heathkit VFO. Traffic: (Jan.) W4JFU 536, DVR 150, IYT 136, HQ 116, WS 109, LAP 89, WEO 75, ELS 52, K4ANJ 49, W4RWM 49, TJU 46, LMT 42, DSC 19, FSS 18, DES 11, FWZ 11, WHK 10, DNU 9, FJE 9, PBS 8, HFR 6, EHW 2, WEM 2, IM 1. (Dec.) W4DNU 8.

**WESTERN FLORIDA** — SCM, Edward J. Collins, W4MS/RE — SEC: FLE. ECs: MFY and HIZ. AXP has joined RACES. PLE is working hard to stimulate interest in emergency units. HJA is going in for hi-fi. BGG meets the Gulf Coast Hurricane Net. GMS is building a 75-meter beam. QK has 813s perking FB on 75 meters. CCY is going real high power for DX. JPD works them hand over fist with the B&W 5100. BGO is working s.s.b. over Quincy way. RMO keeps the Fish Net perking. UYS and UUF keep a close watch on 14 Mc. KN4AGM is studying for Technician Class exam. PAA has a 32V-3 perking on 15 meters. MIX is heard on 20-meter 'phone. TTM/PTK have a new porthole radio. BFD is interested in ham-TV. AIA is a nightowl with a B&W 5100. MS is enjoying s.s.b. on 20 meters. ZPL is getting out FB with a vertical. IASY/4 is heard in the Pensy Area. EAR is having modulator trouble. ECT says FJR is becoming interested again. NOX/NYZ keep the rig perking out Bohemia Way. HQG gets out FB with low power. CDE is heard on 75 meters in the wee sma' hours. NN is out of the hospital and getting on FB. QU meets USNR Net drills. Traffic: K4AKP 111.

**GEORGIA** — SCM, George W. Parker, W4NS — SEC: OPE. PAMs: ACH and LXE. RMs: MTS and OCG. Nets: Georgia Cracker Emergency Net meets on 3995 kc. Sun. at 0830, Tues. and Thurs. at 1830 EST; Georgia State Net (GSN) 3590 kc. Mon., Wed., and Fri. at 1900 EST. YTO is new NCS for the Atlanta 40-Meter Net and the new frequency is 7040 kc. 5RDP/4 has been transferred from Warner Robins, and ZLS is taking over as EC for Houston County. Norm has done a fine job organizing the AREC in his community and we wish him well in his duties. YRX is going great guns with a converted ARC-5 on 75-meter mobile. 601E/4 has a new Viking Ranger on the air and working fine. ERA is working 75 meters and MARS with ¾ (Yep, three-quarters) watts input. CFJ, ZD, NS, and others have a 420-Mc. Net set up in Atlanta, using converted surplus rigs. A 160 "Flea Power" Net now is going at Camp

## 'ADVENTURER' Transmitter 50 Watts Power Input

A really exciting, low-cost transmitter kit with enough features to interest the experienced ham as well as the novice. Completely self-contained with single-knob bandswitching and effective TVI suppression—operates crystal or external VFO. Employs 6AG7 oscillator, 807 power output and 5U4G rectifier. Covers 80, 40, 20, 15 and 10-11 meter bands.

Pi-section output network eliminates need for antenna tuner. Power supply delivers 450 vdc at 150 ma and 6.3v ac at 2 amps. Receptacle permits this supply to be used with other equipment when xmitr is not in use. Metering is provided for final amplifier plate and grid currents. Front-of-panel controls include: oscillator tuning, band-switch, amplifier tuning, coarse coupling switch, fine coupling, on/off, meter switch, key jack and crystal receptacle.

Detailed step-by-step instructions are included for wiring, no drilling or punching is necessary, and all necessary parts and hardware are furnished.

Complete with tubes, less crystals and key **\$54.95**

## HY-LITE SKY-CASTER Antennas

Structural strength and high efficiency are the outstanding features of these antennas. Have 3" diameter aluminum alloy booms. Elements are made of 1 1/2- and 1 3/8-inch aluminum tubing and are mounted to the boom with special cast aluminum clamps. Two feet of 2 3/8" pipe are furnished threaded to fit flange or mast.

### 20-Meter SKY-CASTER ANTENNAS

SC20M2	2-elements. 6db Gain. 15db front-to-back. 8' boom. 35 lbs.	\$ 85.00
SC20M3	3-elements. 9db Gain. 25db front-to-back. 16' boom. 55 lbs.	115.00
SC20M4	4-elements. 10db Gain. 30db front-to-back. 24' boom. 80 lbs.	155.00
SC20M5	5-elements. 12db Gain. 35db front-to-back. 32' boom. 100 lbs.	220.00

Each antenna is factory pre-tuned. Element lengths are adjustable and calibrated for center of bands. Supplied with T-match fed from a Balun made of RG8/U cable and fitted with coax connectors.

Also available for 15 meters

FOR PROMPT RESULTS SEND AIR MAIL

Gordon. DNT has left Cedartown. ZDP is back on the air with an 813. FZO has a new three-element beam for 15 meters. MA has been off the air lately because of illness. Seventeen prospective hams reported for the code and theory classes sponsored by the Atlanta Radio Club. ZD and MTS are the professors. The Charles E. Newton, Jr., Radio Club held its first meeting in Griffin and elected AFG, pres.; CZS, vice-pres.; HAO, secy.-treas.; OQT, act. mgr. The club is named for the late Charles E. Newton, Jr., W4TNT. Traffic: K4WAR 1302, W4OCG 97, PIM 94, IMQ 92, CFJ 89, ZDP 67, MTS 40, NS 38, ZD 20, BWD 16, ZWT 7, FZO 4.

**WEST INDIES**—SCM, William Werner, KP4DJ—SEC: IIZ. For the DX Contest DV had a kw. on 80, 40, and 20 meters; 200 watts on 160 meters; and 60 watts on 15 and 10 meters. ZW handles traffic on TXN at 2100 AST on 7160 kc. KD and CC are concentrating on 3.5-Me. DX while the season lasts. KD worked ZC4JA and LZ1KDP on 3.5 Me. WP1AAA has new vertical phenomenal on 3.7 and 7 Me. WP4ZC is now KP4. WP4ZT has a new Viking 1 net on 3740 kc. KD and CC are concentrating on 3.5-Me. DX while the season lasts. KD worked ZC4JA and LZ1KDP on 3.5 Me. WP1AAA has new vertical phenomenal on 3.7 and 7 Me. WP4ZC is now KP4. WP4ZT has a new Viking 1 net on 3740 kc., contact WP4ABA for details. US replaced cathode modulation with Class B plate modulation. MO is operator at MARS KP4USA. IIZ and CX are checking 144 Mc. from Monte del Estado near Mayaguez. ZN took down the 80-meter antenna and put up a 40-meter folded dipole and 20-meter Telrex beam. WT's receiving antenna is 60 feet of wire zigzagged in the room. MV and RK built Telrex-type beams. WL again is on 3925 kc. YI writes he now is W1CHC. IY moved to Seattle. DM is moving to Miami. WN, our 3925-kc. OBS, soon will have a 500-watt Globe King. W6C1W/KP4 is commander and industrial relations manager at Naval Air station and will be on with a 32V-3 and 75A-3. AZ and GX are building s.s.b. transmitters. KV4AA has a new Globe King. WAC at N.G. headquarters, and other KP4s throughout the Island participated in maneuvers handling military traffic on 3885 kc. so well that amateur radio has been incorporated into N.G.'s Emergency Plan. Traffic: KP4ZW 28, DV 4.

**CANAL ZONE**—SCM, Roger M. Howe, KZ5RM—QA is the new EC for the Atlantic Side, UD having resigned. DG had a visit from Smoky, W6UXN/MM, while the tuna clipper *Sea Prince* was in port for a Panama bait-fishing license. Also W6QDD, of Malibu, Calif., dropped in on DG. WA has installed a new cubical quad for 10 meters. In August 1954 the *SS Mataroa* had a run-in with the bank of the "Big Ditch" and was dock-bound for several days for repairs. On board was Tom, ZL3JX, who had a very nice collection of color slides of the Coronation and other interesting scenes in England. Tom was entertained by the KZ5 gang during his enforced sojourn here and as a token of his gratitude he sent us about 70 pounds of fresh-killed New Zealand pig. Recently the gang got together at the home of FL and enjoyed an excellent barbecue with the New Zealand pig playing the lead role. Traffic: KZ5WA 114, DG 95, KA 45.

### SOUTHWESTERN DIVISION

**LOS ANGELES**—SCM, Howard C. Bellman, W6YVJ—Asst. SCMs: William G. Coe, 6KWQ; and Henry G. Garman, 6BHG. SEC: QJW. PAM: PIB. We are sporting a newly-endorsed RM, GJP. We have 8 Asst. SECs, who also act as part of the 34 ECs in the section. Six amateurs are OBS, 5 are OES, 5 are OPS, and we have 12 ORS. The latest total of OOs is 12. The appointees included above rightly deserve their certificates; there is no "dead wood" listed. ORS who failed to report twice in 1954 without good reason have been cancelled. JJU is sporting new QSL cards sent from General Electric for his 1952 Edison Radio Amateur Award. K6DGW wants someone to start a KN6 QSL Bureau. K6AUZ has just moved in from the Santa Barbara section. On Jan. 30th we had a get-together at the Morris Cafe in Alhambra for the quarterly Traffic Breakfast, with W6ORS as chairman. Representatives of SCN, MTN, ALN, UTL, RN6, and MCAN-4 attended. Also attending was QR from Hemet. The next Breakfast will be run by USY. The 28th was made nicer by the free dinner at the Biltmore Hotel by the house of Weatherford, who handle radio parts and who serve the valley. When "City at Night" visited the Beverly Hills YMCA, they televised all aspects of the "Y" including an amateur radio station with NJU at the mike. Gary reports a new 15-meter beam at his place. EBK is running 300 watts a.m. and 700 s.s.b. to a 304TL final. MLZ is our new ORS. Ray has just passed around copies of the Cooperative Interference Committee Directory, listing 120 members in the 11th Radio District who have indicated their desire to assist the FCC and other agencies in the "reduction, or suppression, of interference in the community or area we serve." LVQ reports that YUY is the new president of the Whittier Radio 50 Club. K6COP has added a crystal calibrator and a Heathkit grid-dip meter to his station. "Some old boy," according to K6BEQ, is bootlegging his call on 40 and 75 meters. LXI has been reissued to its original owner, George R. Cannon, who is a TV engineer for NBC in Hollywood. He recently was on the air from the KSL transmitter at Saltair, Utah, under the call of 7NOE but is now living in Pasadena. CK was on emergency power 3 hours in January.

## NO TUNING CONTROLS, Servos Or Moving Parts

Radio Shack is proud to be one of the FIRST to stock Central Electronics' revolutionary new Linear that's destined to change the entire concept of RF amplifier design in the military, commercial and amateur fields! Requires no tuning on any band — the only control, other than the normal "off-on" switch function is a band-switching covering 10 through 160 meters! Order No. 35-186Q.

- Single 813 in Class AB<sub>2</sub>.
- New band-pass couplers provide high linear efficiency: 60 to 50%.
- Designed for 50 — 70 ohm co-axial input and output.
- Easy to drive — Approx. 2 watts effective or 4 watts peak envelope drive power required for 500 watts DC input.
- Built-in power supply — bias and screen regulation, 45 mfd oil filled paper output capacitor. Excellent static and dynamic regulation.
- Extremely intermodulation distortion.
- Automatic relay protects 813 and RF couplers.
- Excellent stability — complete freedom from parasitics.
- Effectively TVI suppressed — RF compartments thoroughly shielded and bypassed.
- Table model size: 14 1/2" W, 8 3/4" H, 13" D.

*Exclusive*

(Dec.) W6TRF 40, K6DGW 26, W6NTN 1.

**ARIZONA** — SCM, Albert H. Steinbrecher, W7LVR — Asst. SCMs: Kenneth P. Cole, 7QZH; Dr. John A. Stewart, 7SX. SEC: VRB, PAM: KOY, Arizona "Phone Net: Tue. and Thurs., 7 P.M., 3865 kc. Arizona C.W. Net: Tue. and Thurs., 8 P.M., 3690 kc. The outstanding activity of January was the participation of Phoenix amateurs in maintaining communications for the March of Dimes Campaign, sponsored by the Phoenix Junior Chamber of Commerce. Radio station KONI was on the air for 24 hours soliciting funds. As pledges were telephoned in to that station, UNL, working as an F/P with NYN, VKO, and RBA as fixed field stations, relayed the information to mobiles, who in turn sent out members of the Phoenix Hot Rod Club to pick up the donations. Besides the above, the following participated as mobiles: KOY, MOF, OIF, OQF, OSM, PMQ, SUL, UCA, UDI, and WTZ, aided by CJ, GUJ, IRX, KWB, LXX, MAE, NEL, OUE, PUP, QZH, QZX, RIJ, SUI, XP, SYV, UXZ, UYA, VMO, VMP, VMO, YFG, and 80VI. We welcome 9CZR and 5PHQ to Arizona. QFQ has a new home-built 60-watt mobile. *Remember:* The Montezuma Well Hamfest will be held May 21 and 22. Contact GYK or OAS for tickets and information. Have you made application for your Arizona call letter license plates? Traffic: W7UNL 392, RBA 96, VKO 92, KOY 38, SUL 32, QFQ 30, LQB 24, LVR 17.

**SAN DIEGO** — SCM, Don Stansifer, W6LRU — Asst. SCMs: Tom Wells, 6EWU; Shelley Trotter, 6BAM; Dick Huddleston, 6DLN. SEC: VFT. ECs: BAO, BZC, DLN, HFQ, HIL, HRI, IBS, KSI, KUU, and WYA. RM: ELQ. The big news is that Ben Hamilton, VFT, SEC for the San Diego section, won the G.E. Edison Radio Amateur Award for 1954. New TVI chairman is K6AEI, new secretary is K6AWF. Ex-K6DY now is W4EF in Florida and is looking for San Diego contacts. 3MSK/6 will be active in the area for six months. 4KRR was a visitor at the DX meeting in January. K6ILO, ex-KP4IV, 2ZAN, and 3ZAN, now is ORS in La Mesa. K2HMT now lives in Solana Beach and plans early 2-meter activity. K6ADA, vice-pres. of the Teen-age Drag Net, now is a member of the Naval Reserve. IAB and YDK attended the Southern California Trafficers breakfast. K6BTO has been reappointed OES in the South Bay Area. Ex-4VZH now is K6JOF in Del Mar. KN6JGI is a new licensee in Vista. Ex-K6BIG now is W8TKA. USZ is mobile on 21 Mc. CAE has converted his two-element 40-meter beam into a four-element 20 for the DX contest. CHV and CRT battled it out for section honors in the recent CD Party. KN6ITB was elected president of the Dana Jr. High student body, and promptly passed his Technician Class test. LRU is a new member of the Helix Club. All clubs are showing much activity preparing for Field Day. KL7AUV was a recent visitor. The Helix Club presented VFT with a large piece of luggage prior to his trip East to receive the Edison award. The following were active in the DX Contest on c.w.: K6EC, DGB, W6BZE, CAE, CHV, CRT, FFD, GBG, KSN, LRU, MGT, and W3MSK/6. BZE attended the DX meeting in Fresno. Traffic: W6IAB 3163, BSD 770, YDK 698, IZG 171, KVB 11, K6HZO 6, W6CRT 4.

**SANTA BARBARA** — SCM, Vincent J. Haggerty, W6IOX — NKT, in the San Luis Obispo Area, is quite active in his capacity as Official Observer. ZND is reportedly working on a new shack. FNP recently visited the radio club at Paso Robles. K6NBI and FYW were the only traffic reporters for the month. PP delivered K6NBI's traffic report to the SCM. Traffic: K6NBI 128, W6FYW 5.

## WEST GULF DIVISION

**NORTHERN TEXAS** — SCM, T. Bruce Craig, W5JQD — SEC: RRM: PAMs: PAK and IWQ. RMs: PCN and QHL. WN5FBY reports working c.w. from his car. The *Dallas 10 Meter Net Bulletin* of Feb. 5th gives information on civil defense drills and meetings, also a Chili Supper at the home of UHV. The Dallas Amateur Radio Club began code classes in November and on Jan. 7th graduated 26 out of the 143 who started. The Sweetwater Amateur Radio Club put on a demonstration of amateur radio for the Lions Club. DTA/5 needs only Delaware and Wyoming for WAS on 75 meters. UUR is looking for conversion data on R-28/ARC-5, and T-23X/ARC-5. YPI still is rebuilding his big rig, but is working all over the country on 5 watts. SFA has a new baby girl. DNY is rebuilding his 813 rig for built-in VFO. HKF has had his ticket two months and has worked 29 states with 20 confirmed with 50 watts on 75 meters. AFY, APW, DRV, AFR, and OFV have new Viking Ranger rigs. 9PIM/5 of Perrin Field, Sherman, has a new son. PWS has a 20-meter Cubical Quad. GFN lost her brother during Christmas. BDB is back in Dallas. RHP monitors the 3960-kc. Traffic Net regularly, with little

traffic for Tyler. The Panhandle Amateur Radio Club held its Christmas party at the home of CKB in Amarillo. Reports have been received of amateurs assisting in the March of Dimes Drives in Longview, Amarillo, and Abilene. Traffic: W5TGU 1717, KPB 615, BKH 556, CF 141, UBW 128, PAK 121, K5FFB 119, W5AHC 63, BAT 54, ACK 32, DTA/5 29, YKE 21, OCV 19, ASA 18, WNK 14, UTR 13, NTO 12.

**OKLAHOMA** — SCM, Dr. Will G. Crandall, W5RST — Asst. SCM; Ewing Canady, 5GIQ, SEC; KY, RM; GVS. PAMs: PML, SVR, and ROZ. OLZ, the Oklahoma c.w. traffic net (3682.5 kc.) is taking a new lease on life, with GVS as RM and with the help of JXM at Oklahoma University on TC, and is putting out a regular bulletin of interest to net members and others. The Aeronautical Center ARC has 100 per cent ARRL membership. Only one Novice reported this month, W5JUR, Lamont. The others are getting their General Class licenses like ERV, IPQ, HPW, and EJU. The ACARC, Oklahoma City, had a barbecue dinner for members and an open house afterwards with good attendance. Director CF, SCM RST, and SEC KY were there and some short informative talks and vis-a-vis ragchews resulted. The Shawnee Radio Club's new officers are NMN, coordinator, GNO, asst. coordinator, WSM, secy-treas. The Club meets on 3825 to 3840 kc. the 2nd and 4th Wed. at 2000 hours. Honorary membership certificates in the Shawnee Radio Indian Tribe are available to any amateur contacting five members of the Club. There is a new radio club in Grant County named Tom Cat Alley. The Club consists of BCI, CYQ, WN5FWP, WN5JUR, WN5CYZ, W5QJ, and other Grant County prospective amateurs. Traffic: (Jan.) W5GVS 146, MRK 102, QAC 71, ZKK 60, SVR 59, RST 41, TKI 33, MGK 27, PML 26, FEC 17, PNG 17, WSM 16, CBY 15, VBD 15, LDM 13, TC 13, ADC 12, GXH 12, ITF 10, GIQ 9, WTC 8, SWJ 7, UTC 5, EHC 4, REC 3, CYQ 2, LWG 2.

**SOUTHERN TEXAS** — SCM, Dr. Charles Fergaghieb, W5JIF — WN5JVD is working on a new deluxe rig with a pair of 6146s to be used at school in W7-Land. The problem is that 110 volts d.c. is all that is available. LSE is talking about s.s.b. and a.m. He is building kw. rigs for both. What I can't understand is that he is a c.w. man. ABQ, while recuperating from a severe heart attack, operated a 75-watt bedside rig on 20, 40, and 80 meters and enjoyed meeting old friends and handling some traffic to pass the time. This is the second year he has been confined to a bedside rig. Jerry says it renews his old feeling toward ham radio. CE is building an 813 rig so small it will go in a hat — a 10-gallon hat, that is. FDZ, ADZ, URU, and EJJ were overheard talking about the Sheriff's posse. DUG, NCS for CERN, is going strong on 420 Mc. FND is giving programs on "car-emitted speech." KQG, NCS for SARC Emergency Net, wants more activity on the Net, which meets at 6 P.M. every Thurs. QCH is hiding transmitters again. Bill Case, Paul Tarradaychick, Bro. Bill Hamm, Andy Crockett, Derwin King, and Willard Carmack recently attended the IRE Convention. SDA has a new ham shack. Traffic: W5MIN 504, ABQ 29.

**NEW MEXICO** — SCM, G. Merton Sayre, W5ZU — SEC: KCW, PAM: BIW, V.H.F. PAM: FPB, RM: JZT. The NMIEPN meets on 3838 kc. Tue, and Thurs. at 1700. Sun. at 0730; NAI Breakfast Club every morning except Sun. at 0700-0900 on 3838 kc.; NM C.W. Net daily on 3633 kc. at 1900. Because of long skip and QRM, the Tue. and Thurs. net has moved up to 1700. The Amateur Radio Caravan Club of New Mexico is sponsoring the New Mexico State Ham Picnic at Albuquerque June 4-5, with the Albuquerque Chapter in charge. In order to secure the choice of Ruidoso in 1956 for the West Gulf Division, New Mexico amateurs should plan on a large and vociferous delegation to the West Gulf Division Convention at Fort Worth June 10-12. CIN reports a new c.d. director has been named for San Juan County. QR and CEE are checking into PAN, AK, ARD, AWR, CAZ, EAP, GYN, PGJ, SUF, and SZM recently received Section Net certificates. FAG, FPB, WIY, CGE, ECS, DFJ, YXM, DED, UEO, HAG, DNK, FJE, WBA, EEM, FMX, OIA, IUE, and NSJ ranked in that order in the January V.H.F. Sweepstakes, with HGV, BXS, PQA, WNL, EDK, HLE, and 3KNW/5 also active. 0AZE/5 is a recent add-on on 144 Mc. Traffic: W5QR 75, AQQ 32, HJF 22, ZU 21, CEF 18, JZT 14, SZM 12, BAG 7, BZA 7, ARD 5, BZB 4, GEM 4, WBC 4, BXP 2.

## CANADIAN DIVISION

**MARITIME** — SCM, Douglas C. Johnson, VE1OM — Asst. SCM: Fritz A. Webb, 1DB. SEC: RR, RM: VE1HJ and VO6N. PAMs: VE1OC, VO2AW, and VO6N. ECs: VE1AAY, VE1DQ, VO2G, and VO6U. A new appointee is DW, EC for Yarmouth. Bouquets to the NBARA for a successful VE1 Contest on Jan 29th and 30th. The Dartmouth ARC is conducting code and theory instruction for newcomers. RN, XK, and UM are sporting new Viking Rangers. A visitor to Halifax was VE2LI (ex-G5LI). AAY, Fredericton EC, reports 7 Full and 2 Supporting Members of AREC. HJ and OM are QRL week nights with traffic on TRN. TA is building s.s.c. exciter. WL worked four new countries in the BERU Contest. BN is all set, having completed an all-band exciter and raised 3 antennas. PX and

— — • —

BOB CHEEK . . . WHO HAS BEEN A "HAM" FOR 23 YEARS AND OPERATES W3LOE . . . IS ASSISTANT MANAGER OF THE ENGINEERING DEPARTMENT AT THE WESTINGHOUSE ELECTRONICS DIVISION.

## WITH AN IMPORTANT MESSAGE FOR ALL ELECTRONIC ENGINEERS!

You may have heard Bob Cheek on the DX bands during the recent DX contest. Bob is a ham of 23 years standing, and is recognized as an outstanding DX operator, both phone and CW. Like many hams, Bob finds that his "rig" is relaxing and educational . . . and as stimulating as his work on advanced development projects at the Westinghouse Electronics Division.

Can a job be as interesting as a hobby? Bob says it can! "At Westinghouse," he contends, "the combination of professional surroundings, creative freedom and challenging 'projects of tomorrow' has put me in a real 'engineer's heaven'! In addition, the income and employe benefits, fine suburban living conditions, and so forth have helped both myself and my family achieve many of our

lifetime goals while we are still young enough to enjoy them!" For the expansion of work on the interesting projects mentioned by Bob Cheek, Westinghouse needs still more experienced electronics engineers. If you have an engineering degree and would like more information on top-level openings to be filled in the near future . . . drop us a line today! All replies will be treated with the strictest confidence!

# Now! A BETTER WAY TO STUDY FOR FCC LICENSE EXAMS

**ONLY \$5.00**  
No lessons  
to wait for

**New!**

## LICENSE MANUAL for RADIO OPERATORS

by J. Richard  
Johnson

**Answers almost 2200  
typical FCC examina-  
tion questions**

**A complete, practical guide  
to getting your "ticket" as  
a commercial operator for  
good-pay jobs in**

**COMMERCIAL RADIO OR  
TELEVISION STATIONS**

**SHIP OR MARINE RADIO**

**AIR LINE RADIO**

**COMMUNICATIONS, etc.**

**Train now for better  
pay in Radio-TV  
Communication's most  
interesting jobs!**

HERE, at last, is a low-priced book that gets right down to brass tacks in making it easier for you to get your commercial operator license and any one of the dozens of big-paying jobs it opens to you.

No lost time! No lessons to wait for! No unnecessary expense!

Johnson's LICENSE MANUAL FOR RADIO OPERATORS is a complete guide to FCC examination subjects... written so you can easily understand and remember it. It states the license examination questions... then gives you the answers, clearly and concisely.

Covers ALL EIGHT examination elements... not just a few of them. Reviews almost 2200 typical FCC examination questions with straight-to-the-point answers. Brings you full details of the latest communications subjects... and all other pertinent data from electrical-radio fundamentals to navigation and related subjects.

Anyone who has basic training as a serviceman, experimenter, amateur or engineer will find LICENSE MANUAL FOR RADIO OPERATORS the ideal training book for making this all-important step ahead in his career.

Whether you'd like to take the FCC exam for either your 1st or 2nd class phone or telegraph license, this big book will guide you all the way. A skilled instructor standing by your side could hardly do better!

FQ have been assisting DW as NCS on the Maritime 'Phone Net. VN has been working out on 160-meter 'phone. W4KVM is back in Virginia after a sojourn in V06-Land. SEC RR would like to see an Emergency Coordinator appointed and an Amateur Radio Emergency Corps formed in the following centers: Truro, Liverpool, New Glasgow, Middleton, Amherst, Sydney, Moncton, Saint John, Chatham, and Charlottetown. Any volunteers? V06N, Goose Bay ARC secretary, announces the annual Club QSO Party to be held from 0001Z Apr. 8th to 2400Z Apr. 11th, 20 hours operating permitted, contact total times provinces, states, and countries total for score. Log RST, date, time, and location. No interclub or net contacts count but multipliers of 2 for up-to-50 watts and 1½ for 50-100 watts input apply. Traffic: (Jan.) V06AH 207, VE1FQ 148, W4WOU/V01 132, V06N 132, V06B 79, VE1DW 67, VE1AV 58, VE1OC 45, V01T 42, V06AF 42, V06S 41, VE1HJ 25, VE1ME 24, VE1OM 19, V01AO 6, V01B 6, K6EJH/V02 5, VE1DB 2. (Dec.) VE1HJ 19.

ONTARIO — SCM, G. Eric Farquhar, VE3IA — Congratulations to Arnold Duke, popular secy. of the Quinte Club, on joining the ranks of married folks. Welcome to the Gateway Club of North Bay, now an ARRL affiliated club. 1955 executives are DM1, pres.; TX, vice-pres.; EAW, secy-treas. and editor. AZV demonstrated thyatron timing equipment at the West Side Club of Toronto. DXCC members are IIB with 126 countries and AIIV with 106. HB also has W.A.A. certificate with confirmations of 45 out of 57 countries. The v.h.f. contingent held an enjoyable affair at Oakville on the week end following the Sweepstakes. DMQ is on the air again. Highlight of the Ottawa Club meeting was an interesting talk and the showing of pictures by BBW, recently returned from Korea. Occupying new shacks are AAS and BCV. BSQ is making continued improvement after hospitalization. ATR, AJR, and DWG, on the Restricted Speed Net, 3645 kc. Sun. at 1330, solicit your participation. Originated to assist newcomers, this net deserves your support, which will determine its continuation. AVS, in Kapuskasing, reports the shack was rather cool Jan. 29th — just 42 below! AHL and BIW complete 10-meter walkie-talkies. BIW is EC for Windsor. To get away from QRMI, AOE packed the radio gear into the car and drove out to the country to enjoy a couple of hours operation in the recent CD Party. The London Amateur Radio Club, AJQ, pres.; meets the 2nd Thurs. of each month. Code classes are very popular. Bulletin editor TO welcomes the exchange of club bulletins. Congratulations to AD on the arrival of a jr. operator. NG, pres. of the Nortown Club, Toronto, has the distinction of being first to win the coveted ARRL BPL Medallion in this section. IL, communications officer for civil defense, was instrumental in the Nortown Club getting first-class quarters for meetings and operating facilities. Traffic: (Jan.) VE3BUR 182, AJR 132, GI 132, NG 102 TM 83, VZ 66, NO 12, CP 29, AUU 28, DQX 28, BJV 19, AVS 18, AOE 17, KM 13, IA 11, PH 8, DPV 5. (Dec.) VE3DPV 3.

QUEBEC — SCM, Gordon A. Lynn, VE2GL — The MARC elected TA, pres.; HY, 1st vice-pres. and treas.; CH, 2nd vice-pres.; and Ial Moray, secy.; with HI, AKT, AMA, and KS on the board. UM has returned from V06-Land and is active on 20 meters again. OO, formerly AM and before that RI, has a Viking II with VFO on 20, 40, and 80 meters. APA, ALR, ANB, JA, and TI are heard consistently on 75-meter 'phone as representing the Trois Rivières gang. ANK has 400 watts on c.w. from the same place. ADX, station of the South Shore Amateur Club, has an 814 transmitter with CR100 receiver and reports into the Ontario C.D. Net, also the local c.d. roll call each Sun. KG is rebuilding with an 833A in the final rig all shielded against TVI. II is active from Sherbrooke on the Green Mountain Net on 3860 kc. at noon. SS is experimenting on 10-meter 'phone for EC purposes and also reports into PQN. AKO, in Sherbrooke, is badly hit by TVI and gets only an odd QSO. DJ is new in Thetford Mines. AIE is reported knocking off some good DX on 160 meters. ANR is on 75-meter 'phone regularly from Bury. FL arranged a special AREC exercise on Jan. 23rd, with planning by AFQ and AEV, in which ABS, AFH, AJQ, OB, IIL, AIU, AFQ, AEV, IFL, ZB, AMY, VE3BJE, and VE3BZM took part. WW finally worked Asia on 80 meters for EAC on that band. CA reports increased traffic with the north country and makes BPL with originations plus deliveries. LO has converted the 1154 transmitter. Traffic: VE2CA 152, DR 143, II 106, BB 69, ATQ 16, LM 14, CP 12, EC 11, GL 11, FL 9, ADX 7.

ALBERTA — SCM, Sydney T. Jones, VE6MJ — PAM: OD. RM: NG. AL is building a frequency meter and is acting net control on PLN during the absence of XG, who is rebuilding his rig to clear TVI. Alberta has lost one of its oldest and best-known amateurs. Jessop Nott, VE6JJ, passed away on Jan. 28th. He will be sadly missed by all who knew him. YE still is working on that new high-powered rig. HM reports his new vest-pocket beam is working out well. WC reports better operating conditions in the south but claims traffic is slow. The Lethbridge gang has decided to stage the 1955 Alberta Hamfest. Let's not only support them by attending, but please let them know what you would like in the way of activities during the hamfest week end. Remember, it's your hamfest. NX has his new rig on

(OUTSIDE U.S.A. — Price \$5.50 cash with order. Money back if book is returned in 10 days.)

# Everybody's Talking About Our GLOBE KING!

*A Globe King transmitter was used in the Amateur Radio Booth at the recent State Fair of Texas. How did it operate? Here's what Mr. Edward F. Aymond, Jr. Amateur Day Committee Chairman, has to say:*

## THE 500 WATT Completely Bandswitching GLOBE KING

Here's an advanced design, high power transmitter of 500 watts input on both CW and tone 100% modulated. Is completely bandswitching 10 thru 160M. bands. Consists of FR, Speech Modulator and Dual Power Supply Sections. Entire unit is specially screened for TVI. Pi Network output matches any antenna from 52-600 ohms. Has provisions for VFO and Single Sideband input. Forced air-cooled 4-250 tube, push-to-talk, special aluminum mesh screening of RF Section — just a few of the many fine features. Enclosed in grey hammertone cabinet, 31" x 21 3/4" x 15".

**ONLY \$367<sup>8</sup>** per mo.

**\$67.50 DOWN**  
**CASH PRICE: \$675.00**

Edward F. Aymond, Jr.  
Dallas, Texas  
WSUHV

"... was operated on 14.228 mc for 16 days continuous from 10:00 a.m. till 10:00 p.m. Some 200 different amateurs used this transmitter and not once ... did we have any trouble whatsoever.

"... no interference either on the video or the sound as a result of the Globe King being operated in this close proximity (3 feet) to (two) television sets. During the operation at the Fair, 41 states were contacted, 5 of the Canadian Districts, Alaska, Hawaiian Islands, Canal Zone, Cuba, Nicaragua, Honduras, Peru, and Columbia. All operation was via phone.

"... we were more than pleased with this operation and wish this transmitter had belonged to one of us personally"

*and ...*

Dan Hoover (W9VEY) of Hillsboro, Illinois says, "It sure is a wonderful rig. QRM just melts and backs off to either side."

In the words of George H. Cooke (W2LOP) of 25 Cottler Ave., Springfield, N. J.: "... there is absolutely no interference on our own TV set ... Needless to say I'm very well satisfied with my purchase."

And from Don Smith, La Junta, Colorado: "I think you have topped the field ... I congratulate World Radio Labs for really turning out a FB rig!!! ... The modulation reports I get are 'The best sounding rig on the band OM what are you running?'"

## 65 WATT GLOBE SCOUT Completely Bandswitching

This excellent Xmtr. offers 65 watts input on CW, 50 watts on tone. Is completely bandswitching 10 thru 160M. Combination Pi Network antenna tuner. 100% modulation of Final. Housed in 8" x 16" x 8" grey cabinet.

Communications . . . and  
Radar Personnel  
Who Want To Earn

**\$7,000 Per Year**  
or **BETTER!**

## PHILCO TECH-REP DIVISION Offers Such Opportunities

. . . to men who are qualified by experience or training in the design, maintenance and instruction of Communications, Radar and Sonar Equipment.

### FUTURE OPPORTUNITY & JOB SECURITY

. . . are more than "sales talk" at Philco, where the continuous demand of electronics installation and service work throughout the entire world, which have been coming to us with increasing regularity since 1941, have made us the "pioneer" in this field.

### PLUS . . . OF COURSE

. . . the very important fact that in the civilian radio & television field, PHILCO has led the industry for 20 straight years.

### TOP COMPENSATION

. . . salary commensurate with education and experience PLUS hospitalization, group insurance, profit sharing, retirement benefits, merit and faithful service salary increases and paid vacations.

### LOCAL INTERVIEW ARRANGED

**Write NOW For**

. . . our special literature on COMMUNICATIONS & RADAR JOB OPPORTUNITIES NOW AVAILABLE AT PHILCO.

## PHILCO TECH-REP DIVISION

22nd & Lehigh Ave., Philadelphia 32, Pa.

the air and is gunning for the elusive DX. MJ is working 21-Mc., 'phone with fair results. LW has acquired an AT-1 transmitter and has plans for some modifications. Traffic: VE6HM 130, OD 17, MJ 6, WC 6, AL 3.

**BRITISH COLUMBIA** — SCM, Peter McIntyre, VE7JT — You didn't see anything in your QST column for January since "you no write, me no type." The hams at Dawson Creek are in full swing with emergency work in conjunction with the c.d. and the RCMP and the fellows at Kelowna were there with mobile and emergency gear when a hunter was lost in the mountains. Welcome to two new ECs, ADV in District 6, and AHJ, of Terrace, in District 14. District 2 on Vancouver Island now boasts 8 mobiles, namely ALL, BF, US, GP, DH, AOG, ACC, and PN. ASR, as RN7 manager, reports little activity because of poor band conditions. Congrats to AAH and his XYL on the birth of a jr. operator. Congrats to AUF and AQW and QC, who have been carrying the load on the AREC Net during the poor band conditions. If any VE5s or VE6s read this section we would appreciate their coöperation on 3755 kc. at AREC Net time. We know the frequency is not exclusively ours but think of all the free channels open during our hour of net time. We respect their net frequency of 3765 kc. so give a listen, fellows, before you start testing and bellowing. I hear the BCERARC is cooking up some new secret weapons for Field Day, including a new call, so be prepared. Traffic: VE7QC 55, ASR 23, DH 19, ZV 2.

**SASKATCHEWAN** — SCM, Harold R. Horn, VE5HR — **ADVANCE NOTICE** — The Saskatchewan Hamfest will be held at Saskatoon on July 1st week end. Plan now to attend. Get your gear in shape for the various events. Bring the family. More information will come. LJ and 6KZ/5 are active at Biggar. HJ is working in Edmonton for the winter. EO has a new NC-88 and is going to the U. S. A. for a new transmitter. YF is busy organizing hamfest details. WC visited the Saskatoon Club and attended its annual party. BD keeps 40-meter c.w. active during his spare time. MK is looking for Baker Lake contacts. FG has his scope working now and watches your signals. OB gets little time for ham radio; he is spending his spare time keeping CFQC-TV on the air. Reports have been very lean, fellows. Let's have some news so this column can be written. Officers of the Moose Jaw Club include AV, pres.; OM, vice-pres.; KG, treas.; and MG, secy. Traffic: (Jan.) VE5CW 39, MX 13, DS 7, HR 7, FG 6, CI 4, BF 2, GX 2. (Dec.) VE5CW 66.

## Jest Test

Anyone can become a radio amateur provided he or she has a/an

1. High Q of 100 or better
2. Aunt Enna to finance the rig
3. Code in the head
4. Key to the exam answers

Which person would most likely short-circuit a final tank?

1. Millie Ampere
2. Mr. D.C. Watts
3. Ol' Man Mhos
4. Mr. Gilbert Maxwell

Which of the following would constitute an excellent spot for a DX man?

1. A magnetic domain
2. An old peoples' ohm
3. A bandspread in Texas
4. A bus bar

Why is the average ham always broke?

1. His current expenses are high
2. His earning potential is low
3. His sales resistance is poor
4. He spends money to save phase

Medical history was made when Dr. Ima Ham discovered the surest cure for DX-itis to be a

1. Series of shocks in a cornfield
2. Penny behind the fuse
3. Magnetostriiction straitjackets
4. Bolt of lightning down an untuned line

What device will eliminate flies and mosquitoes in a hamshack?

1. A parasitic suppressor
2. A fly-back transformer
3. A screen dissipation network
4. A trigger circuit

zigzag symbol for inductance so that it could be used for resistance and the communication workers gave up the parallel lines for capacitance so it could be retained as a contact symbol.

Obviously, the power engineers could not immediately use the zigzag symbol for resistance because it already meant an inductance to them; so the two existing symbols for resistance had to be retained.

The communication inductance symbol is complicated and therefore expensive to draw with a drafting guide, and the small loops tend to fill with ink when a diagram is reduced to small size. The simpler form that omits these loops was accepted as a more practical alternative symbol.

Both groups gave up their capacitance symbols because the communication version was too much like the power open contacts and the power symbol had the same drafting and reduction faults as the communication inductance. There was considerable unhappiness over the compromise symbol that uses one curved and one straight line but it was the best that was thought of at the time, or since then.

Agreement could not be reached on a single symbol for electric contacts because the power group must have a very clear distinction between open and closed contacts and the communication group must be able to show a large number of contacts in a single compact assembly as is often required in telephone work. Both existing symbols were therefore retained.

Acceptance of the idea that we are using symbols, rather than pictograms of actual pieces of equipment, means that there need be no top or bottom for a symbol as there might be for a picture. Thus, a ground symbol may point toward the top or side of the drawing and the same is true of an antenna symbol, which might point toward the bottom of the sheet.

**Capacitance and Capacitors**

If you have stumbled over "capacitance" because you are accustomed to "capacity," please note that the unfamiliar form was used with malice aforethought. This is one technical matter in which the amateur has not been showing the way to the professional.

There are three basic elements: resistance, inductance, and capacitance; and they are provided by resistors, inductors, and capacitors.

Strictly speaking, capacity is the ability of a device to do work, and we should speak of the capacity of a vacuum tube as being so many watts. Its interelectrode capacitance will, of course, be stated in micromicrofarads or picofarads, which are the same things.

A condenser, again strictly speaking, is a device used with steam engines to condense the exhaust steam into hot water that is pumped back into the boiler. This saves fuel in heating

fresh water and reduces the amount of salt that gets into the boiler and causes corrosion. The electric device does not condense electricity but stores energy in the form of an electric field in a dielectric. Correspondingly, an inductor stores energy in a magnetic field.

Now, by drawing your attention to the page of preferred standard symbols that will hereafter be used in *QST*, this pedagogical character will gain that necessary interval of inattention in which he may silently close his typewriter and be gone.

## 6360 Dual Tetrode on 220 Mc.

(Continued from page 22)

form in the interest of simplicity. The actual connections for the power leads should be as shown in the main diagram, Fig. 1. The modulated plate voltage is brought in to Pin 6 on *P<sub>1</sub>*. A screen-current meter, or a jumper, should be

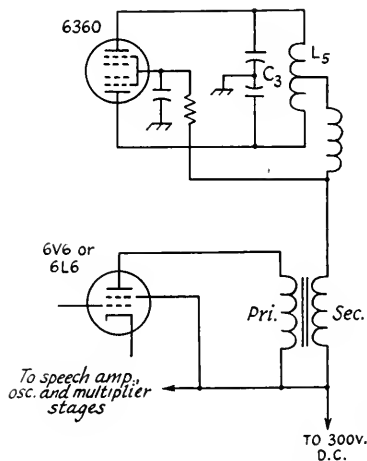

Fig. 3 — Simplified diagram showing how a modulator is connected to the final stage.

connected between Pins 6 and 7, and a plate meter or jumper between Pins 6 and 8.

A modulator of simple design that can be adapted readily to use with this transmitter was shown in *QST* for December, 1954, page 29. A 6L6 can be substituted for the 6V6GT shown in the original, if more audio power is required.

Power output at 300 volts is about 10 watts, which is enough to do interesting work on 220 Mc. if a good antenna system is used. Antenna ideas can be found in December, 1953, *QST*, or in any recent edition of either *The Radio Amateur's Handbook*, or the *ARRL Antenna Book*. The transmitter may also be used as a source of driving power for any of the larger dual tetrodes, such as the 6524, 6252, 5894 or 9903. The first two will take up to 50 watts input on 220 Mc., the latter two up to 100 watts or more.

... to pass FCC amateur exams

## LEARN CODE

and Theory

\$3.95  
up

EASY,  
FAST HOME STUDY

with 78 R.P.M. Phonograph Records

PASS COMMERCIAL AND AMATEUR CODE  
EXAMS, AMATEUR THEORY EXAMS, FOR  
YOUR FCC LICENSE!

4 AMECO Courses Available:

No. 1 — NOVICE CODE COURSE. You get and keep 10 recordings (alphabet through 8 W.P.M.). Includes typical FCC type code exams. Free instruction book on learning how to send and receive code the simplest, fastest way; plus charts to check your receiving accuracy; plus an album; all for the low price of only.....

\$7.95

No. 2 — SENIOR CODE COURSE. You get and keep everything given in the Novice Course except that you get 22 recordings (alphabet through 18 W.P.M.), plus typical FCC type code exams for General class and 2nd class commercial telegraph licenses. All this for only.....

\$12.95

No. 3 — COMPLETE RADIO THEORY COURSE. A complete, simplified home study theory course in radio covering the Novice, Technician, conditional and general classes — all under one cover — with nearly four hundred typical FCC type questions to prepare you for license exam. No technical background required. You also get, FREE, a guide to setting up your own Ham station. All for the amazing low, low price of.....

\$3.95

No. 4 — NEW ADVANCED COURSE. Prepares Novice operators for the amateur general class and second class commercial license tests. Contains 12 recordings (8 through 18 W.P.M.) PLUS the complete code book — PLUS typical F.C.C. code examinations for general and commercial tests. ALL for only.....

\$6.95

No. 5 — RADIO AMATEUR QUESTIONS & ANSWER LICENSE GUIDE. A "must" if preparing for Novice, Technician or general class exams. Approx. 200 questions & answers (most multiple choice type) similar to ones given on F.C.C. exams. Has 2 typical F.C.C. type exams. Other questions by subjects, easier to study. Low, low price of.....

\$5.00

## DELUXE CODE PRACTICE OSCILLATOR

In Kit Form  
or Wired

The AMECO Code Practice Oscillator, for 110 volts AC or DC, with a built-in 4 inch speaker, produces a pure, steady tone with no clicks or chirps. It can take a large number of headphones or keys. After the code has been learned, the AMECO code practice oscillator is easily converted to an excellent c.w. monitor.

Other features include:

- Variable tone control
- Volume control
- Sturdy grey hammertone cabinet
- Lowest prices

In Kit Form, with Instruction, less tubes (Model CPS-KL).....

\$11.75

Completely Wired & Tested, less tubes (Model CPS-WL).....

\$12.95

Set of two tubes (35W4 and 50C5).....

\$ 1.80

## BEST BUYS on BEST BRANDS

for Amateur and Industry

If you are a beginner, begin with the BEST at TERMINAL... the ham's favorite supplier. TERMINAL always stocks the newest and finest Ham Gear and Supplies; all standard Radio, TV, High Fidelity Audio and Sound Equipment for Home, Industry and Communications.

**FINEST SERVICE • LOWEST PRICES**

TERMINAL'S staff of active Amateurs and experienced Technicians are here to help you solve your problems... SAVE YOU MONEY and assure your Complete Satisfaction!

NEW!

## Johnson Viking ADVENTURER CW Transmitter Kit

Work round the world with the ADVENTURER... the perfect transmitter kit for both novice and experienced amateur. Completely self-contained.

Loaded with new features:

- Power Input — 50 Watts
- Effectively TVI suppressed
- Pi-network output tuning — no antenna tuner needed
- Single-Knob Bandswitching on 80, 40, 20, 15, 11 and 10 meters
- Extremely compact in size — only 7 3/4" high x 10 3/4" wide x 8 1/8" deep.

No. 240-181-1 VIKING ADVENTURER Kit with tubes, less crystals and key. Complete with easy assembly directions and operating instructions.

\$54.95

TERMINAL Regularly Stocks

these Famous JOHNSON Ham Favorites:—

Viking Ranger • Viking II • Viking VFO • Viking Mobile VFO • all in either Kit Form or factory wired • Johnson's Civilian Defense Viking II • Low Pass Filter • Standing Wave Ratio Bridge • Signal Sentry • Matchbox • Bi-Net and Whipload as well as Johnson parts. Contact W2BUS for information, data sheets and quotations.

## Director Beams

(Continued from page 24)

center, and the position of the taps for the transmission line should be made carefully for minimum standing-wave ratio. Both adjustments can be carried out experimentally by means of a power-indicating standing-wave meter. A suitable balun is shown in Fig. 1.

One of the 12-element beams, Fig. 3, has No. 12 wire on 2-inch spreaders (for high power) for the phasing lines. Each line was made the

Fig. 3 — A 12-element array having a gain of 13 db. The entire system may be fed through a single tuning stub as shown.

same length, and tapped at the exact center, so that each pair of driven elements would be in phase. The whole system was then resonated with a single shorted stub approximately 40 inches long. The balun taps were about  $5\frac{1}{4}$  inches up from the short in this case. The positions for the short and the taps were found by using a temporary stub about four feet long, sliding the shorting bar and the taps until maximum forward power and minimum reflected power were indicated on the s.w.r. meter.
